Volume 21. ..., 1915. Number 1.

THE FREDERICTON EXHIBITION.

The 1915 bi-ennial exhibition was held on the 20th to the 25th of September. The cold equinoxial gales and occasional showers that prevailed during the fair period were not conducive to a large attendance. Taking everything into consideration, however, the attendance was quite satisfactory. The display in the main building was as well staged as we have ever seen it at Fredericton, every available space was filled. At the rear of the hall the farmers and fruit-growers of the province made a splendid display of the products of the field, the garden apiary and the dairy.

The products of the field and garden were judged by S. J. Moore and B. V. Reid. B. Goodspeed, W. Illingworth and J. W. Smith & Sons, showed the largest and best collections of field roots. The best collections of garden vegetables were shown by J. Bebbington & Son, J. W. Smith & Son, and B. Goodspeed. There was keen competition in every section of the grain and vegetable classes. The fruit-growers made a big showing of the products of their orchards. The fruit was clean, well grown and attractive. A. G. Turney placed the awards. The best three boxes, one variety, were shown by W. B. Gilman, Mrs. Darcus, I. W. Stephenson and St. John Vallley Nurseries.

W. B. Gilman and F. E. & H. G. Smith showed the best barrel of apples and the best five baskets of apples suitable for window display.

The best collection, 10 varieties, apples, were shown by A. Sangster, Falmouth, N.S., W. B. Gilman, W. P & F. L. Fox and Mrs. Darcus.

The most effective displays made by farmers to advertise their apples in an attractive and distinctive way were made by A. R. Gorham, Grey's Mills and Mrs. Darcus, Fredericton.

A. R. Gorham and A. Sangster had the most artistic collections of fruits grown on any one farm.

One of the most attractive features of the fruit show was a large panel on the wall on which a Union Jack, a maple leaf for each Canadian province and territory and words "Canada will never let the old flag fall," was worked in apples, red, white, green and golden. We heard more favorable comments about this panel than about any other feature of the show. Mr. Turney and his assistants deserve a lot of credit for the originality and effectiveness of the display.

H. B. Durost, the enthusiastic provincial apiraist, was in charge of the apiarian products. The best display ever made in this line at Fredericton was brought together this year. Honey in the comb, in glass and in tins, totalled over three-quarters of a ton, all of which was tastily arranged.

C. W. McDougall had charge of demonstrations in butter and cheese making and not a few of the visitors to the fair watched how Mrs. Lester, the lady demonstrator, cleverly attended to the various details of the work.

The butter and cheese were judged by L. C. Daigle. Following are the awards:

BUTTER

Box of 56 lbs., creamery made—1, Fidele Vantour, St. Louis, N.B.; 2, J. H. Martin, Albertine; 3, Dunk River Dairying Co., P.E.I.

Twenty lbs. creamery prints.—1, J. H. Martin; 2, Dunk River Dairying Co.; 3, W. C. Lewis, Little Bass River N.S.

Crock or tub—1, Charles W. Parent, R.F.D. No. 4; 2, Miss A. Kirk, The Barony; 3, Mrs. N. A. Sterritt, Grey's Mills.

Box of prints, private dairy—1, C. W. Parent; 2, McFarlane Bros., Fox Harbor Point; 3, B. Goodspeed, Penniac.

Butter, fancy display—1, C. W. Parent; 2, Miss J. Staveley; 3, Miss A. Kirk, The Barony; 4, T. W. Smith, Durham Bridge; 5, Mrs. L. H. D. Foster, P.E.I.; 6, McFarlane Bros.

CHEESE

Factory made, not less than 60 lbs.—1, A. J. McGilvray, Sussex; 2, Archie Cousins, P.E.I.; 3, L. J. Murphy, Tignish.

Not less than 30 lbs., factory made.—1, A. J. McGilvray; 2, Archie Cousins; 3, L. J. Murphy.

10 lbs., private dairy—1, J. W. Stevenson; 2, C. W. Parent.

THE HORSES

There was a good showing of Clydesdale, Carriage, General Purpose, Heavy and Roadster Horses. The Clydesdale classes were particularly interesting. There were enough good horses below the money ranks that would make a creditable showing at any fair.

Wm. Graham, Claremont, Ont., and H. G. Boag, Barrie, Ontario, placed the awards in the Light and Heavy Horse classes resepctively.

Thoroughbreds—The aged stallion section of the Thoroughbred class brought out the horses, Ostrich, Melcino and Bendemeer. They were awarded prizes in the order named. Motorman, by Cyclist, was the only yearling. Geo. M. Holmes had the only Thoroughbred mare in the ring.

Standard Breds—Were few in number. Jewett's Tryfast led the aged stallion section with A Game of Chance by the Patchen Boy, and Roy Volo by Nervolo in second and third places. There was practically no competition in any other section of the Standardbred class.

Hackneys—Were all few in numbers. R. A. Snowball's Filgrave Royal John was the best aged stallion. W. M. Johnson, Newcastle, had the only brood mare with foal by her side, Ardmersay May Queen and her foal by Filgion Royal John.

Coach Horses—The only representatives of the coach horse breed was the aged stallion Danois and an aged mare shown by H. C. Jewett.

Clydesdales—Were out in large numbers and there was quality to burn. Five aged stallions, Baron's Own, Baron Squire, Boreland Crest, Black Band, Sensation and Lascar, faced the judge. Awards were in the order named. When the champion class was called the diploma went to the yearling stallion Kelvin's Pride, by Baron Kelvin. Kelvin's Pride was bred by Mr. E. Heartz, of Marshfield, P.E.I., and purchased in 1914, by R. A. Snowball, Chatham, N.B.

Ten mares came forward in the aged class. R. A. Snowball's Rose of Litterte and Miss May in first and third places, sandwiched McFarlane Bros.' Bess Spencer, while further down the line were McFarlane Bros.' Balmangan Belle, Wm. Clark's Silver Lock and Silver Blossom, Geo. Dowe's Meadow Lawn, Ida and Nellie Dow and Clover Nook Stock Farm's Bonnie Bell. Among the prize winning foals in the Clydesdale class as well as in the general purpose and heavy draught classes were a strong representation of the get of H. C. Jewett's Clydesdale stallion Day Dream. Baron Squire was first with three of his get.

Percherons—The only representative of the Percheron breed were the stallions, Gresham, Avocation, Indican and Meinier which were placed in the order named and two two-year-old stallions shown by F. J. Sullivan, Fredericton.

Suffolk Punch Horses—Were represented by the aged stallions, Almo and Abner of Mt. Hermon, owned by P. K. Stuart of Carleton county and Shaw Bros. of Andover respectively.

The Beef Cattle

There was a good showing of beef cattle. Although competition was not very keen in some of the classes, the various herds were out in a very creditable condition. R. A. Snowball's herd captured the lion's share of the red ribbons in the Shorthorn class. Fred Cromwell, Cookshire, Que.; McCullough Bros., Mouth of Keswick, N. B.; John R. Jewett, Macniquae, N.B., and H. Baldwin, Chatham, N.B., were the other exhibitors of Shorthorns.

Wm. O'Brien and Jas. O'Brien of Windsor Forks, had everything their own way in the Hereford class. The white faces showed to good advantage. Wm. Pinkney, of Melborne, N.S. met no competition in the Devon class. The battle royal in the Aberdeen Angus class was between J. M. Laird & Son, and A. G. Spafford. The majority of the red ribbons went to the Laird herd.

A. J. Howden, Columbus, Ont., placed the awards.

DAIRY CATTLE

The showing in the dairy cattle class was creditable to the respective exhibitors, but the exhibitors were not numerous enough. McIntyre Bros. met with no competition in the Ayrshire class with the exception of a few individuals exhibited by Clover Nook Stock Farm. Harding Bros. had pretty nearly a clean sweep with their Holsteins. Hooper Bros., and John Hooper, Compton, Que., showed some nice Canadian cattle. H. W. Corning, Chegoggin, N.S., H. A. Dickson, Truro, and R. R. Black, Amherst, N. S., showed their well kept Guernseys. The fight was on between the Corning and Dickson herds. The reader of the prize winnings will see that they were pretty evenly matched, regular tit for tat from start to finish.

The Jersey class with Messrs. H. S. Pipes & Son, Edwards & Alexander and Cann Bros. in the ring, there was something doing every minute. The various herds were out to win.

See the list of awards in the respective dairy classes, on another page. F. L. Greene, Greenwood, Ont., and Abel F. Stevens, Wellesley, Mass., were the judges.

SHEEP

The sheep classes were small, but well fitted. Competition was not very keen. Clover Nook Stock Farm, W. Craig, Ray Burpee, Z. R. Estey and B. Goodspeed were the only New Brunswick sheep men that showed this year that there are still some sheep in the province. The Nova Scotia and Prince Edward Island breeders divided their flocks and sent some to Fredericton and the remainder to Charlottetown. Mr. John Miller, Claremont, Ont., placed the awards.

SWINE

With the exception of the Berkshire and White Chester classes, in which there was a fair amount of competition, the breeders in the other swine classes had everything their own way. Clover Nook Stock Farm swept the board without competition in Tamworths. J. E. Baker & Sons had a similar walk-over with their Duroc-Jerseys, and A. C. Servant met a similar fate with his Poland Chinas. A. C. Servant and Shaw Bros. were the competitors in Berkshire class and John R. Jewett,, B. Goodspeed, Roy Kitchen, H. W. Corning and W. H. Moore showed their Chester White's to good advantage. A. C. Hallam, Breslau, Ont., placed the ribbons.

POULTRY

Mr. Seth Jones, poultry superintendent for New Brunswick, judged the poultry classes, the showing in which was not up to the average of other years. See a list of awards elsewhere in this issue.

Moore showed their Chester White's to good advantage. A. C. Hallam, Breslau, Ont., placed the ribbons.

POULTRY

Mr. Seth Jones, poultry superintendent for New Brunswick, judged the poultry classes, the showing in which was not up to the average of other years. See a list of awards elsewhere in this issue.

383127

The Charlottetown Exhibition

The Prince Edward Island Provincial Exhibition was held in Charlottetown on September 21 to 24 inclusive. The attendance, owing largely to the lateness of the season and the fact that practically all the farmers were too busy with their harvest to attend to anything else, even an exhibition, was not as large as that of 1914. The weather also was somewhat to blame, the equinoxial gales were very disagreeable.

As an exhibition of what Prince Edward Island can produce in the way of live stock, field and garden crops, art work, etc., it was a splendid success. As already stated, the busy harvesting season occurring so late in September, helped very materially to keep the exhibits of fruit and vegetables at a lower ebb than would have been the case were the farmers through with their harvesting work.

There was a good showing of heavy horses. Mr. Greenlees, of Bowmanville, Ont., who judged this class, expressed surprise on finding such excellent quality in the ring. He said the Prince Edward Island horses compared very favorably with those seen at Toronto and other central Canadian fairs.

W. J. Stark, of Edmonton, Alta., placed the awards in the light horse classes. He was particularly pleased with the 1915 crop of foals. He said they were the best he had seen in any show ring in Canada.

The Dairy Cattle were judged by P. D. McArthur, of Howick, Que., and R. S. Stevenson, of Ancaster, Ont. Mr. Grant of Brockton, Ont., placed the awards in the Beef Cattle classes. Col. McEwen, London, Ont., judged the sheep, and W. Jones, Zenda, Ont., dispensed justice in the Swine classes.

Competition was quite keen in the respective Dairy classes. The veteran exhibitors were out in full force and there was a fair number of new comers. Despite the fact that a large number of the best Prince Edward Island sheep were at the Fredericton exhibition the breeders who patronized the home fair made a good showing.

The Swine sheds were well filled with some of the Island's best. See the list of awards for "Who is Who?" in the Prince Edward Island Swine breeding industry.

One of the big features of the Charlottetown exhibition was the display of cheese. The plan was to have a June, July, August and September cheese from each and every cheese factory in the province. The plan was worked out by Mr. Harry Mitchell, Dairy Superintendent, and the response was quite satisfactory. Geo. H. Barr, Ottawa, placed the awards as follows:

Name of Factory.	Score	Rank.
Lot 16	95.80	1
Gowan Brae	95.57	2
Red Point	95.52	3
Orwell	95.1	4
New Perth	95.1	4
Hazelbrook	95.02	6
Kensington	94.87	7
Dundas	94.62	8
Red House	94.5	9
Hillsboro	94.47	10
Tyne Valley	94.45	11
Vernon River	94.35	12
Stanley Bridge	94.35	12
Park Corner	94.2	14
Tignish	94.2	14
Egmont Bay	94.02	16
Kinkora	93.9	17
Hamilton	93.62	18
Grand River	93.57	19
Emerald	93.57	20
Alberton	93.35	21
Summerside	92.92	22
Wiltshire	92.85	23
Cornwall	92.82	24

Souris East, O'Leary, New Glasgow, Mount Stewart, Murray Harbor and Lakeside did not show any cheese.

The scores given above are the averages obtained by dividing the aggregate score of the four cheeses from each factory by four. The cheese display was the biggest feature of its kind ever staged at a Maritime Province exhibition.

PRIZE WINNERS AT CHARLOTTETOWN EXHIBITION

HORSES

Carriage

Mare with foal at foot.—1, A. H. Boswell, Little York; 2, Almon Boswell, French Fort; 3, George R. Montgomery, City.

Carriage mare of gelding, 15½ hands over to be shown in carriage.—1, Mrs. A. M. Gaudet, Tignish; 2, Geo. L. Boswell, French Fort; 3, Prowse Bros., City.

Carriage mare or gelding under 15½ hands to be shown in carriage.—1, John Livingston, New Dominion; 2, A. E. McBeth, Marshfield; 3, J. P. Hooper, City.

Champion mare, any age. (To compete in this section, mare must have been shown in some section in this class—1, John Livingstone, New Dominion.

Pair of horses, geldings or mares, or one of each to be shown to a carriage, Horse to count 60 per cent., Appointment 40 per cent. Horses to have good conformation, quality and manners. Horses to be property of exhibitor who must be owner at time of making the entries.—2, John McPhee, Freetown.

CLASS 3—Standard Bred Horses

Stallion, 4 years old and upwards.—1, Hammond Kelly, City; 2, John Richard, Bideford; 3, J. H. G. Murphy.

Stallion, 2 years old.—1, D. W. White, York Point.

Filly, 2 years old—1, Thos. C. Lathen, Sylvester, Pictou Co., N.S.; 2, J. Stanley Wedlock, City; 3, Dr. Leckie, City.

For best 2 year old stallion Diploma —1, D. W. White, York Point.

Mr. Hammond Kelly, of Southport, P.E.I., offers the following special prizes:

For foal of 1915 sired by Standard Bred Stallion Mayor Todd.

1, Wm. Lane, Southport; 2, G. H. Jones, Harrington; 3, W. F. Burke, Royalty; 4, Neil McKenzie, Canoe Cove.

Mr. J. H. G. Murphy of Charlottetown, P. E. I., offers the following special prizes:

For Foal of 1915, sired by Standard Bred Stallion, Prince Marjor.—1, Alex. R. McKay, City.

CLASS 4—Saddle Horses

Gentleman's Saddle Horse, Gelding or Mare, not less than 15½ hands and must be shown under saddle and ridden by a gentleman,—1, Charles McDonald, Summerside; 2, Hammond Kelly, City; 3, J. Heber Crosby, Marshfield.

Ladies' Saddle horse, gelding or mare, not less than 14 hands, must be shown under saddle and ridden by a lady.—1, Stephen Holroyd, Winsloe; 2, Miss Ethel Haszard, City; 3, Reagh Horne, Winsloe.

Special Prize given by Hon. John Richards of Bideford for foal of 1915, sired by the Standard Bred Stallion "Captain Aubrey."—1, H. H. Boswell, Little York; 2, F. L. Haszard, City; 3, Arthur McEachern, City.

CLASS 5—Hackney Horses

Stallion, 3 years old and upward.—1, George L. Boswell, French Fort.

CLASS 6—Roadsters

Mare or Gelding, 4 years old and upwards—1, George Stewart, Keppock;; 2, Robert McCallum, Dunstaffnage; 3, J. Stanley Wedlock, City.

Filly or Gelding, 3 years old.—1, H. D. Jenkins, West Royalty; 2, D. H. White, York Point; 3, Harold Newsom, East Royalty.

Brood mare with foal of same breed by her side.—1, Byrne Bros., North River; 2, W. E. Agnew, City; 3, Alex. R. McKay, City.

Mare or gelding to be shown in carriage.—1, H. G. Reddin, City; 2, Leith Boswell, Victoria; 3, Mary Tidmarsh, City.

CLYDESDALES

CLASS 7.—Clydesdales Registered.

Stallion, 4 years old and upwards—1, John Richards, Bideford; 2, David Reid, Montague; 3, K. B. McKinley, North River.

Stallion, 3 years old.—1, Roper Bros., Royalty; 2, H. B. Frizzle, Cornwall.

Stallion, 2 years old.—1, D. C. McKinley, York Point; 2, William Godfrey, Marshfield; 3, Edward Currie, Fairview.

Stallion, 1 year old.—1, J. Heber Crosby, Marshfield; 2, Boyd Livingstone, Clyde River; 3, Cass Bros., North River.

Filly, 3 years old.—1, John Lea, Victoria; 2, Wm. Godfrey; 3, John Richards, Bideford.

Filly, 2 years old—1, Paterson Walker, Freetown; 2, Edgar Heartz, Marshfield; 3, J. Heber Crosby.

Filly, 1 year old—1, W. W. Crosby, Cornwall; 2, J. Heber Crosby; 3, Edgar Heartz.

Foal of 1915.—1, A. H. Boswell, Little York; 2, Edgar Heartz; 3, Wm. Lane, Southport.

Mare with foal at foot—1, Edgar Heartz; 2, J. Heber Crosby; 3, Wm. Lane.

Champion Stallion, any age.—1, John Richards (Diploma.)

Champion mare, any age.—1, John Richards, (Diploma).

Stallion and 3 of his get—Get not to exceed 3years old.—1, John Richards (Diploma.)

SPECIAL PRIZES GIVEN BY THE CLYDESDALE HORSE ASSOCIATION OF CANADA

For the best Clydesdale Stallion any age.—1, John Richards, Bideford; 2, Wm. Godfrey, Marshfield; 3, David Reed, Montague.

For the best Clydesdale Mare any age.—1, Jabez Lea, Victoria; 2, Paterson Walker, Freetown; 3, J. Heber Crosby, Marshfield.

For the best Island bred Cldyesdale mare—1, W. W. Crosby, Cornwall; 2, Jabez Lea, Victoria; 3, J. Heber Crosby.

For the best single mare or gelding in harness, sired by a registered Clydesdale stallion—1, Edgar Heartz; 2, D. C. McKinley; 3, Mrs. Daniel F. Fraser, North River.

Best foal of 1914, sired by a pure bred Clydesdale stallion, registered as above from a grade mare of any breed—1, Perley Mutch, Southport; 2, J. Walter Jones, City; 3, Charles Bryenton, Winsloe.

1, Walter Jones; 2, Charles Bryenton.

Special Prizes Given by Hon. John Richards

For foals of 1915, sired by the Clydesdale stallion Baron Kelvin.—1, A. H. Boswell, Little York; 2, Perley Mutch, Southport; 3, Wm. Lane, Southport.

CLASS 9—Percherons

Stallion, 4 years old and upwards.—1, David Reid, Montague; 2, Alex. R. McKay, City.

Filly, 3, years old.—1, Alex. R. McKay.

Filly, 2 years old—1, Alex R. McKay.

Filly, 1 year old.—1, Alex. R. McKay.

Foal of 1915.—1, Alex. R. McKay.

Mare with foal at foot—1, Alex. R. McKay.

Champion stallion, any age.—1, David Reid (Diploma.)

Champion mare, any age—1, Alex. R. McKay (Diploma).

CLASS 10.—Draft Horses

Filly, 3 years old.—1, D. C. McKinlay, North River, (York Point); 2, Benjamin Rodd, Prackley Point Road; 3, J. Heber Crosby, Marshfield.

Filly, 2 years old—1, Perley Mutch; 2, Oliver Munn, Winsloe.

Filly, 1 year old.—1, Wm. Crosby, Cornwall; 2, H. C. Robertson, Marshfield; 3, D. C. McKinley, York Point.

Foal of 1915.—1, Perley Mutch; 2, John H. Pierce, Winsloe Station; 3, J. Walter Jones, City.

Mare with foal at foot—1, Bert Trowsdale, Hampton; 2, Charles Bryenton, Winsloe; 3, Mrs. Henry Jones, Hazelbrook.

Pair of Draft Horses, not less than 1400 lbs. each, both to be owned by one person for at least 30 days before the exhibition, and to be shown in harness to a truck wagon (pair may be 2 geldings or 2 mares or mare and gelding).—1, D. C. McKinley, York Point; 2, Benj. Road, Brackley Point Road; 3, Donald McMillan, City.

Draft mare or gelding, not less than 1400 lbs. (not one pair shown in Section 6.)—1, George Simmons, West Royalty; 2, Fred Turner, Winsloe Road; 3, Alex. R. McKay, City.

CLASS 1—Special Prizes Given by the Charlottetown Steam Navigation Company

To the 4 best draft colts, under 3 years old and get of any one registered draft stallion (may be colts or fillies or both), entry to be made in the name of the owner of the sire. $20—1, W. W. Crosby, Cornwall.

Given by the Hon John Richards of Bideford, for foal of 1915 sired by the Standard bred stallion "Captain Aubrey" $16, $12.—1, Lon Pigot, City; 2, Maurice Blake, City; 3, R. W. Younker, Winsloe.

CLASS 12.—General Purpose Horse.

Mare or Gelding, 4 years old and upwards—1, Goodwill McPhail, Argyle Shore; 2, Maurice Blake, City; 3, R. W. Yonker, Winsloe.

Mare or gelding, 3 years old.—1, Maurice Blake, City; 2, Vernon McMillan, City.

Brood mare with foal at foot.—1, W. F. Burke, Charlottetown Royalty.

Matched team, geldings or mares, or a mare and a gelding, shown in harness, not to exceed 1300 pounds each.—1, W. F. Burke, Charlottetown Royalty.

CLASS 13.—Walking Horses

Mare or gelding, to be shown in carriage.—1, Byrne Bros., North River; 2, George Stewart, Keppoch; 3, Hugh McKinnon, Charlottetown Royalty.

CLASS 15.—Pair of Ponies

Single pony, 12 hands and under, in harness.—1, Clifford Chandler, City; 2, Patrick Keenan, City; 3, Alex. R. McKay, City.

CATTLE

CLASS 16—Shorthorns

Bull, 3 years old and upwards.—1, Mrs. Alex. D. McLean, Rice Point; 2, J. A. Stewart, Southport.

Bull, 2 years old—1, J. M. Leard & Son, Kelvin Grove; 2, Francis Chowan, Winsloe Station; 3, J. W. Callbeck & Sons, Summerside.

Bull, 1 year old—1, Albert S. Boswell, Pownall; 2, Cass Bros., North River.

Bull calf, under one year and over 6 months—1, J. M. Leard & Son.

Bull calf, under 6 months and over 3 months—1, Cass Bros.; 2, Albert S. Boswell.

Cow, in milk or calf, 3 years old and upwards—1, J. W. Callbeck & Sons; 2, J. M. Leard & Son; 3, J. M. Leard & Son.

(Continued on Page 14)

The Sydney Exhibition

The fourth annual Cape Breton Island exhibition was held in Sydney on the 21st to the 24th of September. The dates clashed with Charlottetown and Fredericton, and Cape Bretonites who wished to visit either of the latter cities were obliged to be absent from home during the Sydney fair dates. This and the large number of men and boys who have left Cape Breton homes to serve their king and country tended to reduce the aggregate attendance.

The quality of the exhibits in the various departments of the fair was well up to the high average of other years, but the quantity was considerably reduced compared with the fair of 1914.

Following is a list of the prize winners:

HORSES

Draught Horses

Stallion, any pure breed, over 3 years—1, H. A. Moffatt, Groves' Point, N. S.

Mare or gelding, any breed, or grade over 4 years—1, R. M. MacLeod & Son, Glen Farm, Groves Point; 2, M. W. J. MacKenzie, Coxheath; 3, Murdo McKenzie.

Mare or gelding, any breed or grade, 3 years old—1 and 2, D. R. Nicholson, Coxheath.

Mare or gelding ,any breed or grade, 2 years old—1, Fred. J. McLeod, Sydney Mines.

Mare or gelding, any breed or grade, 1 year old—1, Chas. Andrews, Coxheath; 2 and 3, D. R. Nicholson.

Mare or gelding, any breed or grade, under 1 year—1, H. P. MacKenzie, Blackett's Lake.

Brood mare with foal by side—1, H. P. MacKenzie.

Best mare or gelding, any age—Diploma, R. M. MacLeod & Sons.

Best stallion, any breed, any age—Diploma, H. A. Moffatt.

Stallion and three of his get.—Diploma, H. A. Moffatt.

General Purpose Horses

Mare or gelding. 4 years old or over—1 and 2, Andrew McLellan, Glenville, N.S.; 3, A. J. McLeod, South Bar.

Mare or gelding, 3 years old—1, R. M. Jackson, Jacksonville; 2, M. W. J. MacKenzie; 3, Murdo MacKenzie.

Mare or gelding, 2 years old—1, J. Webster Allen, North Sydney; 2, C. A. Munn & Son, Leitches' Creek; 3, Andrew McLellan.

Mare or gelding, 1 year old—1, Norman Johnson, Leitche's Creek.

Mare or gelding, under 1 year—1, S. D. Gillis & Son, East Bay; 2, R. M. Jackson; 3, Murdo MacKenzie.

Brood mare with foal by side—1, S. D. Gillis & Son; 2, R. M. Jackson; 3, Murdo McKenzie.

Matched pair, shown in harness, open to farmers only—1, S. D. Gillis & Son.

Brood mare and two of her progeny—Diploma, S. D. Gillis & Son.

Best mare or gelding, any age—Diploma, Andrew McLellan.

Carriage Horses

Stallion, pure bred, 3 years or over—1, S. D. Gillis & Son.

Mare or gelding, any breed or grade over 4 years—1, John McQueen, Leitches Creek; 2, Fraser McKenzie, Reserve Mines; 3, Arthur J. McDonald, Sydney.

Mare or gelding, any breed or grade 2 years old—1, Geo. Oland, Coxheath.

Mare or gelding, any breed or grade 1 year old—1, J. G. McDonald, Sydney; 2, Geo. Oland.

Mare or gelding, any breed or grade under 1 year—Joseph Rose, Sydney; 2, Geo. Oland.

Brood mare with foal by side—1, Geo. Oland; 2, Joseph Rose.

Matched pair, shown in harness—1, Geo. Oland.

Brood mare and two of her progeny—1, Geo. Oland.

Roadster Horses

Stallion, pure bred, 3 years or over.—1, Chas. Thompson, North Sydney.

Mare or gelding, any breed or grade 4 years old—1, M. D. McPhee, Sydney; 2, J. Webster, Allen; 3, H. C. Musgrave, North Sydney.

Mare or gelding, any breed or grade 3 years old—1, R. M. MacLeod & Son; 2, Wm. Hines, Reserve Mines.

Mare or gelding, any breed or grade under 1 year—1, Parker M. Rice, George's River; 2, A. N. Morrison, Sydney Mines.

Brood mare with foal by side—1, Parker M. Rice; 2, A. N. Morrison.

Best mare or gelding, any age—Diploma, M. D. McPhee.

Ponies, 12½ Hands and Under.

Pony, any age—1, M. Matheson, Whitney Pier; 2, William C. Nicholson, Coxheath; 3, Michael Sullivan, Sydney.

CATTLE

Grade Beef Catttle

Fat steer or cow, 3 years old—1 and 3, D. R. Nicholson; 2, R. M. Jackson.

Fat steer or heifer, over 1 year.—1 and 2, Jas. Marnell, Luigan Road.

DAIRY CATTLE

Holsteins

Bull, 1 year old—1, D. R. Nicholson; 2, H. C. Musgrave.

Bull, senior calf—1, D. R. Nicholson.

Bull, junior calf—1, A. K. Jackson, Jacksonville.

Cow in milk, 4 years or over—1, and 2, D. R. Nicholson.

Dry cow, 4 years old—1 and 2, D. R. Nicholson.

Cow, 3 years old—1, D. R. Nicholson.

Dry cow, 3 years old.—1, D. R. Nicholson; 2, Jas. Kennedy, Glace Bay.

Cow, 2 years old—1, A. K. Jackson.

Heifer, 2 years old—1, D. R. Nicholson.

Heifer, 1 year old—1, D. R. Nicholson; 2, A. K. Jackson.

Heifer, senior calf—1, D. R. Nicholson

Heifer, junior calf—1 and 2, D. R. Nicholson.

Best bull, any age—Diploma, D. R. Nicholson.

Cow and two of her progeny—Diploma—D. R. Nicholson.

Herd—1, D. R. Nicholson.

Breeders' young herd—1, D. R. Nicholson.

Champion cow—1, D. R. Nicholson.

Ayrshires

Bull, 3 years and over—1, G. B. Macdonald, Sydney; 2, A. R. Richardson, South Bar; 3, M. W. Ross & Son, Sydney Mines.

Bull, 2 years old—1, M. W. Ross & Son.

Bull, 1 year old—1, Neil McKinnon, Up. Kempt Head; 2, John R. Redmond; 3, J. W. McGuire, Sydney.

Bull, junior calf—1 and 2, M. W. Ross & Son.

Cow in milk, 4 years or over—1, M. W. Ross & Son; 2, John R. Redmond; 3, John B. Musgrave, North Sydney.

Dry cow, 4 years old—1 and 2, Alex. Boutilier, Sydney Forks; 3, M. W. Ross & Sons.

Cow, 3 years old—1, John R. Redmond; 2, R. M. Jackson.

Dry cow, 3 years old—1, N. J. McNeil, Sydney Forks.

Cow, 2 years old—1, M. W. Ross & Son; 2, John R. Redmond.

Heifer, 1 year old—1, M. W. Ross & Son; 2, Alex. Boutilier; 3, Colin Collier, "Burnside," Coxheath.

Heifer, senior calf—1, Alex. Boutilier; 2, M. W. Ross & Son.

Heifer, junior calf—1, John R. Redmond; 2 and 3, M. W. Ross & Son.

Best bull, any age,—Diploma, G. B. McDonald.

Bull and three of his get—Diploma M. W. Ross & Son.

Cow and two of her progeny—Diploma, M. W. Ross & Son.

Herd—1, M. W. Ross & Son; 2, John R. Redmond; 3, Alex. Boutilier.

Breeders' young herd—1, M. W. Ross & Son.

Champion cow—1, M. W. Ross & Son.

JERSEYS

Bull, 3 years old—1, H. A. Moffatt & Son.

Bull, 1 year old—1, J. Webster Allen; 2, Norman Johnston; 3, H. P. MacKenzie.

Bull, junior calf—1, H. A. Moffatt & Son; 2, Donald Johnston, Leitch's Creek.

Cow in milk, 4 years old—1, John McQueen; 2, Donald Johnston; 3, J. Webster Allen.

Dry cow, 4 years old—1, J. Webster Allen; 2, H. A. Moffatt & Son; 3, H. P. MacKenzie.

Cow, 3 years old—1 and 2, H. A. Moffatt & Son.

Cow, 2 years old—1, M. W. Ross & Son.

Heifer, 2 years old—1, H. A. Moffatt & Son; 2 and 3, J. Webster Allen.

Heifer, 1 year old—1, H. A. Moffatt & Son; 2. Donald Johnston.

Heifer, senior calf—1, Donald Johnston; 2, John MacQueen; 3, J. Webster Allen.

Heifer, junior calf—1, 2 and 3, H. A. Moffatt & Son.

Best bull, any age—Diploma, H. A. Moffatt & Son.

Bull and 3 of his get—Diploma, H. A. Moffatt & Son.

Herd—1, H. A. Moffatt & Son; 2, Donald Johnston.

Breeders' young herd—1, J. Webster Allen; 2, H. A. Moffatt & Son.

Guernseys

Bull, 3 years old—R. M. Jackson.

Bull, 2 years old—1, Murdo McKenzie; 2, W. W. Johnston.

Bull, 1 year old—1, E. J. Johnston, George's River.

Bull, junior calf—1, R. M. Jackson.

Cow, 4 years old and over—1, Murdo MacKenzie; 2, R. M. Jackson.

Dry cow, 4 years old—1, Murdo MacKenzie.

Cow, 3 years old—1, Murdo MacKenzie.

Cow, 2 years old—1, Murdo MacKenzie.

Heifer, 2 years old—1, R. M. Jackson.

Heifer, 1 year old—1, R. M. Jackson.

Heifer, senior calf.—1 and 2, R. M. Jackson.

Heifer, junior calf—1 and 2, R. M. Jackson.

Best bull, any age—Diploma, Murdo MacKenzie.

Herd.—1, Murdo MacKenzie.

Breeders' young herd—1, R. M. Jackson.

Champion female—Murdo MacKenzie.

Grade Jerseys

Cow, 4 years old—1, D. R. Nicholson; 2, J. B. Musgrove; 3, A. R. Richardson.

Dry cow, 4 years old—1, Murdo McKenzie; 2, M. W. J. McKenzie; 3, J. Webster Allen.

Cow, 3 years old—1, H. P. MacKenzie; 2, Geo. Oland.

Dry cow, 3 years old—1, A. N. Morrison; 2, H. P. MacKenzie.

Cow, 2 years old—1, C. A. Munn & Son; 2, A. N. Morrison; 3, H. C. Musgrove.

Heifer, 2 years old—1, H. A. Moffatt & Son; 2, Donald Johnston; 3, Geo. Oland.

Heifer, senior yearling—1, H. A. Moffatt & Son.

Heifer, junior yearling—1, J. W. Webster Allen; 2, H. A. Moffatt & Son; 3, Nelson Beaton, Coxheath.

Heifer, senior calf—1, H. A. Moffatt & Son.

Heifer, junior calf—1, Jas. Marnell.

Grade Guernseys

Cow, 4 years old—1, E. J. Johnston; 2, John McQueen; 3, A. K. Jackson.

Dry cow—4 years old—1, John McQueen; 2, John R. Redmond; 3, M. W. J. MacKenzie.

Dry cow, 3 years old.—1, M. W. J. MacKenzie.

Cow, 2 years old—1, Murdo McKenzie; 2, H. P. McKenzie; 3, Colin Collier.

Heifer, 2 years old—1, Murdo McKenzie; 2, Geo. Oland.

Heifer, senior yearling—1, Murdo McKenzie; 2, M. W. J. MacKenzie.

Heifer, junior yearling—1, H. C. Musgrove; 2, Collin Collier; 3, John McMullin.

Heifer, senior calf—1, Wilson Gillis, Georges' River; 2, Murdo McKenzie; 3, H. P. MacKenzie.

Heifer, junior calf—1, D. R. Nicholson; 2, Murdo McKenzie.

Grade Ayrshire

Cow, 4 years and over—1, A. R. Richardson: 2, N. J. McNeil; 3, J. Webster Allen.

Dry Cow, 4 years old—1, R. M. Jackson; 2 and 3, N. J. McNeil.

Cow, 3 years old—1, A. R. Richardson.

Cow, 2 years old—1, H. C. Musgrove; 2, N. J. McNeil.

Heifer, 2 years old—1, Geo. Oland.

Heifer, senior yearling—1, Nelson Beaton; 2, Wilson Gillis; 3, Jas. Marnell.

Heifer, junior yearling—1, Alex. Boutilier; 2, A. R. Richardson.

Heifer, senior calf—1, A. R. Richardson; 2, N. J. McNeil.

Heifer, junior calf—1 and 2, John McMullin; 3, N. J. McNeil.

Grade Holsteins

Cow, 4 years and over—1, J. W. McGuire, Sydney; 2, John McQueen; 3, C. A. Munn & Son.

Dry cow, 4 years old—1 and 3, D. R. Nicholson; 2, C. A. Munn & Son.

Cow, 3 years old—1, Murdo McKenzie; 2, C. A. Munn & Son; 3, A. K. Jackson.

Dry cow, 3 years old—1, Geo. Clare, Sydney; 2, Murdo McKenzie; 3, A. K. Jackson.

Cow, 2 years old—1 and 2, D. R. Nicholson.

Heifer, 2 years old—1, John McQueen; 2, D. R. Nicholson; 3, C. A. Munn & Son.

Heifer, senior yearling—1 and 2, John McQueen; 3, D. R. Nicholson.

Heifer, junior yearling.—1, J. B. Musgrove; 2, John McQueen; 3, A. K. Jackson.

Heifer, senior calf—1, A. K. Jackson.

Heifer, junior calf—1, John McQueen; 2, C. A. Munn & Son; 3, A. B. McPhee, Leitches' Creek.

Grade Herds

Grades, best herd, 5 cows, 3 of which must be over 2 years—1, John McQueen; 2, D. R. Nicholson; 3, C. A. Munn & Son.

Grades, best herd, 4 heifers under 3 years.—1, John McQueen; 2, Murdo McKenzie; 3, C. A. Munn & Son.

Best cow, any age or breed—Diploma, D. R. Nicholson.

Best grade cow, any age—Diploma, J. W. McGuire.

Best Bull, any age or breed (dairy)—Diploma, G. B. McDonald.

Best pure bred herd—D. R. Nicholson.

SHEEP

Leicesters

Ram, 2 years old—1, Nelson Beaton.

Ram, 1 year old.—1, Mrs. R. Morrison, Cape North.

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or

November 9-23
December 7-21

THE PESTIFEROUS SCRUB.

Unfortunately there are in every community some farmers who are absolutely indifferent to the rights of their neighbors and who are a constant drawback to the general development of the district as a whole. Every year complaints are made concerning the damage which scrub bulls do when allowed to run loose over the countryside. Many of these strays are yearlings that some shiftless man is too negligent to castrate, while some farmers are so short-sighted as to keep scrub bulls for the purpose of breeding from them. There is absolutely no license for scrub bulls being allowed to run loose. They are a menace to the production of pure-bred stock and act detrimentally to the whole district in that buyers do not come where scrub bulls are allowed to run loose. D. B. Howell, of Langenburg, a prominent and progressive dairyman, says concerning this question, that "scrub bulls are a menace to growing heifers. Yearling heifers come in season as good pasture comes, are bred on the commons and then calve early the next spring when the heifer is in her very lowest condition of flesh and thrift. As a result calf and heifer do not do well. To raise the calf with such a start stunts the heifer and detracts $25 from her value as breeding stock. This amount I consider low in grade stock, but to have a little yearling of pure breeding gett in calf from such a bull entails a loss of $100 at least."

"The remedy for this situation lies with the municipal councils. They pass bylaws governing strays and prescribe penalties. Then, again, this nuisance could be largely done away with if men had enough backbone to run such scrubs into the pound. The reason it isn't done is that a man is afraid of making an enemy of a neighbor. I consider the man no friend of mine who permits a scrub to run at large and damage my stock."

The question of offending neighbors should never enter into consideration in this matter. Scrub bulls should not be used by farmers on their own stock. Either the provincial department of agriculture of the Dominion department if written to will make it possible for a pure-bred bull to be placed for service in any district, and farmers are not taking full advantage of the opportunity afforded them if they do not make use of this offer.

Try to use pure-bred bulls yourself and pound every scrub bull thta is allowed by a shiftless neighbor to run loose.

SOIL FERTILITY AND LATE CROPS

A writer in the Breeders' Gazette says:

"Any young animal inadequately nourished before it is weaned or thereafter will require a longer period than a well-fed youngster of the same age and breeding in which to mature. The attainment of full growth is retarded and delayed by an insufficient food supply in the case of plants as well as animals. Crops grow more rapidly and hence mature in a shorter time on fertile land than on impoverished soils. Late planting or sowing often causes plants in thi nsoils to race with the season, and they more often lose than win, Late-planted corn is now in a desperate chase, in some parts of the country, with Jack Frost hard upon its heel. Planted at the same time in a highly productive soil, the same corn in the great majority of cases would now be so near the goal that the pursuer could not overtake it. The enemy's pursuit would end in failure; the pursued would win.

"Large areas are planted to corn comparatively late every year. On account of rains theacreage last spring planted four to six weeks late was extraordinarily large. Thousands of fields are still well out in the danger zone; it will take them several weeks to mature. Meantime, Jack Frost is nipping green things in some of the northern regions, and nobody knows when he may invade the cornbelt. If the next few weeks are not favorable to the maturing of late corn, he will probably chase vast armies of immature standing stalks into silos which constitute the last line of defence.

"Practical experience and investigations at many of the experiment stations prove conclusive ly that, to quote J. G. Hutton of the North Dakota station, "crops mature earlier on a soil that is well supplied with plantfood than on a soil which contains an insufficiency of one or more of the elements of plantfood." A week or even a few days of induced or extra earliness, in a season like the present, might mean hundreds of dollars saved. View it from any practical point of view, a highly fertile soil pays regularly and dependably, whether the season be wet, dry, long or short. The possession of such a soil is nine points in the ten by which we measure agricultural returns in the court of experience."

MAKING PROGRESS.

Walking is a process of taking a chance of falling and then catching yourself before you do it. The speed at which one goes forward, or progresses, depends on the frequency with which he takes chances; the distance to which he walks, depends on the number of such chances he takes—and on his ability to keep from falling each time he takes a chance. If he does not take the chance at all, he stands still.

It is a good deal the same way about advancing or making progress in anything else. No one is able to make any advancement whatever in anything if he does not take a chance of failing at it; for any undertaking has in its an element of chance, or the possibility of failure. If one does not take a chance of falling, he does not succeed in walking; if he does not take the chance of failure involved in an undertaking, he never accomplishes any part of it.

The man who never tries—who never takes a chance—never accomplishes anything more than merely existing. A man who never takes a chance is a coward rather than a wise man, and who wants to be a coward? To make a parody of an old familiar saying: "It is better to have tried and failed than never to have tried at all."

So do not be afraid if you have been thinking of trying something different this year. It is a moral certainty that you will never succeed if you do not try, and there is a chance that you may succeed if you try real carefully and provide against every known possibility of failure. So take the chance and very probably success will attend your efforts; at least there is no failure more disgraceful than the one of not even making the attempt.

AGRICULTURE ALWAYS BACK OF SUCCESS.

Back of all success lies the agricultural instinct of this great Dominion. The Vanderbilts 100 years ago seized the opportunities that were offered by railroading. It was electricity that forty years ago caused Edison to seize an opportunity. Every bit of land that can be cultivated is begging for boys to embrace the opportunity of soil production. The farmer is as much of a business man as the man who runs a store in town. Farming is one of the most needed and useful professions in the world. It takes as much brains, energy and thought to get results from the soil as it does to conduct any business—bank or store, mill or factory. On the farm lies the greatest possibilities of any profession in the world. What Edison did for electricity is needed by the world today as it never was before. There is no long waiting line of applicants seeking the opportunity offered by the soil. Every tillable acre is extending a beckoning hand to the sons and daughters of farmers—a higher standard of efficiency in agriculture should be aroused. Good roads, better rural schools, modern farm buildings are making the city resident envious of his rural neighbor. Back of all success lies the agricultural instinct of this great Dominion.

EDITORIAL NOTE

One of the interesting features staged in connection with the Poultry Department of the Halifax Exhibition was a modern two pen poultry house fully equipped. There was a flock of pure-bred birds in each pen. The house and yards were of the kind that Prof. Landry recommends the farmers of Nova Scotia to build. Ampleprovision was made for light, ventilation, sanitation, feeding, watering, and keeping records of the best layers. A farm flock kept under the ideal conditions outlined by Prof. Landry will be sure to add very materially to the farm revenues.

Prize Winners at Fredericton Exhibition

SHEEP

Cotswolds

Two shear ram—1, George Rettson, Truro.
Shearling ram.—1st, Chas. Symes, Minudie; 2nd, W. Craig, Nashwaaksis.

Two shear ram—1, C. D. Pugsley, River Hebert, N.S.: 2, Albert Boswall, P.E.I.
Shearling ram—1, Albert Boswall.
Ram lamb—1, C. Pugsley.
Two shear ewe—1, 2 and 3, C. Pugsley.
Yearling ewe—1, C. Pugsley; 2, A. Boswall.
Ewe lamb—1 and 2, C. Pugsley; 3, A. Boswall.
Pen of sheep—1, C. Pugsley; 2, A. Boswall; 3, C. Pugsley.
Pen of lambs—1, C. Pugsley; 2, A. Boswall.

Oxford Downs

Two shear rams—1, J. E. Baker & Sons, Barronsfield, N. S.; 2, B. Goodspeed, Penniac; 3, Clover Nook Stock Farm, Hartland.
Shearling ram—1, J. E. Baker.
Ram lamb—1, and 2, J. E. Baker & Sons; 3, Clover Nook Stock Farm.
Two shear ewe—1, and 2, J. E. Baker; 3, C. Pugsley.
Shearling ewe—1 and 2, J. E. Baker.
Ewe lamb—1 and 2, J. E. Baker; 3, Clover Nook Stock Farm.
Pen of sheep—1 and 2, J. E. Baker; 3, R. Kidney.
Pen of lambs—1, J. E. Baker & Sons; 2, Clover Nook Stock Farm.

Shropshires

Two shear ram—1, A. G. Spafford, Compton, Que.; 2, G. L. Boswall, P.E. I.; 3, J. E. Baker.
Ram lamb—1 and 3, G. L. Boswall; 2, A. G. Spafford.
Two shear ewe—1 and 2, G. L. Boswall, 3, A. G. Spafford.
Shearling ewe—1, G. L. Boswall; 2, A. G. Spafford.
Ewe lamb—1 and 3, G. L. Boswall; 2, A. G. Spafford.
Pen of sheep—1, G. L. Boswall; 2, A. G. Spafford; 3, W. H. Moore, Scotch Lake.
Pen of lambs—1, G. L. Boswall; 2, A. G. Spafford.

South Downs

Two shear ram—1, J. E. Baker; 2, Elijah Saunders, P. E. I.
Shearling ram—1, E. Saunders; 2, and 3, J. E. Baker.
Ram lamb—1 and 3, E. Saunders; 2, J. E. Baker.
Two shear ewe—1, and 2, J. E. Baker; 3, E. Saunders.
Four shearling ewe—1 and 2, E. Saunders; 3, J. E Baker.
Ewe lamb—1 and 2, J. E. Baker; 3, E. Saunders.
Pen of sheep—1 and 3, J. E. Baker; 2, E. Saunders.
Pen of lambs—1, J. E. Baker; 2, E. Saunders.

Hampshire Downs

Two shear ram—1, Cephas Nunn, P. E. I.
Shearling ram—1, C. Nunn.
Ram lamb—1 and 2, C. Nunn.
Ewe two shears—1 and 2, C. Nunn.
Shearling ewe—1, C. Nunn.
Ewe lamb—1 and 2, C. Nunn.
Pen of sheep—1, C. Nunn.
Pen of lambs—1, C. Nunn.

Cheviots

Ram, two shears—1, Chas. Symes.
Shearling ram—1, C. Symes; 2, C. Nunn.
Ram lamb—1, C. Nunn; 2 and 3, C. Symes.
Ewe, two shears—1, C. Symes; 2 and 3, C. Nunn.
Shearling ewe—1, C. Nunn; 2 and 3, C. Symes.
Ewe lamb—1 and 3, C. Nunn; 2, C. Symes.
Pen of sheep—1 and 3, C. Symes; 2, C. Nunn.
Pen of lambs—1, C. Nunn; 2, C. Symes.

Dorset Horns

Ram, two shears—1 and 2, Clover Nook Stock Farm; 3, A. C. Servant, Overton.
Shearling ram—1, A. C. Servant; 2, Clover Nook Farm.
Ram lamb—1, A. Servant; 2, G. L. Boswall; 3, Clover Nook Stock Farm.
Ewe, two shears—1 and 2, A. Servant; 3, G. L. Boswall.
Shearling ewe—1, A. Servant; 2 and 3, G. Boswall.
Ewe lamb—1 and 2, A. Servant; 3, G. Boswall.
Pen sheep—1, A. Servant; 2, G. Boswall; 3, Clover Nook Stock Farm.
Pen lambs—1, A. Servant; 2, G. Boswall; 3, Clover Nook Stock Farm.

Suffolk

Ram lamb—1, A. Boswall.
Ewe, two shears—1 and 2, A. Boswall.
Shearling ewe—1, A. Boswall.
Ewe lamb—1, 2 and 3, A. Boswall.
Pen sheep—1, A. Boswall.
Pen lambs—1, A. Boswall.

Grades

Pair of ewes long wool—1, W. Craig, Nassasis.
Pair ewes, shearlings—1, Ray Burpee; 2, E. Craig.
Pair lambs—1 and 2, Ray Burpee; 3, W. Craig.
Pen two ewes, two shearlings and two lambs—1, Ray Burpee; 2, W. Craig.

Grades, Medium Wool

1, Z. R. Estey, Lr. Fr. Village.
Pair shearling ewes—1, Z. R. Estey.
Pair lambs—1, J. E. Baker.

Fat Sheep

Ewe, over one year—1 and 2; J. E. Baker; 3, C. Nunn.
Wether, over one year—1, C. Pugsley; 2, C. Nunn; 3, Clover Nook Stock Farm.
Wether lamb—1, C. Nunn; 2, and 3, J. E. Baker.

Karakule Shrop.

Ram, over one year—1 N. B. Karakule Sheep Co.
Ram lamb—1 N. B. Karakule Sheep Co.
Ewe, over one year—1, N. B. Karakule Sheep Co.

FIELD GRAINS

White Wheat—1 ,A. R. Gorham, Gorham's Bluff; 2, Donnald Innes, Tobique River; 3, W. O'Brien & Sons, Windsor Forks; 4, B. Goodspeed, Penniac.
Red wheat—1, J. A. Johnston, Chatham; 2, G. M. Weade, Royalton; 3, MacFarlane Bros., Fox Harbor Point; 4, Donald Innes, Tobique River.
Banner Oats—1, J. W. Stevenson, Gladstone; 2, Donald Innes; 3, R. J. Shaw, Maryland; 4, Z. Estey, Lr. Fr. Village.
Oats, any other varietty—1, MacFarlane Bros.; 2, Donald Innes; 3, R. J. Shaw; 4, J. W. Stevenson.
Oats black—A. R. Gorham; 2, J. W. Stevenson; 3, W. O'Brien & Sons.
Barley, two rowed—1, W. O'Brien & Sons; 2, J. W. Stevenson; 3, Donald Innes; 4, McFarlane Bros.
Barley, six rowed—1, J. W. Stevenson; 2, MacFarlane Bros.; 3, George Holmes; 4, Donald Innes.
Buckwheat, rough—1, J. W. Stevenson; 2, J. W. Smith & Son, Durham Bridge; 3, G. J. Weade; 4, Clowes Currie, Macniquac.
Buckwheat, smooth—1, W. N. Sterritt, Grey's Mills; 2, A. R. Gorham; 3, W. O'Brien & Sons.
Rye—1, W. O'Brien & Sons; 2, D. Innes; 3, George Holmes.
Field Peas, large—1, James O'Brien, Windsor Forks; 2, W. O'Brien & Sons; 3, D. Innes.
Field peas, small—1, D. Innes; 2, W. O'Brien; 3, J. A. Johnston.
Beans, white—1, J. W. Smith & Sons.
Beans, colored—1, A. R. Gorham.
Timothy seed—1, R. J. Shaw; 2, J. W. Stevenson; 3, David Curry, Tobique River.
Alsike Clover—1, J. A. Johnston.

Sheaf Grain

White wheat—1, D. Inness; 2, Chas. Parent, City; 3, George Holmes; 4, B. Goodspeed.
Red wheat—1, D. Innes; 2, MacFarlane Bros.; 3, B. Goodspeed; 4, Geo. Holmes.
Oats, Banner—1, W. H. Moore, Scotch Lake; 2, D. Innes; 3, MacFarlane Bros.; 4, A. R. Gorham.
Any other varietty—1, D. Innes; 2, A. Gorham; 3, G. Holmes.
Black oats—1, D. Innes; 2, A. Gorham; 3, B. Goodspeed; 4, G. Holmes.
Barley, two rowed—1, D. Innes; 2, MacFarlane Bros.; 3, A. Gorham; 4, G. Holmes.
Special, best bushel wheat—1, D. Inness.
Best bushel oats—1, D. Inness.
Grain in the straw—1st, D. Inness.

Potatoes

Delaware—1, W. N. Sterritt; 2, W. H. Moore; 3, R. J. Shaw; 4, A. E. Kilburn City; 5, Charles McAdam; 6, McCullough Bros.
Iirsh Cobbler—1, Bebbington, J. and Sons; 2, W. H. Moore; 3, B. Goodspeed; 4, Charles McAdam; 5, A. E. Kilburn.
Carmen—1, W. N. Sterritt; 2, F. E. & H. G. Smith, Long Reach, N.B.
Gold Coin—1, F. E. & H. G. Smith; 2, John Edgar, Springhill; 3, C. Currie.
Any white variety—1, B. Goodspeed; 2, W. N. Sterritt; 3, F. E. Smith; 4, A. H. Jewett, City.
Any Rose variety—1, A. Keene, St. Marys; 2, B. Goodspeed; 3, A. Gorham; 4, R. J. Maryland.
Any red variety—1, W. N. Sterritt; 2, B. Goodspeed; 3, McCollough Bros.; 4, Charles McAdam.
Any dark skinned variety—1, B. Goodspeed; 2, A. Keene; 3, J. A. Johnston; 4, George McKay, Kingsclear.
Swedes—1, B. Goodspeed; 2, W. Illingsworth; 3, H. Dickson; 4, Mrs. E. W. Darcus.
Turnips—1, McCollough Bros.; 2, H. Dickson; 3, W. Illingworth; 4, C. Currie.
Mangels—1, B. Goodspeed; 2, J. W. Smith & Son; 3, W. Illingworth; 4, H. Dickson.
Sugar Mangels—1, B. Goodspeed; 2, J. W. Smith & Sons.
Red Carrots—1, W. N. Sterritt; 2, B. Goodspeed; 3, Mrs. E. W. Darcus; 4, George McKay.
White carrots—1, W. N. Sterritt; 2, B. Goodspeed; 3, J. Bebbington & Son; 4, George McKay.
Pumpkins—1, Thurston Clark; 2, Alex. Murray; 3, J. Babbington & Son.
Sheaf fodder corn—1, R. J. Shaw; 2, J. W. Smith & Son; 3, B. Goodspeed; 4, J. A. Johnston.
Collection Field Roots—1, B. Goodspeed; 2, W. Illingworth; 3, J. W. Smith & Sons.

Garden Vegetables

Brussels Sprouts—1, H. Dickson; 2, J. Babbington & Son.
Beets, long—1, J. Babbington & Son, 2, B. Goodspeed.
Beets, Egyptian—1, H. Dickson; 2, John Jewett, Fredericton; 3, Mrs. T. W. Smith.
Beets, Eclipse—1, Mrs. E. W. Darcus; 2, H. Dickson; 3, John Jewett
Beans, wax podded—1, David Sharp, Fredericton; 2, F. E. & H. G. Smith; 3, Alfred Keene.
Beans, green podded—1, A. R. Gorham; 2, J. Bebbington & Son; 3, John McKay.
Cauliflower—1, J. Bebbington & Son; 2, H. Dickson.
Cabbage, white—1, Mrs. T. W. Smith; 2, Charles Jewett, Fredericton; 3, H. Dickson.
Cabbage, red—1, Charles Jewett; 2, Mrs. Smith; 3, W. J. Smith & Sons.
Carrots, intermediate—1, J. W. Smith & Son; 2, J. McKay; 3, B. Goodspeed.
Carrots, oxheart—1, B. Goodspeed; 2, J. W. Smith & Sons; 3, W. N. Sterritt.
Carrot, early horn—1, B. Goodspeed; 2, W. N. Sterritt; 3, J. Bebbington & Son.
Celery, white—1, H. Dickson; 2, J. Bebbington & Son; 3, J. W. Smith & Sons.
Celery, white plume—1, J. W. Smith & Son; 2, Mrs. Darous! 3, J. Bebbington & Son.
Celery, red—1, J. Bebbington & Son; 2, H. Dickson; 3, Mrs. Darcus.
Corn, white howling mob—1, Mrs. E. W. Darcus; 2, A. Gorham.
Golden Bantam—1, W. Sterritt; 2, A. E. Kilburn; 3, John Jewett.
Sweet—1, W. N. Sterritt; 2, A. Gorham; 3, John Jewett.
Cucumbers, best variety—1, F. E. & H. G. Smith; 2, W. Sterritt; 3, H. Dickson.
Herbs, garden—1, J. W. Smith & Sons; 2, Willard Camp.
Melons, citron—1, B. Goodspeed; 2, W. Sterritt; 3, Alex Murray.
Melons, musk—1, W. Sterritt; 2, J. W. Smith & Sons; 3, J. Bebbington & Sons.
Onions, white—1, B. Goodspeed; 2, J. Johnston; 3, F. E. & H. G. Smith.
Onions, yellow—1, Herb MacDonald, Fredericton; 2, Mrs. Darcus; 3, A. Keene.
Onions, red—1, McFarlane Bros.; 2, J. Bebbington & Son; 3, Mrs. T. W. Smith.
Onions, white pickling—1, A. Gorham; 2, B. Goodspeed.
Onions, yellow pickling—1, B. Goodspeed; 2, A. Gorham; 3, J. Bebbington.
Onions, potato—1, James Scott, Fredericton; 2, J. W. Stevenson; 3, J. W. Smith & Son.
Onions, potato—1, Femar King; 2, Mrs. Darcus.
Parsnips, hollow crown—1, Charles Jewett; 2, B. Goodspeed; 3 ,Hugh Dickson.
Peas, garden—1, Mrs. Darcus; 2, David Roberts, Fredericton; 3, Alex. Murray.
Radishes—1, J. Bebbington & Sons; 2, H. Dickson; 3, Mrs. Darcus.
Savoys—1, H. Dickson; 2, J. Bebbington & Son.
Squash, Boston Marrow—1, B. Goodspeed; 2, Alex. Murray; 3, George Pugh.
Squash, Hubbard—1, J. W. Smith & Sons; 2, John Bolster, Fredericton; 3, H. Dickson.

(Continued on Page 24)

The Chatham Exhibition

The seventh Biennial Exhibition conducted by the Miramichi Agricultural Exhibition Association was held in the town of Chatham on September 28th to October 1st inclusive.

Mr. Geo. E. Fisher, the efficient, genial manager of the fair, quite early in the season, made the following announcement to the public, through the columns of the official prize lists.

"Have you marked September 27th "to October 1st on your calendar? That "is the time of the Miramichi Agricultural Exhibition and the management, "in extending to you a hearty invita "tion to attend this, their seventh ex- "hibition, are pleased to assure you "that preparations are being made for "the finest show ever held by this "association.

"Visitors to former Exhibitions have "been surprised and delighted at the "magnificent showing of the Farm and "Garden Products, while the exhibit "of Live Stock has equalled, if it has "not surpassed that shown in any part "of the Maritime Provinces. We ex- "pect that the showing of this year "will be equal to, if not better than "any former show. The Industrial Ex- "hibit will also challenge the admira- "tion of all attendants. Special pre- "parations are being made, and with "larger Prize List than ever before, "we are assured that the showing in "these Departments will excel that of "previous Exhibitions."

Visitors to the fair found everything up to the standard predicted in the announcement. The main building was well filled with industrial exhibits. The vegetables and grain shown was the best and most artistically staged in the Maritime Provinces this year. Considering the short time since the grain harvest, the exhibit of grain threshed and in the straw was most creditable. The vegetable display was the best we have seen for a long time. Practically every vegetable grown in a northern clime was staged. Mr. Fisher showed onions 18 inches in circumference and weighing over the three pound mark. This was no freak, he had a large number of them, all grown from seed this season. The educational display staged by the Fredericton Experimental Station under the direction of Mr. Hubbard, was well patronized by the public. The young men in charge were kept busy explaining the various models of farm buildings, equipment, etc., and undoubtedly some of the ideas will be gradually put into parctice by the farmers of the North Shore.

The display of fancy work, fien arts, and household science was second to none of the respective works shown at the other fall fairs.

The Horticultural display was quite creditable but very little of it was grown on the North Shore. The St. John River Valley and Nova Scotia contributed the major portion of the apples.

Geo. H. Barr, Ottawa, judged the dairy products exhibit. He remarked that Chatham had the best display and best quality of home made butter he had judged anywhere in Canada this year. This speaks well for the careful handling of milk, cream and butter in the farm homes of northern New Brunswick. Mr. C. W. McDougall, Dairy Superintendent, conducted a demonstration on butter and cheese making which attracted considerable attention. Mrs. Benj. Lester, Apohaqui, N.B., demonstrated the work and when the cream cheese was ready to serve there was no trouble to get official tasters. We called around for our share and were it not for our extreme modesty we would have come back for a second helping—it certainly tasted like "more." Mrs. Lester is a product of the Sussex Dairy School and holds the enviable reputation of being one of the most skilful dairy butter makers in the province.

The stalls and pens of the live stock paddocks were well filled with a strong showing of horses, cattle, sheep and swine. There was also a good showing of poultry.

With a prize list open to all Canada the Chatham Exhibition attracted the best herds of Prince Edward Island Nova Scotia, New Brunswick and several herds from the Province of Quebec.

An innovation much appreciated by the exhibitors was the awarding of neat bronze medals, the crest of the Mirimichi Agricultural Exhibition Association, instead of the usual diploma ribbons and cards.

The Judges

Light Horses—John Vipond, Brooklin, Ont; Light Horses—Dr. J. A. Sinclair, N.S.A.C., Truro, N.S.; Beef Cattle—L. O. Clifford, Ontario; Dairy Cattle,—R. M. Holtby, Ontario; Dairy Grades—H. W. Corning, M.P.P., Yarmouth, N.S.; Sheep—Walter Milne, Ontario; Swine—J. B. Ferguson, Ontario; Poultry,—Seth Jones; Dairy Proucts—Geo. H. Barr.

The champion Clydesdale stallion was Kelvin's Pride, the promising yearling that snatched this coveted honor at Fredericton from the erstwhile champions, Baron's Own and Baron Squire.

Shorthorns—Fred Cromwell, of Quebec, showed the champion Shorthorn bull. R. A. Snowball, who captured eight prizes on their Shorthorns, including the medal for best Shorthorn female, any age on his aged cow, Mina Snowball, and the medal for best bull and three of his get on his Gay Archer. J. M. Laird & Son, Kelvin Grove, P.E.I. had five first, two second, one third and two fourth prizes, including medal for best Shorthorn cow and two of her progeny on Chatham Belle, to their credit. Harold Baldwin captured one first and A. G. Dickson one second prize.

Devons—W. A. Pinkney, Melbourne, N.S., had the only entries in the Devon class and was awarded all the prizes for which he had entries.

Herefords—Wm. O'Brien & Sons and Jas. E. O'Brien, Windsor Forks, N.S., were out with two well fitted herds of white faces. Honors were pretty evenly divided.

Polled Angus—All the sections of this class were well filled, J. M. Laird & Son, of Prince Edward Island, and A. G. Spafford, Compton, Que., were the competitors. Fourteen firsts, six seconds and four thirds, including the four medals went to the Prince Edward Island herd. The remainder went to Spafford

Ayrshires—McIntyre Bros., Sussex, N.B., and A. McRae & Sons, Charlottetown, were out with two splendid herds. Included in McIntyre Bros. winnings were medals for best male on their Morton Mains, Amanth, for bsst cow and two of her progeny, on their Morton Maain's Lady Nelly. In all they had ten first prizes, six second prizes, six third prizes and two fourth prizes. A. McRae & Sons captured the medal for the best bull and three of his get on their Hobsland's Tumphies' Heir, and twelve first prizes, nine second prizes and one third prize. G. G. Stothart, Newcastle, captured one second and one fourth prize and Keating Bros. captured one third prize.

Jerseys—The competition in Jerseys was just the same as at Fredericton. H. S. Pipes & Son, Amherst, N. S.; Cann Bros., Yarmouth, N.S., and Edwards & Alexander, Hillhurst, Que., were out with their best. The male championship medal and the medal for best bull and three of his get went to Cann Bros.' Figgis Fox's Gen Fox. The female championship medal winner was Edwards & Alexander's Gentle Fern of Glen View. Gentle Fern also captured the medal with two of her progeny. Cann Bros. captured 7 firsts, 4 seconds, 5 thirds and 3 fourths. H. S. Pipes & Son, 4 firsts, 8 seconds, 3 thirds, 7 fourths, and Edwards & Alexander 11 firsts, 6 seconds and 6 thirds.

Guernseys—There were three good Guernsey herds represented at Chatham. H. W. Corning, M.P.P., Chegoggin, N.S.; Roper Bros., Charlottetown, P.E.I., and Hugh A. Dickson, Central Onslow, N.S. Corning captured all the medals. Island Prince, of Hillside, was the champion male and was also first with three of his get. The champion female was Dairymaid of Hillside and Emma's Image Rose of Hillside, was first with two of her progeny. Twelve first, five seconds, four thirds and one-fourth prizes went to the Corning herd. Dickson captured two firsts, seven seconds, five thirds and three fourth prizes, and Roper Bros. had seven firsts, five seconds, five thirds and one fourth prize to their credit.

Holsteins—Harding Bros., Welsford, N.B., were the big winners in the Holstein class. R. L. Hicks, of Dalhousie Junction, was in hand with a nice little herd which captured 4 firsts, 4 seconds and 3 third prizes, including the medal for the best female, any age, on his Eloise De Kol Netherland, shown in the aged dry cow class. The championship male was Harding Bros.' Percellas Schuling Posch, a senior calf, out of Percella Ina Abbekirk, by Schuling Sir Posch, Hotel Dieu Farm, Chatham, had one fourth prize to its credit.

Canadians—John Hooper and Hooper Bros., Compton, Que., showed two herds of thrifty Canadian cattle. The Hooper boys, who are brothers of Mr. Thomas Hooper, the popular horseman at the N. S. A. C. are heartily welcomed to the Maritime Province show rings.

Dairy Grades were a good useful lot

Sheep

Cotswolds—All prizes to Chas. Symes, N.S.

Leicesters—The Boswalls of Prince Edward Island were on hand with two nice flocks of Leicesters.

Lincolns—Were shown by the Boswalls and also by C. D. Pugsley, River Herbert, N.S. The Boswalls captured 6 firsts, 4 seconds and 4 third prizes. Pugsley had 2 firsts, 4 seconds and 3 third prizes to his credit.

Oxfords—J. E. Baker & Sons, of Barronsfield, N.S., and J. M. Laird & Son, Kelvin Grove, P.E.I., were the competitors in the Oxford Down class. The majority of the first prizes went to the Nova Scotia flock. The Prince Edward Island flock won one first, three second and three third prizes.

Shropshires—A. G. Spafford, Compton, Que., and the Boswalls, of Prince Edward Island, divided the honors in the Shropshire class, the lion's share going to the Boswalls.

South Downs—Two nice flocks of the big little South Downs were at Chatham. J. E. Baker & Sons won 5 firsts, 5 seconds and 2 thirds and the remainder of the prizes went to Elijah Saunders, Winsloe, P.E.I.

Hampshires—Cephas Nunn, of Winsloe, P.E.I., captured the greater number of prizes in the Hampshire class, the Boswalls, his only competitors, captured one first, two second and three third prizes.

PRIZE LIST

HORSES

Thoroughbreds

George M. Holmes, Amherst, took all the awards in this class.

Hackneys

Stallion, 3 years—R. A. Snowball, 1; Dr. W. B. Jones.

Stallion, 1 year—W. M. Johnston, 1.

Filly, 2 years—R. A. Snowball, 1; Geo. M. Holmes, 2.

Filly, 1 year—R. A. Snowball, 1; W. M. Johnston, 2.

Foal of 1915—W. M. Johnston, 1; Maher Bros., 2.

Brood mare with foal—W. M. Johnston, 1; Maher Bros., 2.

Special prize donated by Canadian Hackney Horse Society for best stallion any age or height.—R. A. Snowball, 1. Best mare, any age or height, W. M. Johnston, 1.

Special prize donated by R. A. Snowball for progeny of horses at Meadow Brook Farm—Best filly or gelding, 2 years or over; sired by Baron Balgreggan—Robert McEwen, 1.

Filly or gelding, 1 year or under, sired by Baron Balgreggan or Baron's Own—Wm. M. Morrison, 1.

Standard Bred.

Stallion, 3 years old and upwards—Hammond Kelly, 1; Edward Dalton, 2; McFarlane Bros. 3.

Filly, 3 years and upwards—Geo. M. Holmes, 1.

Filly, 2 years old—Geo. M. Holmes, 1.

Foal of 1915.—R. Cox, 1.

Brood mare with foal by her side—R. Cox, 1.

Stallion, any age—McFarlane Bros., 1.

Mare, any age—Geo. M. Holmes, 1.

Coach Horses

Stallion, 2 years old and filly, 3 years old and upwards.—A. & R. Loggie, 1.

Clydesdales.

Stallion, 4 years and upwards—R. A. Snowball, 1; McFarlane Bros. 2.

Stallion, 3 years old—McFarlane Bros., 1; A. T. Hinton, 2.

Stallion—2 years old—McFarlane Bros., 1; A. T. Hinton, 2.

Stallion, 2 years—R. A. Snowball, 1; R. O'Leary, 2.

Stallion, 1 year old—R. A. Snowball, 1.

Filly, 3 years old and upwards—R. A. Snowball, 1; McFarlane Bros., 2, 3.

Filly, 1 year old—McFarlane Bros., 1, 2; H. S. Pipes & Sons, 3.

Foal of 1915—Wm. Morrison, 1; McFarlane Bros., 2.

Brood mare with foal—McFarlane Bros., 1; Wm. Morrison, 2.

Stallion, any age—R. A. Snowball, 1.

Mare, any age—R. A. Snowball, 1.

Stallion and three of his get—R. A. Snowball, 1.

Clydesdale stallion, any age—R. A. Snowball, 1.

Clydesdale mare, any age—R. A. Snowball, 1.

Best filly or gelding sired by Clydesdale stallion—R. A. Snowball, 1; McFarlane Bros., 2, 3.

Filly or gelding, 2 years, sired by Model Performer—W. B. Snowball, 1.

Filly or gelding, sired by Model Performer, 1 year—Donald Watling, 1.

Percheron

Stallion, 4 years and upwards and stallion with 3 of his get—A. T. Hinton, 1.

Saddle Horses

Ridden by gentleman, Hammond Kelly, 1; Geo. W. Holmes, 2; Geo. J. Dickson.

Ridden by lady—Beverly Jardine, 1.

Carriage Horses to Talter

Brood mare, with foal—Geo. W. Holmes, 1; James W. Flannagan, 2.

Filly or gelding, 3 years old.—A. & R. Loggie, 1; Roger Flanagan, 2.

Filly or gelding, 2 years old—Patrick Martin, 1; James W. Flanagan, 2; Ellis Stothart, 3.

Yearling filly or gelding—Geo. M. Holmes, 1; Keating Bros., 2.

Foal of 1915—Geo. M. Holmes, 1; Donald Watling, 2; James W. Flanagan, 3.

SAVE
THOSE APPLES
by using a
Maxwell
Cider Press !

HOW many go to waste that might be turned into Cider or Cider Vinegar with a small investment! MAXWELL PRESSES are wel made, of the best material, heavy, substantial frame, and cross section of extra weight and strength; furnished with two crates, galvanized hoops, and tinned rivets. Made for either hand or power.

MAXWELLS LIMITED
ST. MARY'S, ONT.

Carriage Horses to Harness

Filly or gelding, 2 years old—Geo. M. Holmes 1.

Pair matched carriage horses—W. B. Snowball, 1; R. A. Snowball, 2; Geo. M. Holmes, 3.

Single horse, 15½ hands and over—John McKeen, 1; L. G. Babineau, 2.

Mare and 3 of her progeny—James W. Flanagan, 1.

Best horse, any age—W. B. Snowball, 1.

Mare or gelding, driven by lady——as. D. Johnston, 1; A. T. Hinton, 2; Harold Baldwin, 3.

Light Draught

Mare or gelding, 4 years old and upwards—W. S. Loggie Co., 1; Creighton Bros., 2; Roger Flanagan, 3.

Mare or gelding, 3 years old—Robt. McEwen, 1.

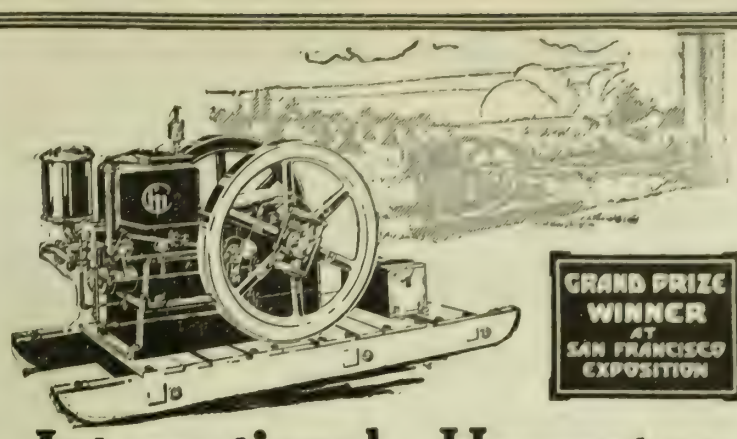
Iron-Rust Preventatives.

P. M.: There are several easy ways to prevent the rusting of ploughs and cultivators and to keep the teeth bright. One is to give them a coat of thick limewash as soon as they are brought in from the field. Another way is to dissolve 1 oz. of resin in 4 oz. of linseed oil, and while hot mix this with a quart of kerosene, and stir well. This is laid on the smooth iron with a paint brush. Another way is to dissolve 1 oz. of camphor in some turpentine, and add t this 4 oz. of lard and 1 oz. of pulverized black lead or stove polish, and mix well. This may be rubbed on with a rag. To remove rust from plows or tools, nothing is better than a mixture of half a pint of oil of vitriol poured slowly into a quart of water and apply this to the rusted metal. Wash out with water.



International Harvester
Oil Engines—Mogul—Titan

THE buying of the right engine for the farm is a family affair. Your wife, the boys, the girls, the help—everybody about the place will be helped so much by the engine that it pays to buy carefully. Get a good engine, a **Mogul** or **Titan,** give it all the jobs it will do and handle it properly, and it will still be shouldering the drudgery years from now.

Buy an **International Harvester** engine—**Mogul** or **Titan.** In time the family will come to look on it as a faithful ever-reliable friend. It will keep down your fuel and repair bills, deliver the most power with least trouble, and save you more hard work than you can realize now.

International Harvester engines are made in all approved styles, sizes from 1 to 50-horse power, operating on low as well as high-grade fuels. Some local dealer near you handles **Mogul** or **Titan** engines. If you don't know him, drop us a line. We'll send you full information, and make it easy for you to see the best farm engine made.

Bloody Milk.

I have a seven-year-old cow that gives bloody milk. She recently gave birth to a calf. What is the cause and what treatment do you advise?—M. McKenzie, Cape Breton.

Bloody milk is caused either by an injury to the udder or to a weakness of the udder blood vessels. It is usually seen in new milkers, especially heifers. Bathe the udder once a day with warm water and rub in a little camphorated oil.

Will Pump 1000 Gallons of Water an Hour

No. 1, Price $48.

And pumping is but one of many labor-saving jobs that can be done on any farm with a

FAIRBANKS-MORSE
ECLIPSE ENGINE

It can be easily moved from place to place and put to work in a few minutes time—grinding, pulping, sawing, hoisting or any other light work of this nature. In fact, its uses are practically unlimited.

DAIRYING.

Value of Scales and Babcock Test.

One time a friend asked me how many cows I had and I told him 18. He asked me what kind they were and I told him 18 kinds, but all giving milk. I had selected those cows with considerable care. I had paid attention to the five essential points that should always be borne in mind in selecting dairy cows but somehow or other the living I made was lean. I figured out the ration so fine that it seemed as if I were doing a big part of the work that nature had actually intended those cows to do, and yet the living I got was not high. Finally I got a milk scale and hung it up in the barn. I placed a piece of paper on a board near by and I told the boys that from then on we would keep a tally on the cows. We started in weighing every cow's milk every morning to see what it would tell. It was only a short time before I became so interested in that tally that I told the boys to weigh the milk from each cow every night and put that weight on the tally too.

I figured out before starting that to keep a cow for a year would equal an amount equivalent to the value of 6,000 pounds of milk. A year rolled around and I recapitulated. After all I had done for some of those cows they had me headed for the poor-house. It was like this: Expenses: 6,000 pounds of milk; returns, 4,000 pounds of milk; result, poorhouse.

I said that hereafter in the herd 6,000 pounds of milk as a year's yield would be our deadline. In culling the old herd we sold some to the butcher and some to the bologna man, and there were one or two that I could not get rid of at all. But I had to get rid of those cows; they were putting me in the hole every day. I do not expect a young heifer with her first calf to give enough milk to place her up in the tally with mature cows. The heifer is growing and in her growth we realize a profit, so that if she gives 4,500 to 5,00 pounds of milk, she is doing very well and we are satisfied.

We had placed our herd above the deadline, but I saw a probability that some of those cows which were hovering between life and death on the deadline were giving milk of a quality that would entitle them to a greater consideration and I began to wonder about some way in which we could carry our investigations further. I got some tumblers made of clear glass, and took a sample of the milk of each cow. I put my samples in the tumblers, marking each tumbler, and after they had stood a few hours, I began to watch the cream on them. I found on some of the samples just a little bit of cream and on others twice as much, and on others so much that it surprised me. Then when I examined further I thought there was a difference even in the density of the cream and I wanted more light. At a dairy supply house I found a little box marked, "Babcock test, Four Bottles," and I took it home. We tested our herd all through. I received a great light when I began to use the scales, but when I began to use a Babcock tester, I commenced to receive revelations in the dairy business.

There was Old Biddy giving 64 pounds of milk a day and old Mimie 54 pounds, that had me headed right for jail, and I thought they were keeping me out of the poorhouse. Biddy's milk tested 3.4 per cent and Mimie's 2.6 per cent butterfat and the law in my town demanded a test of 3.2 per cent butterfat, or fine or imprisonment or both.

The only reason in the world that I am called a successful dairyman now is that I have kept out of the poor-house and never been in jail, a pretty good record for a fellow who has been in the milk business over 15 years. If any one is following that same road I did he should get to work forthwith and use the scales an dtest. Quit guessing, get down to facts. Weigh the milk and test the cows.—Ben. R. Eldridge in Breeders' Gazette.

Court Manners in the Cow Barn.

Speak kindly to the gentle cow, and never, never tease her;
Take off your hat; politely bow; do all you can to please her.
Be sure your hands have been washed clean; be sure your nails are curried:
More milk is drawn from cows serene than from the cow that's worried.
—Mother Goose's Modern Maxims for Milkers.

"Kicking the cow has not been good form for some time in even moderate ly advanced dairy circles," says the Chicago Herald, "though the ban upon it probably originated more in practical than humane considerations. Painful experience warranted the conclusion that the cow thus approached was far more likely to kick the milker through the side of the barn.

"Of late years, the cow-barn code of manners and morals, has developed rapidly from the negative to the positive style—from 'thou shalt nots' to 'thou shalts.' It has been discovered that the cow, long the poet's livestock emblem of placidity, has nerves, and should be soothed and not censured when she is disinclined to 'give down' her lacteal bounty.

"Not only pitchforks, milking stools, single-trees and fence stakes have fallen into disrepute as cow persuaders; bad language is also under ban. The cow physiologists and psychologists of the agricultural colleges seem to have conclusively demonstrated that the cow addressed in profane or even harsh language, gives less milk for the same amount of feed.

"Even the tone of voice is said to make a difference. The ears of the cow, though less mobile than the mules, are still sensitive. They are irritated by strident squeals and rough gutterals. The milker, who is gifted by nature, or has acquired the art, the low, sweet, soothing 'drawing room' tone of cultured society, is averred to find his reward in an increased yield of milk.

"Thus it has come to pass that the up-to-date code of cow-barn manners includes many things not dreamed in the cow philosophy of our grandfathers. Not only must the milker's hands be clean, but the nails should be manicured, that they may not scratch or tickle. From the most up-to-date dairies the currycomb has been banished as the instrument of the cow's matutinal massage. Its place has been taken by the vacuum cleaner.

"These statements are not humorous exagerations. They are derived from most serious monographs issued from scientific experiment stations and from the rules laid down for employees by enterprising dairymen. A current news item records that a New Jersey dairyman has now provided a professional manicure to see that the milkers' nails are in order before they begin to milk.

"In logical development of these advanced ideas we shall doubtless hear next that it is no longer in order to recite on entering the cow barn the old nursery rhyme:

"Come, pretty cow, let down your milk, and I will give you a gown of silk."

"These are realistic as well as scientific days in the dairy, and the cow should accordingly be promised something she could both use and enjoy. Perhaps this might be substituted:

" 'Come, pretty cow, I need the cash; for milk I'll give you a warm bran mash.'

"Then, while milking, the milker might recite soothing selections from the poets in praise of the cow. The Vedic Hymns contain a large number of such poems. They are commended to the attention of the the modern bucolic muse as sources of inspiration. Then, when the operation is concluded the milker might recite Ann Taylor's lines:

"Thank you, pretty cow, that made pleasant milk to soak my bread,' etc.

"However, anyone who has ever tried it must remain skeptical of the possibility of teaching a calf to drink without using language that would not be admitted to a family newspaper. That's a task like driving mules."

Turnip Taste in Butter.

Those German investigators Weigmann and Wolff, have recently published results of observations in connection with the smell and taste of swede turnips in butter and milk. Most of us have been of the impression that the turnip smell was something of the nature of an odor which went right through a cow and emerged in the milk in a concentrated form. Just

Cures Biliousness Prevents Bright's Disease

The Certified Statement of One Who Has Proven the Efficiency of Dr. Chase's Kidney-Liver Pills.

Mr. Colin M. Kiel, Craighurst, Simcoe county, Ontario, writes: "My mother and I have both used Dr. Chase's Kidney-Liver Pills with great satisfaction. We find that there is nothing to equal them as a prompt cure for torpid liver, biliousness and indigestion. Some years ago my mother came near to death from kidney trouble and has to be careful in preventing Bright's disease. By using Dr. Chase's Kidney-Liver Pills occasionally she keeps the kidneys healthy and active. Another point favorable to Dr. Chase's Kidney-Liver Pills is that they do not gripe and yet accomplish good results. You are at liberty to use my letter."

This statement is endorsed by Mr. Marmaduke Caston, Justice of the Peace, who writes: "This is to certify that I am personally acquainted with Mr. Colin M. Keil and believe his statement regarding Dr. Chase's Kidney-Liver Pills to be true and correct."

If you are interested in this case, write to Mr. Keil, enclosing stamp for reply, and he will verify his statement. We like to have people to do this, for we are very careful to only use statements from responsible persons.

Should this case not be similar to yours, write to us for the statement of some one whose trouble was along the same lines. We have thousands of letters to choose from. Or better still, put the Kidney-Liver Pills to the test right away. They will only cost you a quarter and a box lasts for some time.

As a means of awakening the action of liver, kidneys and bowels and thereby curing biliousness, indigestion, backache and kidney troubles, Dr. Chase's Kidney-Liver Pills hold a unique position. By their combined action on these eliminating organs they prove effective in complicated ailments which defy ordinary treatment. One pill a dose, 25 cents a box, all dealers, or Edmanson, Bates & Company, Limited, Toronto.

Renfrew Standard

It starts without cranking

Some makes of engines offered for sale have high tension magneto but no batteries. Others have batteries but no magneto. Now, if anything happens to either ignition system, it means that the engine is stuck and the work held up.

The ideal equipment is the dual ignition system of the Renfrew Standard gasoline engine. It has high tension magneto and the batteries, too. It thus has two separate and complete ignition systems, on either of which you can operate the engine. This reduces the possibility of a tie up to a minimum, and makes the engine one you can bank on for rendering efficient and satisfactory service all the time.

Lever type friction clutch pulley of the best grade supplied without charge with every engine of 6 h.p. and over.

Grain Grinders, Saw Frames and B. Bell & Son Ensilage Cutters furnished at reasonable prices.

Standard Skims to .01 percent

The Standard Cream Separator skims so close, so very close, that the Babcock tester shows that only one-tenth of a pound of butter fat is lost in one thousand pounds of milk skimmed. Think of it! Only one-tenth of a pound! Merely 2½ cents worth of butter fat lost in every 1,000 lbs. of milk skimmed. And with all this economy in skimming you get the easy turning, the conveniently low supply can, the self oiling system, for all of which the Standard is noted.

You need this close skimmer in your dairy.

Renfrew Truck Scale

Wheels around like a truck. Weighs anything from 1 lb. to 2,000 lbs., cattle included. Soon pays for itself. No farm should be without one. Government inspected. Absolutely accurate.

THE A. R. WILLIAMS MACHINERY CO., Ltd.

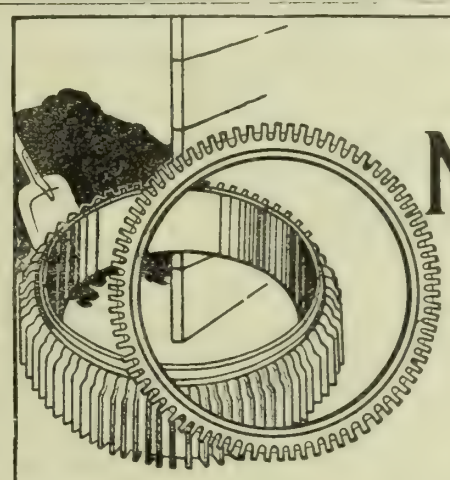
15 Dock St., ST. JOHN, N. B.

how such an intangible thing as an odor got through a cow, and particularly through the transformation of turnips to milk we have not been able to explain. However, here is what the investigators says:

The taste of swedes in butter is attributed for the most part to bacterial action and only for the very least part to a somewhat stronger smell and taste of the cow than is found in ordinary milk. We further recognize that the bacteria which cause this secondary flavor are not new and special ones, but those which are generally found in milk, especially bacterium coli, lactic acid bacteria, Actinomyces oderifer, besides some mycelia rarely found in milk.

It is further stated that the swede flavor was due to strains of B. coli together with other species, among which is to be mentioned Bacterium fluorescens liquefaciens, which possesses to a greater degree the power of producing the taste of swedes and carrots in milk. The observations on the latter taste were made on the occasion of investigating a milk which was designated as "bitter" and subject to "premature curdling," in which this bacterium was prevalent together with members of the coli-aerogenes group, short alkaline bacilla and cocci. The glass plates on which the milk was laid smelt distinctly and strongly of carrots, and the milk inoculated with the isolated bacteria took after 24 hours the same strong taste and smell.

The taste of swedes caused by Bacterium fluorescens liquefaciens is exceedingly acute an dstrong, and could be studied in a number of cases. On several occasions, when the above bacterium was present, instead of the swede taste a fine pineapple or strawberry flavor could be detected. In other instances the Bacterium fluorescens did not produce the swede taste when alone but only in the presence of other bacteria, especially of lactic and acid bacteria. The latter alone may even be the cause of the deefctive taste of the milk, from which it follows that they also are capable of giving the swede taste to butter. This is perhaps rather more of a taste of "fodder," which becomes stronger and more distinctly swede-like as soon as other bacteria or fungi possessing similar properties are present.



N GUARD

—to save your coal.

—to give you more heat by stopping waste via the chimney route.

This check against waste, is the STEEL RIBBED Fire-pot found only in the Hecla Furnace.

WAS SO WEAK

WOULD HAVE TO STAY IN BED.

Milburn's Heart and Nerve Pills Cured Her.

Mrs. J. Day, 234 John St. South, Hamilton, Ont., writes: "I was so run down with a weak heart that I could not even sweep the floor, nor could I sleep at night. I was so awfully sick sometimes I had to stay in bed all day as I was so weak. I used three and a half boxes of Milburn's Heart and Nerve Pills, and I am a cured woman to-day, and as strong as any one could be, and am doing my own housework, even my own washing.

"I doctored for over two years, but got no help until I used your pills."

Milburn's Heart and Nerve Pills are 50c per box, 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Heifer calf, under 1 year and over 6 months—1, Frank H. Roper; 2, Roper Bros.

Heifer calf, under 6 months and over 3 months—1, Frank H. Roper; 2, Roper Bros.

Herd consisting of 1 bull and 4 females, over 2 years old and owned by exhibitor—1, Frank H. Roper; 2, Roper Bros.

Breeders' young herd, to consist of 1 bull and 4 females, under 2 years of age; bull to be owned and females both owned and bred by the exhibitor—1, Roper Bros.

Champion bull, any age—1, Roper Bros.

Champion female, any age—1, Frank H. Roper.

CLASS 22—Holstein-Friesian.

Bull, 3 years old and upwards.—1, Lea Clark, Victoria; 2, W. J. Gibson, Marshfield; 3, R. B. McKinley, North River.

Bull, 2 years old—1, A. Roy Jones, 2 and 3, Lea & Clark.

Bull, 1 year old—1, 2 and 3, Lea & Clark; 4, A. H. Boswell, Little York.

Bull calf, under 1 year old and over 6 months—1 and 2, Lea & Clark.

Bull calf, under 6 months and over three months—1, Lea & Clark; 2, W. G. Gibson.

Cow in milk or calf, 3 years old and upwards—1, 2 and 3, Lea & Clark.

Cow in milk or calf, 2 years old—1, 2 and 3, Lea & Calrk.

Heifer, 1 year old—1, 2 and 3, Lea & Clark.

Heifer calf, under 1 year and over six months—1 and 2, Lea & Clark.

Heifer calf, under 6 months and over three months—1, Lea & Clark.

Herd consisting of 1 bull and 4 females, over 2 years old and owned by exhibitors—1, H. McRae & Sons; 2, Lea & Clark.

CLASS 23.—Shorthorn, Hereford, Polled Angus or Galloway Grades

Cow, 4 years old and upwards, in milk or calf—1, G. L. Hayden, Cherry Valley; 2, J. A. Stewart, Southport; 3, Vernon McMillan, Charlottetown; 4, H. A. Robertson, Alexandra; 5, Cass Bros., North River.

Cow in milk or calf, 3 years old—1, J. A. Stewart.

Heifer, 2 years old and under 3—1, S. L. Boswell, Pownal; 2, Joseph Praught, Pownal; 3 Cass Bros.

Heifer, 1 year old—1, J. W. Callbeck & Sons, Summerside; 2, Cass Bros., North River; 3, A. A. McBeth, Marshfield.

Heifer calf, under 1 year and over 6 months—1, G. L. Hayden, Cherry Valley; 2, J. A. Stewart, Southport.

Heifer calf, under 6 months and over 3 months—1, Almon Boswell, Marshfield; 2, J. A. Stewart.

SPECIAL PRIZES—Given by the Holsteni-Friesian Association

Champion bull—1, Lea & Clark, Victoria.

Champion female—1, Lea & Clark.

Three animals, either sex, the get of one sire—1 and 2, Lea & Clark.

Two animals, either sex, the progeny of one cow—1, Lea & Clark; 2, Lea & Clark.

CLASS 24.—Ayrshire Grades

Cow, 4 years old and upwards, in milk or calf—1, H. A. Robertson, Alexandra; 2, and 3, A. McRae & Sons, Charlottetown; 4, C. H. Robertson, Marshfield; 5, Calvin W. Wood, Southport.

Cow in milk or calf, 3 years old.—1, and 2, C. H. Robertson; 3, Wm. Gregory, Royalty.

Heifer, 2 years old and under 3,—1, C. Tupper Ferguson, Marshfield; 2, C. H. Robertson, Marshfield; 3, Robert Stewart, Winsloe Station.

Heifer, 1 year old—1, A. McRae & Sons; 2, C. H. Robertson; 3, Robert Stewart.

Heifer calf, under 1 year and over six months—1, Calvin W. Wood; 2, Byrne Bros., North River; 3, Robert Stewart.

Heifer calf, under 6 months and over 3 months—1, Calvin W. Wood.

CLASS 25.—Jersey or Guernsey Grades

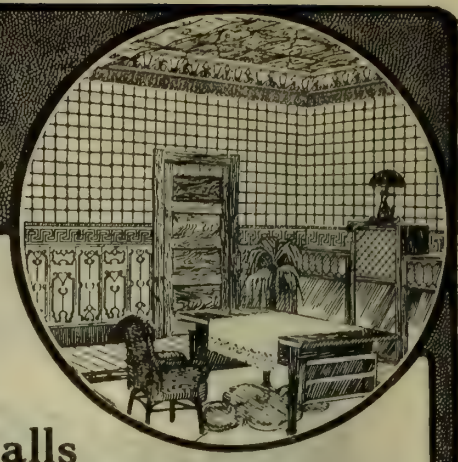
Cow, 4 years old and upwards, in milk or calf—1, J. A. Roper, Charlottetown Royalty; 2, Benjamin Rodd, Brackley Pt. Road; 3, J. A. Roper; 4, Frank H. Roper, Charlottetown Royalty; 5, A. McRae & Sons, Charlottetown Royalty.

Cow in milk or calf, 3 years old.—1, Robert Stewart, Winsloe; 2, J. A. Roper; 3, Wallace Stead, Highfield.

Heifer, 2 years old and under 3,—1, J. A. Roper; 2, Lea & Clark, Victoria; 3, Roper Bros., Charlottetown.

Heifer, 1 year old—1, Stephen Holroyd, City; 2, and 3, Robert Stewart.

Heifer calf, under 1 year and over 6 months—1, J. A. Roper; 2, Frank H. Roper.



Beautiful Walls For Your Home Sanitary, Fire-Proof, Inexpensive

Make your home more attractive, and protect it from fire with these beautiful, sanitary

"Metallic" Ceilings and Walls

They will out-last the building and are very inexpensive. They can be brightened from year to year with a little paint at a trifling cost. Made in innumerable beautiful designs suitable to all styles of rooms. Can be erected over old plaster as well as in new buildings. Write for catalogue.

We manufacture a complete line of Sheet Metal Building Materials. 9

To the person showing the greatest skill in judging beef cattle—1, Harold Leard, Kelvin Grove; 2, Cass Bros., North River; 3, Major McRae, Charlottetown; 4, Earle McRae, North Wiltshire; 5, A. L. Cairn's, Freetown.

CLASS 28—Steers

Best pair fat cattle, 2 years old—1, J. M. Leard & Son, Kelvin Grove.

Best single fat animal, 2 years old—1, J. M. Leard & Son; 2, J. M. Leard & Son.

Best single fat animal, 1 year old—1, Vernon McMillan, Charlottetown; 2, J. M. Leard & Son.

Best pair of steers, calves of 1915—1, Samuel C. Lane, Pownal.

SHEEP

CLASS 30—Leicesters.

Ram, 2 shears and over—1, Albert S. Boswell, Pownal, Lot 49; 2, Samuel C. Lane, Pownal, Lot. 49; 3, L. Boswall, Pownal, Lot 49.

Ram, shearling—1, Albert S. Boswall; 2 and 3, Samuel C. Lane.

Ram Lamb—1, 2 and 3, Albert S. Boswall.

Ewe, 2 shears and over, having reared a lamb this season—1, Albert S. Boswall; 2, S. L. Boswall; 3, Samuel C. Lane.

Ewe shearling—1, Samuel C. Lane; 2, Albert Boswall; 3, S. L. Boswall.

Ewe lamb—1, Albert S. Boswall; 2, S. L. Boswall; 3, Samuel C. Lane

Flock of Leicesters, consisting of ram and 4 females consisting of 2 ewes, each to have reared a lamb this season, one shearling ewe and one ewe lamb—1, Albert S. Boswall; 2, Samuel C. Lane; 3, S. L. Boswell.

CLASS 31.—Cotswolds.

Ram, 2 shears and over—1, John Tweedy, Earnscliffe.

Ram, shearling—1, John Tweedy, Earnscliffe; 2, George W. Woods, Hazelbrook.

Ram lamb—1, John Tweedy, Earnscliffe; 2, Harvey Tweedy, Earnscliffe; 3, George W. Woods, Hazelbrook.

Ewe, 2 shears and over, having reared a lamb this season—1, John Tweedy; 2, John Tweedy: 3, Harvey Tweedie.

Ewe Shearling—1, John Tweedy; 2, Harvey Tweedy; 3, George W. Woods

Ewe lamb—1, John Tweedy; 2, Harvey Tweedy; 3, George W. Woods.

Flock of Coltswolds, consisting of ram and 4 females consisting of 2 ewes, each to have reared a lamb this season, one shearling ewe and one lamb—1, John Tweedy; 2, Harvey Tweedy; 3, George W. Woods.

CLASS 32.—Lincolns

Ram, two shears and over—1, Albert Boswall, French Fort; 2, Ernest Lund, Mt. Herbert.

Ram, shearling—1, Almon Boswell; 2, Albert Boswell.

Ram lamb—1, and 2, Albert Boswell.

Ewe, 2 shears and over having reared a lamb this season—1 and 3, Ernest Lund, Mt. Herbert; 2, Albert Boswell.

Ewe, shearling—1, Albert Boswell; 2 and 3, Ernest Lund.

Ewe almb—1, Albert Boswell; 2, Ernest Lund; 3, Albert Boswell.

Flock of Lincolns, consisting of ram and four females, the females to consist of two ewes, each to have reared a lamb this season, one shearling ewe and one lamb ewe—1, Albert Boswell; 2 and 3, Ernest Lund.

CLASS 33—Southdowns

Ram, two shears and over—1, J. W. Bentley, Kensington; 2, Elijah Saunders, Winsloe Road; 3, Oliver Saunders, Winsloe Road

Ram, shearling—1, Elijah Saunders; 2, Oliver Sounders.

Ram lamb—1, Oliver Saunders; 2, Oliver Saunders; 3, J. W. Bentley.

Ewe, 2 shears and over, having reared a lamb this season—1 and 3, Oliver Saunders; 2, Elijah Saunders.

Ewe shearling—1, Elijah Saunders; 2 and 3, Oliver Saunders.

Ewe lamb—1, J. W. Bentley; 2 and 3, Oliver Saunders.

Flock of Southdowns, consisting of ram and four females, the females to consist of two ewes, each to have reared a lamb this season, one shearling ewe and one ewe lamb—1, Elijah Saunders; 2, Oliver Saunders; 3, J. W. Bentley.

CLASS 34—Shropshire Downs

Ram, two shears and over—1, Geo. S. Boswell.

Ram shearling—1, George S. Boswell; 2, Oliver Munn, Winsloe.

Ram lamb—1 and 3, George S. Boswell; 2, Almon Boswell.

Ewe, 2 shears and over, having reared a lamb this season—1 and 2, George S. Boswell; 3, Almon Boswell.

Ewe shearling—1 and 2, George S. Boswell; 3, Almon Boswell.

Ewe lamb—1 and 2, George S. Boswell; 3, Almon Boswell.

Flock of Shropshire Downs, consisting of ram and four females, the females to consist of two ewes each to have reared a lamb this season, one shearling ewe and one ewe lamb—1 and 3, George S. Boswell; 2, Almon Boswell.

CLASS 35.—Oxford Downs.

Ram, two shears and over—1, A. H. Boswell, Little York.

Ram, shearling—1, 2 and 3, J. M. Leard & Son, Kelvin Grove.

Ram lamb—1, J. M. Leard & Son; 2, A. H. Boswell.

Ewe, 2 shears and over, having reared a lamb this season—1, 2 and 3, J. M. Leard & Son.

Ewe lamb—1, A. H. Boswell; 2 and 3, J. M. Leard & Son.

Flock of Oxford Downs, consisting of ram and four females, the females to consist of two ewes, each to have reared a lamb this season, one shearling ewe and 1 ewe lamb—1 and 3, J. M. Leard & Son; 2, A. H. Boswell.

CLASS 36—Suffolks

Ram, 2 shears and over—-1, Albert Boswell, French Fort.

Ram, shearling—-1, Albert Boswell.

Ram lamb—1, Almon Boswell; 2 Albert Boswell.

Ewe 2 shears nd over, having reared a lamb this season—1 and 2, Albert Boswell; 3, Almon Boswell.

Ewe shearling—1, Albert Boswall; 2, Almon Boswell.

Ewe lamb—1, Albert Boswell; 2, Almon Boswell.

Flock of Suffolks, consisting of ram and four females, the females to consist of two ewes, each to have reared a lamb this season, one shearling ewe and 1 ewe lamb—1, Alber. Boswell, 2, Almon Boswell.

CLASS 37.—Hampshire Downs

Ram, 2 shears and over—1, Almon Boswell, Marshfield.

Ram shearling—1, Cephas Nunn, Winsloe.

Ram lamb—1, Cephas Nunn, Winsloe; 2, Oliver Nunn; 3, Almon Boswell.

Ewe, 2 shears and over, having reared a lamb this season—1, Oliver Nunn; 2, Cephas Nunn; 3, Almon Boswell.

Ewe shearling—1, Almon Boswell; 2, George S. Boswell; 3, Cephas Nunn.

Ewe lamb—1 and 3, Cephas Nunn; 2, Oliver Nunn.

Flock of Hampshire Downs, consisting of ram and four females, the females to consist of two ewes each to have reared a lamb this season, one shearling ewe and 1 lamb—1, Cephas Nunn; 2, Almon Boswell; 3, Oliver Nunn.

Dorset Horns

Ram, 2 shears and over—1, George S. Boswell; 2, John Tweedy, Earnscliffe.

Ram lamb—1, John Tweedy; 2 and 3, George S. Boswell.

Ewe, 2 shears and over, having reared a lamb this season—1 and 2, George S. Boswell; 3, Lois Taylor, city.

Ewe shearling—1, and 2, George S. Boswell; 3, John Tweedy.

Flock of Dorset Horns, consisting of ram and four females, the females to consist of 2 ewes, each to have reared a lamb this season; 1 shearling ewe and 1 ewe lamb—1 and 3, George S. Boswell; 2, John Tweedy.

Cheviots

Ram, 2 shears and over—1, Robert Furness, Vernon Bridge.

Ram shearling—1, Cephas Nunn; 2, Robert Furness.

Ram lamb—1, Robert Furness; 2, Cephas Nunn.

Ewe, 2 shears and over, having reared a lamb this season—1 and 2, Robert Furness; 3, Cephas Nunn.

Ewe shearling—1, Robert Furness.

Ewe lamb—1 and 2, Robert Furness.

Flock of Cheviots, consisting of ram and four females, the females to consist of 2 ewes, each to have reared a lamb this season; 1 shearling ewe and 1 ewe lamb—1, Robert Furness.

CLASS 40—Long Wool Grades

Ewe, 2 shears and over, having reared a lamb this season—1 and 2, Ernest Lund, Mt. Herbert; 3, Robert Furness; 4, S. L. Boswell, Pownal; 5, Samuel C. Lane.

Ewe shearling—1 and 3, S. L. Boswell; 2, Robert Furness.

Ewe lamb—1, S. L. Boswell; 2, Albert Boswell; 3, Ernest Lund.

Wether shearling—1 and 4, S. L. Boswell; 2, Samuel C. Lane, Pownal.

Wether lamb—1, S. L. Boswell, 2, Robert Furness; 3, Samuel C. Lane.

Best fat ewe or wether—1, S. L. Boswell; 2, Samuel C. Lane; 3, Ernest Lund, Mt. Herbert.

CLASS 41—Short or Medium Wool Grade

Ewe, two sheers and over, having reared a lamb this season—1, Oliver Saunders; 2, Robert Furness, Vernon River Bridge; 3, Oliver Saunders; 4, George W. Woods, Hazelbrook; 5, Elijah Saunders, Winsloe Road.

Ewe shearling—1, Elijah Saunders; 2, Albert S. Boswell; 3, A. H. Boswell.

Ewe lamb—1, Oliver Saunders; 2, Elijah Saunders; 3, A. H. Boswell.

Whether shearling—1, Almon Boswell; 2, Oliver Saunders; 3, Elijah Saunders.

SWINE

CLASS 42—Berkshires.

Boar, 2 years old and upwards—1, H. T. Prowse, Marshfield; 2, .. Ings, Pownall.

Boar, 1 year and under 2.--1, Peter Brodie, York.

Boar, over six months and under 1 year—1, G. W. Woods. Haxzelbrook.

Boar, under 6 months—1, G. W. Woods, Hazelbrook; 2, Peter Brodie, York; 3, Samuel C. Lane, Pownal.

Sow, 2 years and over, having reared a litter, spring or summer, 1914.—1, Peter Brodie; 2, George W. Woods.

Sow, 1 year old and under 2, having reared a litter, spring or summer, 1915.—1, Peter Brodie; 2, Geo. W. Woods.

Sow, six months and under one year.—1,George W. Woods.

Sow, under six months—1, 3 and 4, Peter Brodie; 2, George W. Woods.

Pair of pigs, 3 months old and under 6 months, barrows excluded—1, Peter Brodie; 2, George W. Woods; 3, Samuel C. Lane.

Breeding sow with litter of not less than five pigs—1, and 3, George W.

THE HORSE

Fitting Horses for the Show Ring.

As the fair season is now on the subject of show horses and their preparation is appropriate and ought to be interesting to horse breeders generally, whether they are exhibitors this season or not.

The very first consideration in the line of preparing any animal for showing is to see that its health is as near perfect as possible. No possible good, but rather harm, will come from an attempt to fatten a horse or colt unless it is in really good vigorous health to start with. But back of even this important question of health is the primarily and still more essential matter of having a subject that with proper care and fitting can be made into a real show animal. Many breeders learn this lesson very slowly and grudgingly. They either make a mistake in selecting their animal or what is more likely they over-estimate the merits of some beast of their own breeding and are unable to see its defects even when perhaps repeatedly turned down by the judges.

Feeding for Show.

Assuming that you have procured a suitable horse or colt for the show ring and the animal is in good vigorous health, with no irregularly in his digestive organs nor fever in his legs, you should gradually increase his daily ration, keeping always in mind the necessity of having him respond from day to day to the more generous feeding. Scarcely any two animals are alike in their capacity to dispose of liberal rations, and this makes it practically impossible to prescribe a diet suitable for all. Some horses will eat and seemingly digest twice the amount that other horses can. It is always possible for horses to clean out their manger regularly and yet not be thriving. The groom or caretaker must watch closely the effect of an increased ration on the horse's general appearance and call a halt on the first symptoms of indigestion.

While some experienced and highly successful exhibitors pin their faith to simple oats and bran, others, including myself, prefer one daily feed of steamed oats or barley mixed with bran and chopped hay and with a handful of oil meal or flaxseed added to the mash. Quicker results will be got generally from this ration than dry aots and bran all the time. It is not, however, recommended to feed cooked feed oftener than once a day and for the other two feeds whole oats or bruised oats, but in no case finely ground oats, mixed with bran and chopped hay and very slightly moistened with water or preferably molasses water, but not sloppy. As an indication of quality three to five quarts each feed are suggested, but this must be left largely to the discretion of the caretaker.

Use No Drugs

It is not advisable to use drugs or "dope" of any kind. They are not necessary if the horse is healthy, and are usually more or less harmful. See that the animals get plenty of exercise daily and all the water he will drink, but never until at least two hours after eating.

Accustom the colt to walk smartly in a straight line with head well carried, to trot squarely, but not too fast, and, what is equally important, to stand like a soldier on parade. Some horses always seem awkward when standing and this gives the judge a poor impression.

The show horse must, of course, be regularly and thoroughly groomed; his coat ought to shine with lustre and have every hair in its proper place. Perfect health and show yard bloom are manifested by the high spirits, the bright intelligent eye and the shining coat.

The mechanics of draft and popular opinion alike demand absolutely straight front action and tolerably close action in any kind of a horse. The intending exhibitor should, therefore ,see that his colt neither paddles nor straddles. These faults, if not very pronounced, can be helped partly by a skilful blacksmith, but nature after all is the main arbiter, and guide, so it is the part of wisdom to try and breed the kind that go straight naturally. A light shoe without any heel is preferable to a heavy shoe with bevelled edge and prominent heel in the case of a paddling horse. The heavy shoe intensifies the defect.

The chief benefit which an exhibitor gets in the show ring is experience. If he keeps his eyes open and silently learns the inevitable lesson—accepts the judges' verdict as just (and it usually is)—and puts the result of his observations into practice with a determination to succeed, he is bound to come to the front some day both as a breeder and exhibitor.

Pricks in Shoeing.

What takes place in the foot when a horse is pricked in shoeing, or is stabbed by a gathered nail, depends a good deal on the exact seat and extent of the mischief. There are variations and degrees in almost every disease and accident to which horses are liable, and punctured wounds of the foot are no exception Direct puncture ic not very common, since the farrier who has any experience at once recognizes that from one of several causes the nail has gone wrong by the difference in the "feel" of the driving, and promptly withdraws it. Mischief rarely follows if the nail is left out, but matters may form if, to conceal the mishap, a second nail is driven to fill the hole. "Binging" nails are the most common source of injury, and, though popularly called "pricks," they are not really so, but consist of nails driven so close to the sensitive foot structure as to press upon it, or to do so after a few days when the shoe happens to shift. This kind of injury may not become apparent for a week or more after shoeing, and is especially liable to occur in thin, weak feet. Then the first mischief is irritation arising from pressure, local inflammation and the formation of pus. Much the same thing takes place when the sensitive foot is directly punctured, either when the nail is driven in shoeing or picked up, except that lameness is generally at once apparent. and a "gathered" nail may penetrate important structure of the posterior part of the foot, or even severely damage the bone. A punctured wound of the foot would not be anything more serious than a punctured wound of any other part except for the peculiarity of its structure, and its being cased in horn.

Death, although possible, is not by any means the inevitable result of neglected prick. When a fatal issue results, either tetanus (locked-jaw) or blood poisoning is the most common cause. The more common sequel is the establishment of sinus, a wound of the foot popularly known as quittor —cases that sometimes prove so obstinate that an early fatal termination would have been a real boon to all concerned. What takes place is that the matter formed in the foot has no outlet or "vest," and unless this is provided promptly by opening the hole, or making provision for drainage through a dependentorifice, the pus burrows among the foot structures, causes separation between the laminae, forms sinuses or "pipes" and finally breaks out at the coronett, or "between hair and hoof," the opening exuding a thin, unhealthy-looking discharge, and displaying no disposition to heal. When the nail or stub causing the mischief has been found, its course should be followed with the knife and free exit given to pus. The foot should then be poulticed, and this should be applied until the surface is smooth, dry and not at all tender. The shoe may then be applied, nails being left out of the vicinity, and cover, without pressure, provided until the horn has grown again. A leather sole with a packing of tar and tow is usually put on for a few weeks after a bad prick. Cases in which there is persistent lameness are sometimes due to severe damage to the pedal

bone, and the existence of a dead scale, acting as a foreign body and a source of irritation.—Veteran.

How Colds are Contracted.

The popular idea is that colds and the bronchial and pulmonary troubles that follow in their train invariably result from exposure to cold, wet, and inclement weather. In some cases they may arise from these causes, but the majority are due to causes exactly the reverse, and more colds are contracted from breathing a close, impure atmosphere than from being exposed to inclement weather in the open. A horse used to a warm stable and clothing, and perhaps newly shorn of its coat, seems to take no harm when turned out in cold weather, provided that it is well fed, while the same animal, brought from apparently uncomfortable conditions outside, exposed to wet and every wind that blows, and placed in a stable with other horses, almost certainly develops a bad cold and cough. Colts, when first brought under cover, especially in a stable that has other occupants, are pretty sure to cough and run at the nose, and they often require most careful nursing to avoid pulmonary complications and permanent affection of the wind. In bringing colts in for breaking purposes, it is a bad plan to put them in a stable with other horses. They are pretty sure to go wrong, and this, of course, interferes with their training. Theq should be put in a shed or roomy box stall that is well ventilated, and gradually accustomed to the change from a life of freedom in the open air where there is room to breathe as well as to move.

Sore Shoulders of Horses.

In the rush of field work much inconvenience and delay to the farmer, and excruciating pain to horses, may be prevented by care of the necks and shoulders. An improperly fitted or lumpy collar often causes a bruise, which later breaks into a running sore. A hard core or kernel is formed, which must be removed before this sore will heal. Often young or excitable horses will bruise themselves, even when supplied with well-fitting collars, by jerking, jumping, or uneven pulling. Some horses seem prone to collar sores, and must be carefully watched to avoid this troublesome injury. To prevent is more easy than to cure. Harden the neck and shoulders by bathing several times a week with salt water or vinegar in salt water. A little alum may be added. As a substitute for the old oak-bark solution, try tannic acid dissolved in glycerine. This toughens the skin by tanning it.

When a sore begins to appear which is usually characterized by a slight swelling, very warm and painful, do not work the animal for a day or two, if possible. If the horse cannot be spared, make a well-fitting felt pad, with the centre cut out, and place this over the injury. Healing powders or ointments, such as zinc oxide, boric acid, sulphur and lard, or carbolated vaseline may be used. If a watery serum runs from the sore, equal parts of tannic acid and powdered alum will prove efficacious. Severe caustics, such as blue vitroil, and the like, very often make the condition worse. Only soothing medicines should be used, allowing Nature full sway. If the shoulder becomes covered with sores, it is because they are contagious, the germs being found in the pus. A good blood tonic is often needed, and in bad cases the services of a competent veterinarian.—The Country Gentleman.

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Gombault's Caustic Balsam will give you immediate *Relief.* A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that."—Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

POULTRY

The Influence of Soil and Climate.

It is ofter imagined that the reason why poultry-keepers of other lands have always been so successful is because they are more favorably situated than we are as regards soil and climate. When it is asked why we have to import such huge quantities of eggs from abroad we are told that it is because fowls of other lands are more prolific, the result of their living under more favorable circumstances. Never was there a greater mistake. To say that our climate is responsible for the importation of such vast quantities of eggs and poultry is altogether wide of the mark, and will not bear close examination. It is just as easy to produce eggs in England as it is in Italy, for instance, or table fowls in Scotland as it is in France.

England's Premier Position

For generations and generations past England has held the premier position in the breeding of high-class stocks of all kinds. The skill and experience of our breeders have, of course, played an important part in maintaining the high standard of excellence, while the somewhat cramped conditions under which our people have had to work, and the consequent rigid selection of the breeding stock, have likewise exerted an influence. At the same time, had the conditions been unfavorable, or at any rate as unfavorable as many would have us believe, this high standard of excellence could not possibly have been maintained.

Climatic Conditions Abroad.

This applies to poultry in the same way as it does to larger stock. We have only to examine the conditions in the countries from whence we have been in the habit of importing our huge supplies of eggs to realize that we are more favorably situatied than they are. In Russia and the Netherlands the extremes of temperature are far greater than in the United Kingdom. In France, Italy and Austria-Hungary the winters are far colder, and the summers far hotter than they are with us, In the United States, one of the most successful poultry-keeping countries in the world, the climatic conditions are not nearly so favorable. As a matter of fact, we are most fortunately situated, and we cannot fairly blame our climate for our lack of success in the past. It is quite wrong to suppose that very hot summers are advantageous. Those who have travelled in the States or in many countries of Europe during the summer months will bear me out in this, for they must realize that scorched pastures and dried-up streams cannot possibly be beneficial. There is no doubt but that one of the reasons if not the main reason, why fowls in Southern Europe are so small and of such poor edible qualities is due to the intense heat of the summers. The less extreme the temperature of both summer and winter, the better it is for stock of every kind.

The Question of Soil

Soil also plays an important part in the health and prolificacy of fowls. When selecting a breed for a certain locality or for a certain purpose, the nature of the soil should always be taken into consideration. This is proved by the fact that if a breed of fowls is exported, say, to Australia, frequently it changes in many of its chief characteristics. Even in the different countries of Europe this is the case. Examples could be given were it necessary to do so, but probably nineteen out of every twenty poultry-keepers have observed this for themselves, without perhaps divining the cause. As a general rule, it may be accepted that white-fleshed fowls thrive upon a light soil, that those with grey flesh and legs do best upon a medium soil, while those with yellow legs and flesh thrive anywhere, even upon a heavy clay.

The Non-sitters

So far as number and size of eggs are concerned, the non-sitters are our best fowls. These are small, active breeds usually very hardy, rapid growers, and poor in their edible qualities. They are mostly spring and summer layers, although when they are hatched at the right time of year they may be depended upon to produce a certain number of eggs during the winter months. They cannot, however, compare with the general-purpose varieties in this respect. Without exception they all produce white-shelled eggs. The following are the conditions best suited to them:

Soil.	Breeds recommended.
Clay	—White, brown or buff Leghorn, Ancona, Redcap.
Medium.	—Black Minorca, Andalusian, Houdan.
Gravel	—Any non-sitting variety.

The General-Purpose Breeds

These are the birds which combine both egg-producing and edible qualities. They are more prolific than the table varieties ,although their meat properties are not quite so good, while they are better on the table than the non-sitters, although they do not produce so many eggs. The hens are quiet sitters and reliable mothers; the chickens grow fairly quickly; the cockerels make capital table birds. General-purpose fowls are the best winter layers we have. They all without exception produce tinted-shelled eggs. The following are the conditions under which the general-purpose breeds thrive best:

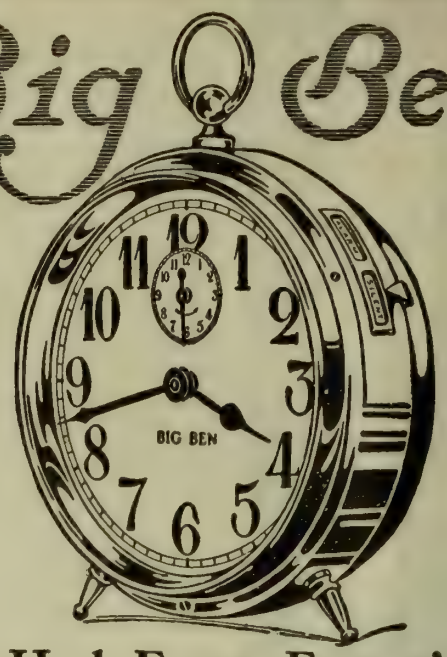
Soil.	Breeds recommended.
Clay.	—Plymouth Rock, Wyandotte, Light Brahma.
Medium.	—Wyandotte, Plymouth Rock. Langshan, Orpington.
Gravel	—Any of the above breeds.

The Table Breeds

These birds excel in their meat or flesh-producing properties. They are generally large, with a deep and broad body, a perfectly straight and long keel, carrying a large amount of white meat upon the breast and wings. Their bones should be soft. Rapid development and readiness to fatten are also important features. The following are the conditions under which the respective breeds thrive most satisfactorily:

Soil.	Breeds recommended.
Clay	—No table variety thrives well on clay soil.
Medium.	—Faverolles, Indian Game, Sussex.
Gravel	—Dorking, Game, Sussex. —English Exchange.

Big Ben



He's Had Farm Experience

On thousands of farms, Big Ben has been the clock of all work—ringing up the people who must get out early, and telling the right time of day to those who stay 'round the house.

Big Ben works 24 hours at a stretch—puts in overtime without extra pay, and never botches up a job.

He's husky, deep-voiced and strong. His call is clear—his bold numerals show plainly in the dim light.

If your dealer hasn't him, a money order addressed to his makers, *Westclox*, La Salle, Illinois, will bring him postpaid. $2.50 in the States—in Canada, $3.00.

A Poultry Yard Vice.

For some reason or other egg eating is particularly prevalent during the present season. Why this is so, I do not know. But the fact remains that in many yards great trouble and annoyance are being experienced. Fowls which are kept in confinement are always more prone to this complaint than are those enjoying a free range. As a matter of fact, when poultry have their liberty they very rarely contract the habit of egg eating. This proves pretty conclusively, I think, that one of the chief causes of the trouble is idleness, since fowls at freedom are so busily occupied in searching for worms, grubs, seeds, etc., that they have no time and no inclination to eat their eggs. There are, however, other causes beside lack of occupation to account for the prevalence of this complaint.

Some Causes of Egg Eating.

One of the worst features of egg eating is that it is so difficult to discover and often it is prevalent in a poultry yard for quite a long time before a hen is actually caught in the act. As it is, it is generally found out merely by accident, by discovering a hen engaged in the practice, since what adds considerably to the difficulty is that shell as well as contents is consumed, thus leaving no trace. When laying hens are receiving an insufficient supply of shell-forming material they frequently commence pecking at the eggs in order to satisfy their needs. Lack of shell-forming material in the diet generally results in one of two things, either the hens eat the egg, or else soft-shelled eggs are produced, one of which is as bad as the other. It may surprise some to learn that in one hundred eggs of ordinary size, there are 22 oz. of pure lime. There is on better way of providing this necessary lime than by supplying the birds liberally with broken oyster shell, which can generally be obtained for next to nothing. Excellent samples of specially broken shells can be secured at a very low figure. When too few nest-boxes are provided in the sleeping quarters the hens are forced to lay on the ground and the presence of eggs lying about is an encouragement to egg eating. There should always be provided at least one nest for every three hens, while one box for every two is all the better.

The Need for Employment

Arrangements should be made to provide fowls that are confined in runs with some means of occupation and amusement since, as I have already mentioned, idleness is a common cause of this complain. When there is a scratching shed attached to the house —and for many reasons such a plan is advisable—the floor should be littered with straw or chaff, and the grain scattered there among. This provides exercise and occupation for several hours of the day. A mangel or cabbage should be suspended from the roof to within a foot or so of the ground; in fact, just out of the birds' reach, which greatly assists in keeping them busily engaged. A piece of meat buried a few inches below the ground decays quickly, and the maggots coming up to the surface provide both food and recreation for the fowls.

A Cure

Prevention is always infinitely better than cure, and the careful poultryman will see to it that the causes are removed. A plan that may be adopted, however, once the habit has got a hold is to blow an egg and refill with a mixture of cayenne pepper and mustard. This should be left in a prominent place on the floor of the scratching shed or in the roosting compartment. It will probably be pecked at by one or more of the fowls, and should this occur it is almost certain to be the last egg that is ever eaten.—Expert.

Three "Made-in-Canada" Favorites

NITRO CLUB---REMINGTON---NEW CLUB

NITRO CLUB—a steel-lined "Speed Shell" that *gets more birds.* Steel lining permits higher compression—produces more power—insures straight line-drive. The swiftest shell on the market—an exclusive Remington-UMC product.

REMINGTON—The highest-grade, low-priced, Canadian-made Smokeless Shell. Loaded with Standard Smokeless Powders. Primed with No. 33 Primer. Moderate priced—but Remington-UMC quality.

NEW CLUB—Every hunter knows the "Yellow Fellow". For 50 years, the leading black-powder shell. As a hard-hitting, all-round black field shell, NEW CLUB has won world-wide fame.

Try these shells on your next trip. You'll gain new respect for "Made in Canada" shells.

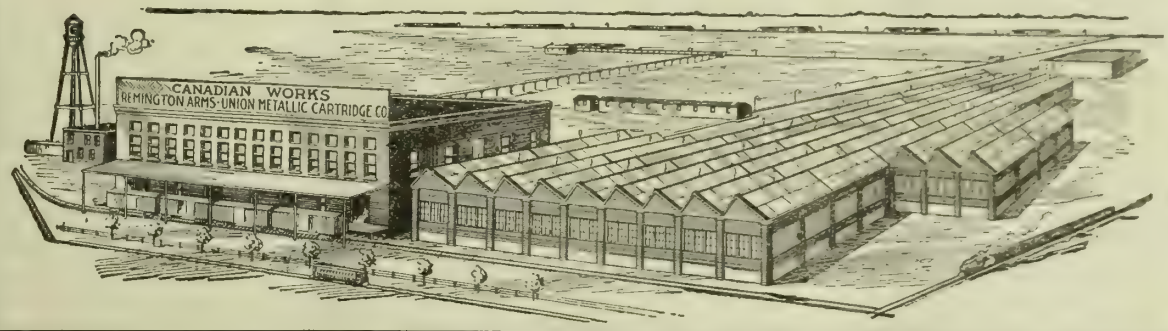
London, Eng. WINDSOR, ONT. New York, U.S.A, 15



Gathering and Sorting Eggs.

The best quality of poultry and eggs will command the highest prices in the right markets. The man or woman who keep fifty hens or more should constantly study how to put her products up in the best possible form. To do this eggs should be gathered frequently during the hot weather, as well as in the cold weather. When gathered they should be placed in a cool, dry cellar, where they should be graded ready for market. Even if just doing a small private trade it is well to do this as it establishes a good habit for future bigger business. This sorting should be done with great care. First all cracked and soiled eggs should be removed and used at home. We all know what a variety of colors and sizes we get in a basket of freshly gathered eggs from one breed. These different colors and sizes are better to be graded in order to have a uniformity of appearance. Of course all very small and abnormally large eggs should also stay at home.

First of all strive to produce a good article, then seek the market that appreciates the fine product, properly put up, and cater to the high standards og that market.

The Other Crosses

Adopted From an Italian Legend
By Anna Emmerson

Half past seven! They should have been home a half an hour ago." Mrs. Richards went to the front door and looked down the street. It was a misty night, the street lamps shining hazily through the fog. There was no sign of her sister-in-law, and her own grandchildren, so she shut the door with a sigh and went back to her place beside the open fire in the big comfortable sitting room.

Mrs. Richards was fifty. Once she had been a beautiful woman, and there were times, when she smiled, that the beauty of her youth still showed. Lately, however, she had seldom smiled, and she had come to wear a discontented expression most of the time. There was no real reason for the look, for if she could have realized it, her life had had its full share of the world's happiness and very little of the pain. But Mrs. Richards chose to consider herself a badly used woman, and she never lost the opportunity to impress the fact upon everyone with whom she came in contact.

Mr. Richars was a very good husband. At twenty he had started out to be a success in life, and so hard had he worked as a builder that a goodly sum was laid aside for the time when it would be needed. Lately Mr. Richards had been ill. Rheumatism had caught him in its clutches and forced him to give up active work. It made no difference to their mode of living, but Mrs. Richards found in his illness a new worry. The agony of having an idle man sitting about the house? It is true he never caused her any trouble, and he was particularly good at entertaining Ruth's children, who were always as obedient as could be. Still Mrs. Richards had to help him up and down stairs days when his rheumatism was very bad, make him remember to take his medicine on time, and in many small ways play the man of the house.

The Richards had two children, a son and a daughter. Most sons, Mrs. Richards always told herself, would have been willing to stay at home and follow their father's trade, but not so with her boy. He had gone off to the city, and everyone knows what city life can do for a young man. As it happened John was particularly successful and very much of a credit to his name. That much she couldn't give him any credit for, for wasn't he her own son Still, there he was in the city, like as not falling in love with some girl, and if he married whatever good would it do her|

And Ruth! Just when she had trained Ruth to be a help to her, she had gone and fallen madly in love with George Seaton. To think of her daughter doing anything so ridiculous! They were married, and George took her to live in the city. Mrs. Richards supposed he was a good husband. Ruth seemed to like him and the two little girls adored their papa. Then again, just when Ruth might have been some comfort to her, she had to go and get sick. Such a foolish thing for a strong, country-bred girl as Ruth! The doctors had decided that she had better be moved to a sanitarium, and there she was, making a six months' stay, surrounded by every luxury. That was just it, Mrs. Richards mused, Ruth off in a sanitarium and her poor mother slaving away to look after the two small children! Of course, George paid her for taking care of them, but they were such a bother and she was always worrying for fear something would happen to them.

Mrs. Richards looked at the clock. It was twenty minutes to eight now. Sre went again to the front door and looked down the street. Whq didn't Mary bring them home? It was damp and muddy, and the children had no business being out. Then, too, as they were not here, she would not be able to go over to Mrs. Johnson's. She really had not thought of going to Mrs. Johnson's until that very minute, but now she had something else to worry abou. It was a reception for the new preacher, a little informal gathering of some of the leaders of the church work. If Mary had only brought the children home then she could have gone. As it was she'd have to stay at home and put them to bed. Mary was such a queer woman, never saying a word, just went about her work trying to make things as cheerful as possible for everybody about her. Mr. Richards and the two little girls adored Mary, but personally, Mrs. Richards didn't like her. She was suspicionus of her silence.

Finally when eight o'clock came and Mary had not returned from the supper party where she had taken the children, Mrs. Richards went upstairs, donned her outdoor clothing and announced to her husband that she was going out.

Mrs. Johnson's parlors were full when she arrived, and after shaking hands with the new minister she found a place in the corner where she poured into the ears of two sympathetic listeners a long recital of her imagined troubles. Presently the minister gave a short address. She really hardly paid any attention until the end when he said something which was so appropriate to herself that she leaned forward to hear the better.

"And we must always do every little thing we can to help our neighbors," the preacher said. "We each of us have our cross to bear, and no one knows how heavy it is. Carry it cheerfully, and when you can, do something to help your neighbor carry his or her cross. You cannot tell your neighbor's burden—the heaviest crosses are sometimes the most cheerfully borne."

It was raining when the short meeting was over, and Mrs. Richards trudged home thinking how well the minister had summed up her own case. Many people in the village thought she was well off, but she sighed, "I don't believe there's a soul in the county who has such a heavy cross as I have to bear. If I could only change with someone! What have I done that Providence has served me so?"

When she got home she found that Mary and the children had only just come in. She scolded Mary for keeping them out so late, saying that she knew that they had taken cold. They sniffed a little as they were being put to bed, and she scolded anew, especially little Ruth. She did not know that the child was secretly grieving the loss of a battered, stuffed rabbit, that she herself had thrown away that morning. To Mrs. Richards the dirty, ragged but loved toy was so much rubbish for the furnace, and she had never given it another thought,—not even when she had seen the two little girls weeping silently as they had sat together on the top step of the porch. She switched off the electric light and went downstairs to close up the house for the night.

Mrs. Richards had been asleep some time when she awoke with the sense that someone was in the house. She called cautiously to her husband, but he did not waken.

"It's always the way," she said to herself. "it is always put on my shoulders."

She was not in the least afraid of any intruder, rather she was full of a determination that if anyone were attempting to rob her home, he should be caught and punished. She drew on a pair of slippers, and throwing a heavy dressing gown over her shoulders, went to the door.

The remarkable part of it all was that at the time Mrs. Richards was not the slightest bit astonished at what she found. When she looked over the banisters of the big square hall she saw that a light burned in the sitting room. She went down stairs and in through the open door. The sitting room had changed. It was larger much larger, and there was no furniture anywhere around. As she looked about her she saw that on every wall hung crosses of every size—some big, some small, some beautifully carved, others roughly nailed together. She noticed that there was hardly a square inch on the wall to be seen between them. From the far end of the room a young man with short curly hair and a shining white robe stood and looked at her.

"Well," Mrs. Richard said in amazement, "what's all this?"

"Good evening," said the angel. "You said tonight that you wished to change. I have come to offer it to you."

"I said I wished to change?" she queried.

"Yes, and I happened to be listening."

"A change of what?" Mrs. Richards asked.

"Of crosses," the angel said, softly. "I have brought you the crosses borne by everyone in the village, and you may take your pick."

"In exchange for the one I now carry " she asked meekly.

"Yes, you may take them all down and try to find one which you would like to carry."

Mrs. Richards looked all about. She wouldn't take the smallest of the crosses—she was willing to bear her share of the world's troubles—but it did not seem to her that she should have to carry all that had rested on her shoulders up to the present time.

After a minute spent in selection, Mrs. Richards took down what seemed to be a medium-sized cross. It really wasn't heavy, not the first minute or two, but after a while she found that there were splinters in the wood, and they dug tormentingly into her hands, and it hurt her shoulder.

"No, I don't want that," she said decidedly, as she hung it back. "Whose is that?"

"Your husbands."

"My husband's| What has he to bear?"

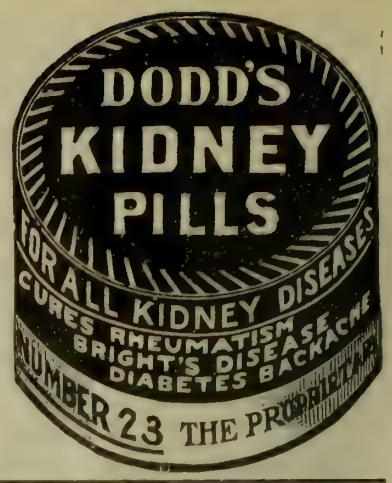
The angel drew a book from beneath his robe and opened it:

"Pain, ill health, and worst of all, an unloving, nagging wife," he read.

Mrs. Richards looked at him speechless. She said nothing, however, for something in the angel's look made her silent.

Next she took down another cross, a much smaller one this time, and the handle of it was worn smooth, as though it had been carried a long time. Mrs. Richards almost dropped the cross from her shoulders, it was so heavy.

"Heavens," she exclaimed, "I'll put



WOMAN SUFFERED TEN YEARS

From Female Ills—Restored to Health by Lydia E. Pinkham's Vegetable Compound.

Belleville, N.S., Canada.—"I doctored for ten years for female troubles and did not get well. I read in the paper about Lydia E. Pinkham's Vegetable Compound and decided to try it. I write now to tell you that I am cured. You can publish my letter as a testimonial." — Mrs. SUVRINE BABINE, Belleville, Nova Scotia, Canada.

Another Woman Recovers.

Auburn, N. Y.—"I suffered from nervousness for ten years, and had such organic pains that sometimes I would lie in bed four days at a time, could not eat or sleep and did not want anyone to talk to me or bother me at all. Sometimes I would suffer for seven hours at a time. Different doctors did the best they could for me until four months ago I began giving Lydia E. Pinkham's Vegetable Compound a trial and now I am in good health."—Mrs. WILLIAM H. GILL, No. 15 Pleasant Street, Auburn, New York.

The above are only two of the thousands of grateful letters which are constantly being received by the Pinkham Medicine Company of Lynn, Mass., which show clearly what great things Lydia E. Pinkham's Vegetable Compound does for those who suffer from woman's ills.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

SOLD BY DEALERS EVERYWHERE

this one back, if you please. Whoever does that belong to, and what makes such a heavy cross seem so small?"

"That is Mary Richards', your sister-in-law's. It looks small because she does her best to make life happy for those about her. That cross is made up of years of sorrow, lost love, loneliness, cruel tongues, and the burdens that she has taken from other people's shoulders."

Mrs. Richards was silent for a moment. "Well, this one's small enough," she said, but she drew back her hand as quickly as she had put it out. The small cross had a large thorn in the handle of it, and her finger was bleeding from the prick.

"That cross belongs to your little granddaughter, Ruth Seaton. She has a sensitive, loving spirit, which is tortured by every unkind act."

Mrs. Richards had gone on to the next cross, but the wood was sticky, and uncomfortabel to hold.

"That cross belongs to your daughter. She has ill health, and a longing to be able to be with the ones she loves."

Mrs. Richards took down cross after cross, but each one of them was either too heavy, too rough, or in some way hopeless to handle. She came to know that the largest crosses were by no means the heaviest.

At last she found herself at the end of the room, underneath a huge cross which covered almost the entire wall. She had not noticed this cross before. and looked at it sharply. Suddenly she saw to her surprise that it was made of nothing but woven feathers, light and soft to the touch. She took it down and hardly felt it as it rested on her shoulders.

"I guess I'll take this one," she laughed in triumph. "It must be a mighty lucky person that doesn't have any more trouble than this one does. Thank you very much for this change. I'd like to know—"

"That is your own cross," the angel said, and vanished.

Interesting Reports From The New Brunswick Women's Institutes.

The Chocolate and Cummings Cove Branch of the Women's Institutes of New Brunswick was organized by Miss Winter and Miss Jonathan the evening of July 28, 1914, with a promise of eighteen members. The first Friday in the month was chosen as the night of meeting and the first session was held at the home of the president on the evening of August 7, where, owing to the disagreeable weather, only nine were able to join. The next night of meeting, in September, only 1 new member came in and in October seven were added to the list. Since that time our membership has steadily increased until now it totals thirtyone. We have been able to hold a meeting each month since the Institute was organized, and the attendance and interest have been good.

Our work for the year has been mainly patriotic. In September we had a sale at which we realized $18.00 for patriotic purposes; $15.00 of this was sent to Mrs. Bruce for the Hospital Ship Fund and the other $3.00 found its way to the treasurer of the Red Cross Society, to be used for hospital supplies.

On January 30th, a birthday party was given and the sum of $44.00 was taken. Of this amount $5.00 was sent to Lady Tilley towards the endowment of a hospital bed at the front for New Brunswick; $9.00 was spent on the purchase of a suitable gift for the young men who went with the 26th Battalion from this community. We sent $5.00 more to the Red Cross Society for hospital supplies, and the remainder was used to buy material to be made up into socks and hospital shirts. Forty-five pairs were knitted and 23 hospital shirts made, and one quilt made by our members and all forwarded at different times and to differe tnplaces for use in Red Cross work.

In May, 50 "Allied for Right" buttons were sold, the proceeds of which, $5.25, together with $5.00 from the Institutes funds were forwarded to Miss Winter to be used towards the purchase of a motor ambulance.

In June a sale was held, the proceeds of which, $12.00, is being used to make some much needed repairs in the cemeteries of Chocolate Grove and Cummings Cove. We pay $5.00 per year for the use of the hall in which we hold our meetings and 25c a night to the janitor insures having a warm, well lighted room. The latter sum is raised by a tax of 2c per night on each member present. This always gives us a small surplus which is placed in the general Institute funds.

We wish to thank the Department for the grant of $5.00, also for books forwarded to us through Miss Winter. We hope these may be the beginning of a library which will be of great benefit to our community.

The programmes are made out by a committee one month in advance and each seems willing to do her part to make the meetings pleasant and profitable.

The outlook for next year is encouraging. We fell sure that all our old members will come in again and we have the promise of new ones.

We feel that the success of our Institute is due mainly to the fact that a spirit of harmony exists among the members, each one being willing to abide by the decision of the majority. While we may not always be of exactly the same mind, still we work as one, realiging the sound truth of the old saying, "United we stand, divided we fall."

This helpful report was forwarded to the department by Mrs. Onslo L. Haney, secretary-treasurer of the Chocolate and Cummings Cove Institute.

Grand Harbor Women's Institute.

An interesting report comes from Miss Hazel M. Newton, secretary-treasurer of the Grand Harbor, (Crand Manan,) Women's Institute.

In the year which is past, it is gratifying to note that our Branch has increased in membership. At the close of last year our report showed a membership of 33. Now we have enrolled 42 and one of our energetic members has brought in four new names for the coming year.

In other respects as well our branch can report progress. We are now the proud possessors of a library of 61 volumes. A number of members donated a volume each, and most generous contributions were received from Mrs. Gregg Beckett, Calais, and Miss Theo. Stevens, St. Stephen.

A committee appointed by the Institute to devise some means of raising money faithfully in preparing a drama which was presented to the public and greatly increased our bank account.

Several demonstrations and addresses have been given by outside parties. Namely—Dr. Johnson, an address on "Bad Air"; Miss Alma Benson, demonstrating "Bed Making for the Sick"; and Miss Jonah, from the department, gave demonstrations in cake and candy making. All of these were very interesting and much appreciated.

We had a large attendance at our social in February and it was considered a great success. Mr. Gosline delivered an excellent address on: "What the Women's Institutes can do for the Moral Uplift of the Community."

The following members have demonstrated or given samples of cookery: Mrs. G. L. Dakin, Mrs. George Lawrence, Mrs. Scott D. Guptill, Mrs. Wesley Newton, Mrs. D. H. Daggett, Mrs.

It's good for little girls, too

Everybody—young and old—loves the rich, delicious flavor of

EDWARDSBURG "Crown Brand" CORN SYRUP

It is a daily treat—the perfect sweet. Just what the children should have on Bread—costs far less than butter or preserves. Delicious with Hot Biscuits, and Batter Cakes. Gives a new delight to Baked Apples, Blanc-Mange and Puddings. Makes the best Candy you ever tasted. 3

"LILY WHITE" is a pure white Corn Syrup, not as pronounced in flavor as "Crown Brand". *Your Grocer has both Brands, in 2, 5, 10 and 20 pound tins—or can easily get them for you.*

DON'T STAY FAT

To prove that ADIPO, a pleasant, harmless Obesity Treatment, will take fat off any part of the body, we send a

50c. BOX FREE

to anyone who is too fat. Adipo requires no exercising or dieting, nor does it interfere with your usual habits. Rheumatism, Asthma, Kidney and Heart troubles that so often come with Obesity, improve as you reduce. Let us prove it at our expense.

Write to-day for the **FREE 50c. BOX** and illustrated book.

And enclose 10 cents to help pay distribution expenses.
Address: ADIPO CO., 2332 Ashland Bld'g, New York.

C. A. Newton, Mrs. Wm. Cronk, Mrs. A. O'Neill, Mrs. Neill Guptill, Mrs. B. F. Johnson, Mrs. Frank Lakeman, Miss Grace Ingalls, Mrs. I. L. Newton.

In this time of national distress our members have striven to aid, by contributions of clothing, etc., to the needy Belgians, as well as industriously working to supply comforts for our own soldiers. I might here state the number of articles which have been sent: 1 quilt, 1 dozen nightshirts, 1 dozen belts, 58 pairs of socks, 3 cases of clothing. The quilt which I mentioned is to go to one of the New Brunswick beds at the front. We greatly appreciated the donation of socks from Mrs. Cossaboom as well as from others not members of the branch.

Our ranks have been broken by death during the year and one of our young homemakers has been taken from our midst; this sad event prevented the Button Campaign which we had planned on organizing. However, Miss Winters sent us 200 "Allied for Right" buttons and all except 20 of these have been disposed of, giving us $21.00. To this we added $29.00 from the funds, making a total of $50 sent to Miss Winter for the motor ambulance fund.

Lessons in Life from Weeds

Written by Miss Idello Robinson, and read at a meeting of the Newtown and Smith's Creek Women's Institute.

Are there lessons in life to be learned from these simple but harmful things known as "weeds"? We are taught to define weeds as "plants growing out of place." Have we any little things in our lives that should have no place there? Have we weeds in our lives?

For our comparison let us choose on the one side that which will appeal to men and women alike,—the plot of ground composed of the vegetable and flower garden combined,—and on the other side the life which God has given us; the life in which we must have our work and our pleasures combined. Surely the vegetable garden from which we expect a part of our food may be compared with the business or more serious part of our lives. Surely, too, may we compare the flower garden with its beautiful and wonderfully scented flowers,, with the pleasure of our lives.

We have these then for our comparison. Let us start at the beginning and see how nicely the comparison will work out.

Early in the spring we look upon our plot of ground and we see a patch of bare brown earth. From that glance we little know the vitality hidden there, ready to give wonderful growth to the small miniature plantlets hidden in the apparently dry and lifeless seeds, we will later scatter there. Neither can we tell from looking at that plot of earth the great number of small seeds scattered there, by various agencies from some neglected plot of weeds of the year before. These weed-seeds are surely there in greater or lesser numbers and ready to spring itno growing life and fill our garden with weeds.

We look at a very young child and as with the plot of earth, little can we tell the possibilities before that child. The strength of character, the capacfor study, the great and good things which may be accomplished by that child, whose life is just starting, are all hidden from us. Neither can we tell from looking upon that child what weaknesses may be scattered there that may later cause that life to be marred by the yielding to temptations. As in the plot of soil we have no idea of the weed-seeds scattered there, neither can we tell the number of small tendencies within that child for wrong-doing—tendencies that may be weed-seeds scattered there by example of others or by sins committed by its fore-fathers.

We plough and harrow our garden plot and in every way we prepare it to receive good seed from our hands. We improve its looks, we add to its strength, and we destroy as many as possible of the little weeds as they make their first start. We choose those seeds that will bring forth plants either useful or ornamental and we plant those seeds with system and care.

The life of a child is similar indeed. Children are trained in various ways as soon as they can understand the difference between right and wrong. They are punished sometimes when they may feel the punishment unnecessary and hard to bear.

However, in doing that the parents are trying to overcome the little tendencies to do those things that are wrong and to lay the foundation for a strong, wholesome character. They are killing the small miniature habits, starting growth from the weed-seeds already in the child's life, and they are sowing the seeds of good habits in the hope that they may take root.

In our garden plot not all the weed seeds or weeds will be destroyed by our ploughing, harrowing and working of the soil. Some may be, for the time, hidden and escape—others may have a deep root system firmly established and persistent work is required. It may be, too, that another's garden plot near ours have been neglected an dsome early maturing plants have produced seeds that may be carried to our garden, where if neglected they may take root. So throughout the growing season we must be persistent in destroying the weeds in our garden, an din giving all encouragement to theh growth and development of our vegetables and flowers.

So it is in our lives, the training at home and later in the school will do much toward training the child to do right and to avoid wrong. However, some of theses little weaknesses may not come to light until later. The early training means much, but life in developing is under changing circumstances. New temptations may arise from time to time even as weed-seeds from another's neglected garden. These must be met and overcome if that life is to bring forth the right fruits, and the beautiful pleasures of living.

We have been taking for granted that our garden and our life have been kept free from weeds. Let us suppose on the other hand that both have been neglected, what have we as a result

In our neglected garden, improperly plowed and ahrrowed in the spring, seeds chosen at random and planted withotu care or system, neglected work of weeding and encouragement throughout the growing season and we have—What? A tangled mass of weeds and a few stunted vegetables and flowering plants. The weeds have grown without hindrance, they have sapped the fertility and moisture from the soil, thus robbing the useful palnts and crowding them out. The good has been crowded out and the weeds are producing seeds to be a pest to next year's crop. Have we a pleasant picture?

In a neglected life of one improperly trained in youth, where little attention has been given to the early laying of the foundation for a good character, where little has been done to check the tendencies for doing wrong, and that little done without careful thought what have we? A life stunted in every way; the possibilities for great good have been hidden or destroyed, and crowded out by the yielding to temptations, and an example has been made to sow weed-seeds upon some other life developing near at hand or awaiting future development. Is this a pleasant picture?

As we look out upon our garden at this closing season of the year, do we find it free from weeds? Have we given it every possible care and attention? Have we brought our vegetables and flowers to maturity as best we could Are there any weeds there which may by growth of root, or by scattering of seeds, render the possibilities of next year's crop less likely, or can we look out with pride and feel that we have done our best?

We are all developing now. Will it be possible for us as we near the closing of our lives to look back and see that the good has been developed? Will we be able to know that we have conquered our weaknesses and overcome temptations for wrong-doing before they reach maturity? Will we be able to feel that we are leaving an example that will help others in their development?

As we look at our lives just as they are today, can we feel that we are doing all we can to resist our weaknesses? Can we feel that we are setting a good example and doing our duty toward younger ones around us? Let us ask ourselves this question: "Have we weeds in our lives?"

GRAY HAIR

Dr. Tremain's Natural Hair Restorative, used as directed, is guaranteed to restore gray hair to its natural color or money refunded. Positively not a dye and non-injurious Price $1.00, post-paid. Write Tremain Supply Co., Dept. 31 Toronto, Ont.

Best for Baby *Best for You*

Stains which bother in the laundry are of three kinds, i.e., those caused by vegetable growth, those from actual chemical compounds and those caused by a deposit of small, solid particles.

Mildew is perhaps the strain which puzzles the housekeeper the most. It is the most common type caused by vegetable growth. When this stain is examined under the microscope, one can see a network of tiny tendrils which cannot be seen without the aid of the microscope. On the ends of some of these tendrils can be seen small cup-shaped organs which hold small seeds or spores, which scatter over the cloth and start new plants. This is the way the mildew stains spread all through a garment. These little tendrils will, if given time, find their way through many layers of the material.

Oxygen will destroy the mildew plant, but it will thrive in a damp, warm place. To remove mildew from a garment, first give it a thorough airing and then place in boiling water; the character of the stain in changed and it is now a chemical compound, for the mold has produced a dye. A bleaching process has to be resorted to now to remove the stain. Soak the garment in equal quantities of hot water until the stain disappears; thoroughly rinse in three waters; then rinse in water to which a little ammonia has been added.

Woods; 2, Peter Brodie.

Sweepstake boar—1, Peter Brodie.

Sweepstake sow—1, Peter Brodie.

Pen, consisting of 1 boar and three females, any age—1, Peter Brodie; 2, George W. Woods.

CLASS 43—Yorkshires

Boar, 2 years old and upwards—1, J. W. Callbeck & Sons, Summerside.

Boar, over six months and under 1 year—1, J. W. Callbeck & Sons.

Boar, under 6 months—1, George Crockett, York; 2, J. W. Callbeck & Sons; 3, Wallace Stead, Highfield.

Sow, 2 years and over, having reared a litter, spring or summer 1915. —1 and 2, J. W. Callbeck & Sons; 3, George Crockett, York.

Sow, 1 year old and under 2, having reared a litter, spring or summer 1915. —1 and 2, J. W. Callbeck & Sons; 3, George Crockett.

Sow, six months and under one year. 1 and 2, J. W. Callbeck & Sons.

Sow, under six months—1, 2 and 4, J. W. Callbeck & Sons; 3, George Crockett.

Pair of pigs, 3 months old and under 6 months, barrows excluded—1, 3 and 4, J. W. Callbeck & Sons; 2, George Crockett.

Breeding sow with litter of not less than five pigs—1, J. W. Callbeck & Sons; 2 and 3, George Crockett.

Sweepstake boar—1, J. W. Callbeck & Sons.

Sweepstake sow—1, J. W. Callbeck & Sons.

Pen, consisting of 1 boar and 3 sows. 1, J. W. Callbeck & Sons.

CLASS 44—Chester Whites

Boar, 2 years old and upwards—1, E. Wheatley & Co., City; 2, T. H. Prowse, Union Road

Boar, over six months and under 1 year—1, T. W. Prowse, Union Road.

Boar, under 6 months—1, Ramsey Auld, Covehead; 2, Henry McCallum, Dunstaffnage; 3, O. H. Boswall, Little York; 4, Wallace Stead, Highfield.

Sow, 2 years and over, having reared a litter, spring or summer 1915. —1, Wallace Wood, Alexandra; 2, Wallace Stead; 3, Gordon Wheatley; 4, T. W. Prowse.

Sow, 1 year old and under 2, having reared a litter, spring or summer 1915. —1, T. W. Prowse; 2, Wallace Wood.

Sow, 6 months and under 1 year—1, Wallace Stead.

Sow, under 6 months—1 and 4, Wallace Stead; 2 and 3, T. W. Prowse.

CLASS 46—Export Bacon Hogs

For the best pen of 2 pure bred hogs, most suitable for export bacon. The hogs in this section to be bred and owned by the exhibitor, and each pen entered must be of the same breed. Hogs to weigh not less than 160 lbs., and not more than 220 lbs., and to be judged in relation to length and even depth of side, width of back, size of shoulder and head, and well developed hams.—1 and 3, George Crockett; 2, J. W. Callbeck; 4, Wallace Stead, Highfield.

For the best pen of 2 hogs of any cross or grade, most suitable for export bacon. Hogs to weigh not less than 160 lbs., and not more than 220 lbs., and to be judged in relation to length and even depth of side, size of shoulder and head, and well developed hams.—1, Joseph Praught, Pownal; J. W. Callbeck & Sons, Summerside; 3, George Crockett, York; 4, Peter Brodie, York.

Messrs. Davis & Fraser, of the city of Halifax, offer special prizes for the two best finished hogs, any breed, not weighing over 125 lbs., when dressed. The two animals must be the property of one exhibitor. Hogs shown in any other class are eligible to compete for this prize. The principal points in judging will be nice, thick, plump ham, and the side suitable for English breakfast bacon—1, J. W. Callbeck & Sons; 2, George Crockett 3, Peter Brodie; 4, George W. Wood.

Grades

Pair of pigs, 3 months old and under 6 months, barrows excluded.—1, T. W Prowse; 2, Wallace Stead; 3, A. H. Boswall.

Breeding sow, with litter or not less than 5 pigs—1 and 3, T. W. Prowse; 2, Wallace Wood.

Sweepstake boar—1, Wallace Stead.

Sweepstake sow—1, Wallace Wood.

Pen, consisting of 1 boar and three females, any age—1, Wallace Stead.

CITY WATER SERVICE on the Farm

ALL THE CONVENIENCES OF A CITY HOME

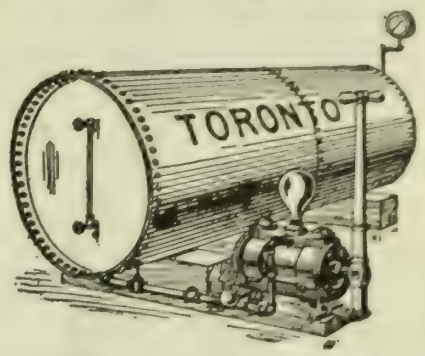
The farmer and his wife—just been to the city or town. Called on a friend or relative. Thirsty. Thirsty? Would you like a drink of water? Certainly. Turn on the tap and help yourself.

Going home, THE FARMER'S WIFE—How nice it would be if we were in town so that we could have those conveniences. No need. The farm is the best place on earth to live, and with a

Chapman Water System

you can make it an earthly paradise.

A cold, dark winter's night, just going to bed and have to go outside before retiring—the wind whistling through the cracks, chills to the bone—how nice would have been the toilet in the house.



Get that installment now.
To wait is to regret!

GUARANTEE—goes with every Monarch sold.

All in the

ENTERPRISE Steel

Monarch Range

THE Monarch is the "Range De Luxe"—the best you can possibly get. It is made right here in Eastern Canada, however, so that it is very reasonable in price.

Other stoves have some of these features—The Monarch has them all, with others that we cannot list here. You must see a Monarch to even partly appreciate it. When you have used one, you will agree that it's the finest range made.

Write for a free copy of the book we've published about the Monarch, and for the name of our representative in your neighborhood.

HAD CHOLERA INFANTUM.

Doctor Said He was In a Very Dangerous Condition.

Mothers cannot watch their children too closely for signs of cholera infantum as this disease carries off thousands of infants during the hot summer months.

Mrs. Geo. W. Garland, Prosser Brook, N.B., writes: "Last summer my boy Joe, then a year old, was taken sick with cholera infantum. He was so bad the waste matter from the bowels looked as if it had come from a broken boil. I sent word to the doctor who was at a neighbor's, about a mile distant, and he said my boy was in a very dangerous condition. He sent me some tablets which made the child vomit, and when he learned that they caused vomiting he sent me more tablets to stop it. In the meantime I had been giving Dr. Fowler's Extract of Wild Strawberry, which I continued using, and when the bottle was all used my baby was cured. I though it only fair to let you know about it."

Dr. Fowler's Extract of Wild Strawberry has been on the market for the past 70 years, and is known from one end of Canada to the other as a positive cure for all bowel complaints.

When you ask for "Dr. Fowler's" be sure you get what you ask for as there are many rank imitations on the market.

The genuine is manufactured by The T. Milburn Co., Limited, Toronto, Ont.

Price, 35 cents.

Give children the benefit of modern ideas in underwear

Don't put old-style uncomfortable bothersome underwear on them. Watson's Children's Union Suits are made expressly for little folks' comfort and convenience.

They are snug fitting, neat and comfortable. Made according to the Klosed Krotch idea that the grown-ups esteem so highly.

The fabric? Spring Needle Rib—uniform, elastic, smoothly finished, good for wear.
Fit the youngsters out with

WATSON'S Klosed-Krotch COMBINATIONS

We also make Waists, Vests, Drawers, Bloomers and a full line of Infants' Goods in all fabrics.
Ask your dealer.

Suffering Women! Before Giving Up Altogether, Write Me!!

Listen, Women! All the physicking in the world won't put you right. What you need is a purely local treatment like "Orange Lily" and if I am so confident about it as to send you ten days' treatment, absolutely FREE, you will, I am sure, be interested enough to follow what I want to tell you.

I think we are all agreed that a perfect understanding of women's ills and a thorough sympathy with such cases cannot be expected from men, however wise and learned. Only someone who has actually gone through the experience can fully realize the sufferings of hundreds of thousands of our women to-day.

My own case taught me that the ailments to which we are subject, and from which so many of the women of Canada suffer, can be conquered, surely and finally. I endured almost beyond belief for years, and contracted a particularly obstinate condition because I neglected attending to my trouble, yet "Orange Lily" got to work at once and put me permanently right in a very short time.

Dosing and drenching the system with violent drugs is worse than useless; in fact, often aggravates the trouble. "Orange Lily" has a perfect action because it works right at the seat of the malady, leaving other organs to continue their functions undisturbed. You apply "Orange Lily" yourself in the privacy of your own home. No more humiliating "examinations" by prying doctors. No more embarrassing questionings. You use "Orange Lily" for ten days, free, at my expense, and the treatment doesn't interfere with your daily work.

Write me to-day, now, before you leave this page. In matters like this, delays are sometimes dangerous. Let me send this helpful free treatment at once. Address: Mrs. Frances E. Currah, Windsor, Ont.

NERVOUS DYSPEPSIA

For 11 years—Completely Cured by Dr. Cassel's Tablets
The Famous All-British Medicine.

Pain and Wind so Bad it Nearly Choked Her.

Palpitation, Faintness, and Extreme Nervousness

Was Very Thin and Anaemic.

Now in Splendid Health Through

Dr. Cassel's Tablets.

Those here in Canada suffering from Digestive or Nerve Troubles who read this true story cannot fail to get new hope from its perusal. Mrs. Rogers, of 243, Whitehall-road, Bristol, England, had suffered from acute dyspepsia for eleven years, ordinary treatment had failed to do her any good, yet Dr. Cassell's Tablets cured her completely. Could more convincing proof of the value of this great British medicine be offered? Mrs. Rogers says:—"Dr. Cassell's Tablets have cured me of dyspepsia that nothing I tried could even relieve, and I feel so pleased and grateful that I want to tell every sufferer about this wonderful medicine.

"It is quite eleven years since I first began to be troubled with pains and wind after food, and all that time I was never quite free from dypepsia. Of course, I was better sometimes, a little better that is, but never for long. Frequently I had frightful attacks of pain in my chest, and wind in such quantities that it almost choked me. My heart would palpitate until I went quite faint. I was very nervous, too, so nervous, in fact, that my husband actually stopped the clock because I could not bear the ticking.

"The result of all this suffering was that I became quite thin and anaemic, and so weak that if I tried to do my housework I simply fainted. I had to pay to have it done for me. Latterly I

could not get about the house without support, and I used to turn the broom upside down and use it as a sort of crutch. At night, I always had peppermint by my bedside to relieve the wind.

"Of course, I had treatment, I even attended an institution, but I got no better. They always told me to have my teeth out, and that I did not want to do, but when I got Dr. Cassell's Tablets, what a change! They relieved me almost at once, and as I peresvered with them all my pain, wind, heartache and other troubles gradually disappeared, and now I am in splendid health. I can eat any kind of food and am stronger than I have been for years. Certainly, I shall never cease to praise Dr. Cassell's Tablets."

SO BAD COULD NOT WORK.

Is Now Perfectly Cured.

The value of Dr. Cassell's Tablets to all who have to earn a living is well seen in the following true story. The teller of this story, Mr. Mendham, of 21 Princess Road, Old Fletton, Peterborough, England, had long been too ill to work, but now he is in steady employment, made well and strong by Dr. Cassell's Tablets. He says:

"I am glad to be able to testify to the wonderful curative power of Dr. Cassell's Tablets. They cured me

when nothing else I tried would, and enabled me to keep steadily at work. I had suffered for years from dyspepsia, sleeplessness, and bad nervous attacks. I could do nothing while these attacks were on, and they were so frequent that I was as much away from work as at it. I was always more or less ill, always had severe pain after food, with volumes of wind, and a dizzy sensation that I could not shake off. Headaches, too, were frequent and severe, and sometimes I had shivering turns like ague. I tried all sorts of things and had endless medicine, but it was only when I got Dr. Cassell's Tablets that I got any real benefit. It was really wonderful how they cured me. I got sleep at nights, could eat without suffering, and now I am in splendid health."

LARGEST SALE IN BRITAIN

Popularity Now World-Wide.

The aboslute authenticity of the foregoing cases are guaranteed, and no testimonial is ever published by the Dr. Cassell's Co., without full personal inquiry as to its genuineness. Purchasers of Dr. Cassell's Tablets in this country may rest assured that they are getting a really reliable and tested remedy for nervous breakdown, Nerve Failure, Infantile Weakness, Neurasthenia, Sleeplessness, Anaemia, Kidney Trouble, Dyspepsia, Stomach Disorder, Wasting, Palpitation; and they are specially valuable for nursing mothers and girls apporaching womanhood. All druggists and storekeepers throughout the Dominion sell Dr. Cassell's Tablets at 50 cents. People in outlying districts should keep Dr. Cassell's Tablets by them in case of emergency. A free sample will be sent on receipt of 5 cents for mailing and packing, by the Sole Agents for Canada, H. F. Ritchie and Co., Ltd., 10, McCaul-street, Toronto, Ont.

Parasitic Diseases of Sheep.

Professor T. W. Cave, F.R.C.V.S., gave 'Some Veterinary Notes on Sheep" to the farmers assembled at the recent Sheep-Breeders' Conference at Wye, England, and alluded to what he described as 'something new in science." During the lambing season of 1914, a report was received at the college that a gentleman in East Kent was losing a considerable number of lambs which were born dead, and inquiry was suggested. As it was thought that it might be due to something in connection with the management of the ewes, his colleague, Mr. Garrad, visited the farm and made full inquiry. He was unable to discover that anything was wrong with the management, and the owner mentioned that he had opened a number of the lambs and found what he described as "spotted liver." Lambs were sent to the college. At this time sixty-four dead lambs had been produced by forty-eight Kent ewes, and eventually about 100 were lost. The first lamb arrived from the farm on March 6. It was well developed, and its lungs were found to be inflated, proving that it had at any rate breathed. The naval string was found to be perfectly fresh and unshrivelled, proving that the lamb had lived but a short period. The liver showed the presence of spots which resembled a diseased condition of the liver of other animals, both cattle and sheep, but of a greater age. It was a disease due to the presence in the liver of a special microbe known as the Bacillus necrosis. Whenever it grew in the tissue or organ it caused death of the surrounding tissue and the production of patches which were called areas of necrosis. It was at once seen that there was a considerable resemblance to the well-known necrosis of the liver and it was considered whether it could possibly be due to the same cause. He made inquiries in various parts of the country to know whether anything was known of such a thing happening in the unborn lamb. He searched through whatever literature was available, and could come across no evidence that such a thing had previously been recognized. The bacillus of necrosis was found in different situations in the domesticated animals, all of which appeared to be more or less susceptible to infection. It was distributed in soil, and especially in cultivated soil, and there they had the possibility of infection.

How Infection May Occur.

Natural infection might take place through the digestive organs and in this way some of the microbes might reach the liver. It was found in connection with poll evil and quitter, and in certain forms of ulceration of the intestines. Otherwise it might find its entrance through small wounds or abrasions. The same bacillus was found in connection with certain cases of foul in the foot in cattle, and in necrotic patches in the livers of both cattle and sheep and in calves and lambs as a form of navel-ill. In lambs affected with navel-ill abscesses were found in the liver, but in these the infection must have taken place after birth. In the cases under investigation the great point was that these lambs were evidently diseased for a considerable time before birth; they were stillborn in consequence of the diseased condition of the liver. It seemed that further investigation was desirable. The owner sent altogether ten lambs, and two of these came from another part. Out of the ten eight were found to be suffering from the bacillus of the liver; the other two were not affected, and that was the case also with the two from another farm. Some of the eight had never breathed, others had lived one or two days, but one had lived about a fortnight. In that case there was a rather peculiar condition. There were the same large patches on the liver, but there was also a very large number of smaller patches which suggested the possibility that the larger areas were caused before the birth of the lamb, and that then a second invasion took place from the umbilical vein. It was determined positively by microscopical examination that the well-known bacillus was present in the diseased patches of the liver, and cultures were prepared and the microbe grew in the characteristic manner. A test was also made by the inoculation of a ribbit, and as a result of all the investigations it was concluded that the loss of about 100 lambs, most of them still-born, was due to the presence of the bacillus in the liver, but no evidence could be obtained as to the origin of the disease. The origin in the case of the adult animal was perfectly simple—it in all probability invaded the body through the alimentary canal. In poll evil they would expect that the organism had got into the wound, but here the lambs were still unborn, enclosed in the womb which during the greater period of pregnancy was hermetically sealed, and as they had hitherto believed, it should not have reached the body of the lamb. The only route by which it could have done so would be through the circulation, and it was suspected that some of the ewes might be found to be diseased in a similar manner. It opened up a very large question. It was impossible to ask the owner to kill one after another, even if he were compensated, and so the investigation came to a full stop. His principal object in bringing the matter before the meeting was to show them the livers and the specimens exhibited, and to ask them to look for the presence of the disease in any new-born lambs they should come across. He wished them to mark the ewes giving birth to these lambs, and then to communicate with him and to send the lamb on for examination. In that way he might be able to trace the disease back to the ewe.

Tapeworm in Lambs.

The next disease dealt with by Professor Cave was tapeworm in lambs, for

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience,** we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back,** or **bowels, feeling of weight** and **dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid,** to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers** of **Daughters,** I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day,** as you may not see this offer again. Address:

MRS. M. SUMMERS. **BOX 309** **WINDSOR, ONT.**

How Many Hides Has a Cow?

Sole leather is not adapted to soft, tufted upholstery of automobiles and furniture.

Hides must be split into thin sheets to produce upholstery leather.

The two lower, fleshy grainless sheets are coated, embossed and sold as "genuine leather." That is why so much "leather" upholstering cracks, rots and peels so quickly.

DU PONT FABRIKOID
TRADE MARK

MOTOR QUALITY FABRIKOID
For Buggies and Automobiles

CRAFTSMAN QUALITY FABRIKOID
For Furniture

Guaranteed far Superior to Coated Splits

Fabrikoid is used by leading makers of automobiles, buggies and furniture, with entire satisfaction.

It is the ideal material for recovering your couches, davenports, dining chairs and morris chairs.

Fabrikoid averages twice the tensile strength of coated splits. It is waterproof and gives the appearance and "feel" of the best grain leather.

Sample of either quality free. Mention your dealer's name. Or if you send us 50c, we'll send a large working sample 18 inches by 25 inches, sufficient to cover a chair, etc. Write us today.

DU PONT FABRIKOID COMPANY
"Fabrikoid" is made in Canada. Dept. 506 Toronto

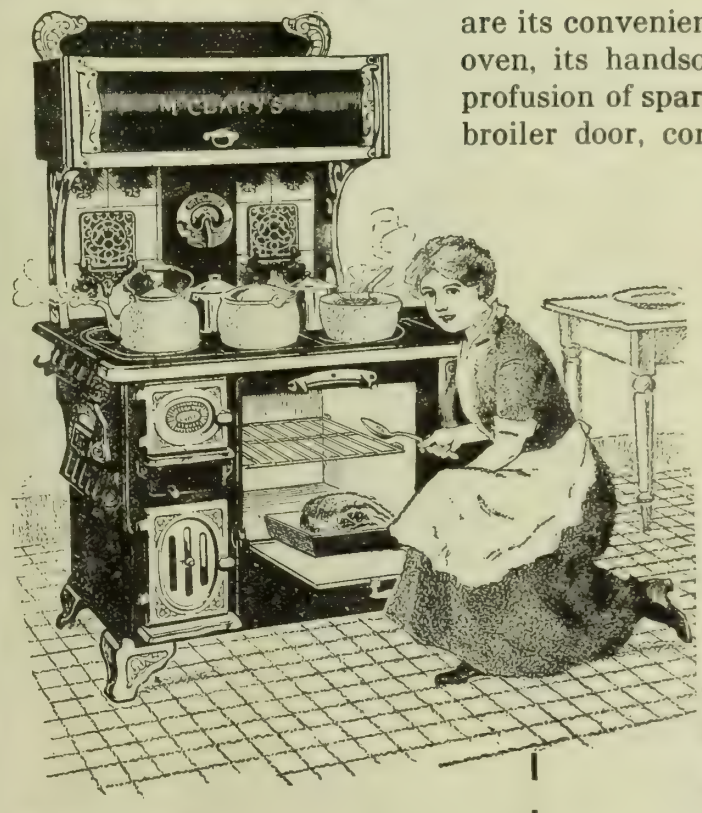
A good range in the big things and a good range in the small things

In the big, essential points of range merit, the "Kootenay" excels. One of these is durability, which is ensured by our use of "ARMCO" rust-resisting iron for the body, and Semi-Steel for the firebox linings. Another is cooking quality. The "Kootenay" has always been famous in this respect, and with good reason. The nickelled steel oven is one factor, the scientific flue arrangement and oven ventilation are others.

Points of minor importance, but which are much appreciated by housewives in

McClary's Kootenay Range



are its convenient high closet, its large oven, its handsome appearance with a profusion of sparkling nickel, its roomy broiler door, convenient dampers, etc.

You should read the full story of the Kootenay. Doing so makes you able to more greatly appreciate its good points when personally inspecting it at the store of your merchant.

Do not hesitate to write to us for the free booklet. Use coupon below.

McCLARY'S, London, Can.

Please send FREE, a copy of booklet entitled "The Kootenay Range and You."

Springbrook Ayrshires !

At our recent sale we sold many valuable cows, bulls and young stock. We still have on hand some of the best cows, heifers and young bulls in Eastern Canada, and with these we purpose to remain in the Ayrshire breeding business and again build up our herd to its former numbers. Meet us at the fairs this fall.

Our present offering includes:—1 bull 20 months old, 1 bull 8 months old, several females, all ages and some grand high grade cows fresh in milk.

McIntyre Bros.,
Sussex, N. B.

Clover Nook Stock Farm

Our parent stock has been tested and found free of tuberculosis. We are also running a performance test. When you buy from us you know what you are getting.

Our lines are Ayrshires, Holsteins, Tamworth and Berkshire Pigs, Dorset and Oxford Sheep.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

Percherons, Stallions and Mares

Twenty-five years of experience in breeding and dealing in Percheron horses enables me to offer better horses than any other dealer in Eastern Canada and at cheaper prices. I have blacks and dark greys, from 2 years old to 5; 1600 lbs. to a ton. I can spare a few mares. Special prices on stallions to Agricultural Societies for fall delivery. Write for pamphlet and prices.

Avocation No. 4796, U.S. No. 86048

F. J. SULLIVAN
Windsor, Ont.

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer::—

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16.114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

LEA & CLARK, Victoria, P. E. I.

Parasitic Diseases of Sheep.

(Continued from Page 27)

which he said one always looked in May and June especially in wet seasons. Tapeworms might appear in a flock in which none had been known to occur before, and he discussed how the infection might take place. It could not be believed that the eggs which were scattered on the ground continued to retain their vitality during the years in which no tapeworms were seen in the lambs, and his proposition was that in all probability the ewes themselves were the bearers and the hosts, though they showed no symptoms whatever of the infestation. They never saw an older sheep suffering from signs of illness due to the tapeworm, but it was quite possible—and he had proved it over and over again—that the sheep might have in their small gut one or two fully developed tapeworms and those were capable of breeding at an enormous rate. One might have 1,000 or 1,200 segments each capable of producing 40,000 eggs. Thus one infested ewe in a season favorable for the tapeworm—when there was much moisture —would be sufficient to spread disease over the whole flock of lambs. That suggested a line of treatment—to try as far as possible to rid the ewes of the tapeworms. He suggested that they should be dosed two or three times during the winter months with some tapeworm remedy, and that while the dose was acting on them it would be a good plan to put them on arable land or to fold them somewhere away from the old pasture in order that any parasites expelled might fall on ground from which eggs or young worms could not reach the sheep land. The young lambs as soon as they got on dry food, might be given daily small doses of common salt and sulphate of iron. This should be given in covered troughs so that it could not get wet, and where the plan was adopted he had every confidence that there would be much less trouble with the tapeworm disease in the lambing season, and that at the end of the summer the lambs would be in a far better condition.

(Continued in next issue.)

GUERNSEY BULLS!

I offer for immediate sale, the Gurnsey Bull, Lord Kitchener, No. 929, calved April 12, 1914. He is a fine type of the breed, and his sire and dam are of choice breeding. Will sell at a moderate price, as I am overstocked. I also have several younger ones for sale.

The Yarmouth County Exhibition

The Yarmouth County Exhibition again maintained the high reputation it has long since established of being one of the best, if not the best, shows, outside of the provincial exhibition at Halifax. Amongst the several factors that have given this exhibition its high reputation must first be the work of the managing committee, with Mr. E. G. Spinney as president, and Mr. Wm. Corning, the genial and indefatigable secretary. In the matter of weather, none better could be asked for, rather cold and windy, but fairly sunny; and weather makes a lot of difference in atttendance. But in spite of increased railway fares, and that fully 400 of our young men, who always are seen at the Exhibition, have enlisted, the number of admissions was very little below the best figures for any previous year.

Though there is always a variation in the size of different exhibits, this variation was more marked in special cases this year than noted previously. This was especially so in the case of fruit, flowers and some classes of the cattle show. A season of extremes in weather, very wet, or very dry, or very cold, resulted in much fruit dropping after blossoms had set. The high wind—unusually high and covering a period of several days—played havoc with the flower show. On the other hand, the show of vegetables was much larger than for many years. The grain and seed show was away ahead of anything seen here at any time, and there was a good butter show, though not so large as before. Whilst the exhibit of breads, preserves, and pickles was up to the average. Numerous articles of wearing apparel in the Department of Domestic Manufactures show that the manufacture of home made, hand made, goods is on the increase. Then the Corning, the Cann, and the Pinckney herds were all away at the Halifax, Fredericton and the Chatham shows. And yet there was a larger show of cattle owned by the small exhibitors than ever before. With a small showing of working oxen there never was a better showing of fat cattle and steers. Though there were but few exhibits in some classes of horses, other classes were more than full, so that all the new stalls added this year for horses were occupied. The show of sheep and swine was quite up to the average.

The poultry and show of pets was a honking, quacking, cackling joy-resort for the children; from the business standpoint of a grown-up there were many handsome birds of Plymouth Rock, Leghorn, Hamburgs, Silkies, with many Bantams, Pigeons, Hares, Rabbits and as specials, Guinea Pigs and a pair of handsome skunks with the "sting" removed.

Booths

In addition to places to exhibit special lines of goods, booths may add much to the general decoration scheme. Yarmouth is very fortunate in the matter of such booths, for Yarmouth exhibitors go in strongly for substantially built, well illuminated and artistically decorated booths. As it would be quite beyond the scope to describe them at all it must suffice to mention some of the larger and some of the more attractive ones. Amongst such would be Parker Eakin's booth, featuring the Robin Hood foodstuffs with free lunches and hot drinks for all. Albert Wagner's booth showing the Maritime Rug Co.'s rugs and mats; the Yarmouth Gas Co.'s booth displaying gas stoves, water heaters and burners, the whole a blaze of light. Then Porter & Robbins featured "reliab'e'l boots, shoes and everything in footwear. Dewolfe's booth with toothsome candies, made in Yarmouth; the Yarmouth Herald and the R. H. Davis booths with splendidly executed samples of the printers or bookbinders' art; W. N. Allan's booth with trunks, valises and ready to wear overcoats; E. H. Sinclair, representing W. F. Hatheway & Co., of St. John, in a neat booth, called attention to Tiger and other well known brands of tea; Royden Smith, with decorative wall papers; the Yarmouth Vulcanizing Co., of interest to autoists; these all had splendid looking booths and booth exhibits. In addition to these must be mentioned the booths for charitable purposes such as the one conducted by several Yarmouth young ladies to help the children's ward in the proposed new hospital, and the Local Council of Women's booth, in aid of Red Cross funds, decorated by and supplied with King Cole Tea and accessories free by the manufacturers. Other refreshment booths were those of Giarnon, Rozee, Churchill, Bower and the Kandy Kitchen, with similar booths without number outside.

The gateway Fish Company, a local concern, which though recently established, is pushing its fish wares, salted and smoked, way over to the war zone, had an appetizing exhibit in neat packages of all kinds of fish.

BARON'S OWN.

Champion Clydesdale Stallion at the Halifax Exhibition. Imported, owned and exhibited by R. A. Snowball, Chatham, N. B.

Skilled musicians, as well as Graphophones, pleased the large crowds who gathered in front of the piano and organ booths of N. H. Phinney & Co., Lawrencetown and of Messrs. Seavy & McNutt, of Yarmouth.

Automobiles were exhibited, a "Maxwell" by Smith, McKerson & Co., of Yarmouth, an "Overland" by Geo. E. Burrows, Yarmouth, a "Studebaker Six" by A. L. Pelton, of Kentville, and an "Oakland," from Gavel's Garage, Digby. These with a handsome "Dodge Bros." car, handled by the Empire Garage & Motor Co., a new car for these parts and a new concern in Yarmouth with a fine up-to-date reinforced concrete, two storey fire proof building, the finest in the Maritime Provinces, complete the autos.

Then there were the large exhibit of stoves, home made, exhibited by the new Burril Johnson Iron Co., and McClary's ranges, famous all over Canada, shown by Alex. Ross.

Only three varieties of separators were conspicuous, the Melotte, the DeLaval and the Sharples, who also had useful farm utensils and machinery on view.

In Machinery Hall, in addition to the autos mentioned, our old friend Chas O'Hanley, had his usually fine display of Bridgeport motors, lobster hoists, and gas engine accessories; T. P. Stubbert with a stationary 6-H.P. engine and truck scales, made by the Renfrew Machinery Co.; Frank Cox with carriages, ox yokes, and a sleigh all of his own make.

The Flower Show, originated, developed and in charge of Mrs. Chas. R. Kelley, made as good a showing as wind and weather of previous days made possible. There were some fine exhibits of colei, begonias, ferns, dahlias, stock, sweet peas, nasturtiums and collective exhibits. Amongst the chief prize winners were Mr. C. W. Durland and Trask & Shand, professionals; and Dr. I. M. Lovitt, Mrs. Henry Burrill, Vera Porter, Jenette Porter and Mrs. Gilbert Allen, amateurs.

Fine Arts and Fancy Work

Both of these booths were crowded with eager and interested sightseers the whole three days of the fair. The quality and quantity of fancy work was never greater nor higher. There was a profusion of sofa cushions. Irish crochet work, centrepieces, bureau scarves, night gowns, and lingerie, a most bewildering display of exquisite embroidery. In the adjoining booth there was a varied collection of curios on the tables consisting of checker boards, hand painted china, tooled leather, coins, designs for wall paper, cards, etc., and a unique miniature auto. The display of drawing and painting while not so large as for previous years, was wide in the range of subjects, treated and excellent in quality.

Third Annual Convention of the N. B. Womens Institutes.

MISS HAZEL E. WINTER

Superintendent of Women's Institutes for the Province of New Brunswick.

Never has a more earnest, sympathetic, enthusiastic and courageous body of women assembled together to discuss improved home and civic conditions as gathered together in the Assembly Hall of the Provincial Normal School, Fredericton, the evening of October 5th, for the opening session of the New Brunswick Women's Institutes Third Annual Convention.

It was a pleasing sight to watch the quick movements of the knitting needles during the entire meetings, and they seemed indeed a fitting accompaniment to the vocal solos and patriotic songs rendered frequently at the sessions.

It takes more than rain to keep the members of the Women's Institutes away from a meeting. In spite of the heavy shower the night of the first session, at least one hundred delegates were present, and their reward for venturing out a rainy evening, was ideal weather during the remaining days of the Convention.

Would it were possible to give in full the well prepared papers and educative addresses. Each and every subject on the programme was so ably handled by those taking part, that the Institutes are sure to be benefitted accordingly. Note-books and pencils are continually kept busy and at the closing session it was unanimously declared that the 1915 Convention was the banner one.

In part, the most helpful papers and addresses are as follows:

The address of welcome was creditably given by Mrs. J. J. Colter, of Fredericton, who extended greetings from the various women's organizations in Fredericton, and congratulated the Women's Institutes on the noble work which was so well recognized by the people of New Brunswick.

Mrs. James Porter, of Andover, president of the first Institute organized in New Brunswick and known as the "Mother of the New Brunswick Women's Institutes" expressed in her charming way the reply to the address of welcome.

The Minister of Agriculture, Hon. James A. Murray, on account of pressing business matters, was unable to be present, but Hon. George J. Clark, New Brunswick's premier was an excellent substitute and his few remarks were much welcomed by the delegates.

One of the ablest orators to address a Women's Institute assembly, or any other assembly for that matter, was Mrs. Laura Rose Stephen, of Huntingdon, Quebec. Mrs. Stephen has travelled from coast to coast. Her ability as a public speaker and her wide range of present day affairs has placed her in the front rank of Institute workers. She endeared herself to every member present, and in her earnest, fascinating manner did full justice to the addresses on "Patriotism and Production relating to the Home," "My knowledge of Women's Institutes," and "The Influence of Environment," the former of which was given as follows:

"O beautiful and grand
My own, my native land,
Of thee I boast;
Great Empire of the West,
The dearest and the best,
Made up of all the rest,
I love thee most."

"These words express the truest of patriotism. The word patriotic is derived from the Greek pater, meaning father and the definiation of the word is one who truly loves and serves the fatherland.

"The love of country is the strongest passion in man. It is more powerful than reason itself. Our country is the common parent of us all, that spot to which our heart is bound. There is a divineness in true patriotism. Truly it is a God given instinct, for if we care not for our country, if we are indifferent to its welfare, and too cowardly to stand up for its defence, we may lose all, land, home, loved ones, friends, and become wanderers on the face of the globe or slaves to a tyrant.

"More than maiden, more than wife. more than children, more than life, has a true man to love his country. When danger threatens the land he has to leave all and cheerfully answer the call to serve, and the patriotic wife dauntless sacrificing spirit is portrayed when she says: "Had I a dozen sons each in my love alike, I had rather have eleven die nobly for their country, than one voluptuously surfeit, out of action.' And just here I would like to say the only people who have made any sacrifice worth noting are they who have given of their own flesh and blood. We have given of our time and means, but have we made any sacrifice in the war in so doing. We dress as well and our tables are as laden with good things and our sleep as unbroken as of yore. We cannot say the war has penetrated into our ranks and yet I mistake the calibre of our people if I judge them not ready to meet any demands that a country in distress may exact of them, and that brings me to the highest standard of patriotism. By marching unasked to the aid of the oppressed and down trodden, have we not shown that our country is the world. Our countrymen are all mankind. There are no points of the compass on the chart of true patriotism. The brave love mercy and delight to save. It is this spirit that prevades the armies of the allies and which will bring victory to our cause, for war will never yield but to the principles of universal justice and love. Our wish to conquer is but to save.

"As the ranks are broken, standing ready there are those to step in and fill gaps. And so it shall be to the end. Our men are too truly great to see a cause so just and necessary falter or fail for want of help, and when our country's own peril is considered where is the coward who would not dare to fight for such a land. We have had many occasions during the past months of being proud of the achievements of our boys at the front. Their truest bravery has been often shown by performing without witness what one might only be capable of doing before all the world.

"Those of our kith or kind who have fallen in active service or lanquished on beds of sickness, for sometimes it takes more bravery to live than die, whether our boys sleep the long sleep in an unknown grave, or come back to us sightless or crippled or broken in health they have fought the good fight. They have shown the greatest of patriotism and we owe them more than tongue can tell.

"And those who have said good-bye to husband, brother, or lover, you too have acted nobly. If sorrow has come to you, we grieve with you in your sorrow, and at all times we sympathize with you in your constant anxiety.

"The women of our land and especially the women of our Institutes have risen in all their womanliness and shown themselves to be true mothers in Israel. They are bravely and industriously doing duty on home guard, knitting, sewing, making jams, and jellies, by every way and means raising money to swell the Red Cross and Patriotic funds. It would almost seem that the Institute had been created to meet this strenuous unprecedented crisis. The amount of work this organization has done is simply stupendous. The Institutes of Ontario alone have raised over Thirty Thousand Dollars, and sent thousands of bales of goods to the hospitals and to the solider in active service. This is the highest form of home production, for this work has largely been accomplished by the hard working wives and daughters throughout our land. Women have told me that the only way they could get their soldier socks made was by rising an hour earlier to knit and sitting up an hour later.

"It is encumbent on us that we should give. To give we must have, to have we must save, to save we must be economical. Cicero said, economy is a great revenue. As a nation we were becoming spendthrifts. Extravagant in our dress, our house furnishing, our table. Bringing up our children in the lap of luxury, running to excess in everything and now suddenly there has come the cry to halt, and it is going to be to our material and physical, and shall I add, spiritual, good. Nothing lovelier can be found in woman than to study household good, and certainly the faces of many of our girls have been turned from the parlor back to the kitchen. One of our productions of this present war is the making of cooks. Why even the homely art of porridge making was becoming lost. The breakfast food was taken already prepared from the package. But that is a very dear method of supplying the table and so the good old-fashioned pot of oatmeal porridge is to be found on the stove, and by the way, do many of you ladies make rolled wheat porridge, it is such a wholesome, pleasant change from the rolled oats. When I go into the farm homes it always hurts me to find fresh bakers bread on the table. Someway we don't look for that. We know that lack of help and the constantly added luxuries make bread making a seeming burden. But it is a calamity for nothing can take the place of the good home product. It gives better digestion and more strength and it is one-third cheaper to bake than to buy bread. I would welcome the day when the bulk of our bread could again be of home production. The best test of good times is the dinner on the table at noon, and if there be large plates of flakey home-made bread, the times are not out of joint in that home at least.

"The most expensive way to live is to furnish food from the bake shop, the package and the tin can. The home should be as much as possible self-sustaining. That is the reason why Germany is holding out so successfully, she has everything within her own borders and since the war has a most frugal, industrious, well trained people, large cooking schools have been established for German housewives to learn to make the very best use of cheap food materials. Nothing is allowed to go to waste, every scrap of cloth is utilized, even old kid gloves used as lining for clothing. In England the formation of a woman's thrift league is contemplated, to give instruction in all domestic matters so as to get the most from the least expenditure. The Ontario government issued a pamphlet on the best foods to buy during the war, and how to secure the highest nutritive value at the lowest cost. Food principles were given with a list of the cheapest and best vegetable and animal foods. Also recipes selected for their nutritive value. We cater too much to what we like and not enough to what is good for us. We are like the small boy who said he would rather eat what he'd rather. A most wholesome dish is made from boiling for a day whole wheat, which has been soaked over night. It is eaten hot with cream or milk and sugar. This is called frumity, tastes good and makes a perfectly balanced ration.

"Grandmother cured bacon, made cheese, sugar and syrup, dried fruits, wove cloth from necessity and love. What was then done in the home for love is now done in factories for gain and the object is not so much for quality as for big profits.

"Home production was a source of great pride and pleasure to the past generation and war times are going to bring about a revival of good home products.

"The making of garments in the home, even the children's clothes, is fast growing out of fashion. The excuse is ready-mades are so cheap. They are cheap, that we will admit, but how often the quality is poor and the workmanship indifferent. A well made home article outlasts two ready-mades.

"There is another feature of the ready-mades which should be emphasized. Invariably they are bought from catalogues and the money is sent out of the district. The mail-order system is ruining many a country town which otherwise would flourish. The big cry has been "Buy Canadian made goods," and I would add "Buy them in your home town stores." Nothing will give home production such a stimulus as being loyal to home trade.

"I have six living brothers. When they were small my mother made their little coats and pants from the discarded grown ups clothes, and how they did wear, for the cloth in them was far better than one would feel like buying. This home production is one worth trying and will be a great saving.

"I would not be true to my special hobby if I did not bring in the garden as one of the greatest assets to a home. The value of a good garden can hardly be over-estimated. To have an abundance of fresh fruits and vegetables of one's own raising is reducing the cost of living one half. The tables are better supplied. The family's health is better, the doctor's bills fewer, and the pleasures of living increased. The lover of a garden lives a fuller, sweeter life than one who has no taste for such. Becoming a coworker with the Creator of all things, watching day by day the wonderful mystery of the seed developing into

the full grown plant, working in an atmosphere redulent with the perfume of flowers, and thrilling with the song of birds, truly this is getting the best from life. Everybody to reduce the cost of living and add a new interest to life should cultivate a piece of ground. While our men fight, while financial conditions are strained, and purse strings have to be drawn tighter, women can help work the land and create a new and greater wealth than has hitherto been dreamt of.

"The time has come when everyone from the geratest to the least must economize, the rich, they may help the poor. The fate of the world lies largely in the hands of the women. The nation must save, the women, the housewives must see to it that the nation does save. There is a great and splendid part for them to play. The wife of the working man has perhaps the greatest problem to face these days. In addition to raising children and manging the home she must spend her share of her husband's earnings. Here is the rock on which many come to grief. The science of buying is an important but unfortunately a neglected one. The main principles of economy must be learned and the true value of things understood. The housewife should have the strength of character to withstand the lure of the bargain counter and buy only what is really useful and necessary. Earl Gray says the future of our country lies in the hands of the mothers and teachers and this brings me to the last point of my talk. The greatest, the best production of our homes are the boys and girls in them. The over-whelming mystery of life is not death but birth. The chief reason for setting the social house in order for suppressing wrong, for safe-guarding all that is true and beautiful is to make ready for the coming of the little child. The most important person in society is not the man in the last year of the professional school, but the little child, who by his surroundings is being crippled or set free. The golden years of a child lies at the very beginning and the deepest education is imparted in the light of dawn.

"If Canada is to hold this high place the destinies have set apart for her, the homes of Canada must produce sons and daughters worthy of such an heritage, healthy, honest, sober, educated, industrious, economical, worthy children of worthy parents. No greater gift can the home give to her country than a family of good children.

The Institute must stand for all that is good. We must safe-guard our children from evil and I will welcome the day when, as a body of workers the Institute members come out boldly on the temperance question and say, 'For the protection of our homes, the saloons must go.' The mothers and fathers have a tremendous responsibility resting on them. And I would that more honor and notice were bestowed upon the fathers. A mother is loved, but a good father is adored by his children. The parents should stand side by side, the father taking his equal share with the mother in guiding in the right path the most precious product of the home—the boys and girls.

"We must be true ourselves if we wish to be helpful to those around us, and this is the ideal I leave wtih each of you in closing:

'I would be true for there are those who trust me
I would be pure for there are those who care,
I would be strong for there is much to suffer;
I would be brave, for there is much to dare;
I would be friend to all—the foe—the friendless;
I would be giving and forget the gift;
I would be humble, for I know my weakness;
I would look up—and laugh and love, and lift.'"

The demonstration on "Dressmaking," by Miss Annie Martin, of Fredericton, and on "Millinery," by Miss Corkum, of Miss Morgan's Millinery Establishment, Fredericton, were heartily received by their large audiences, and so quickly passed the time allowed for these practical talks and demonstrations it was with regret they had to be discontinued for other subjects on the programme.

The chief points Miss Hazel E. Winter, the supervisor, touched upon in her report of the year's work, included: the growth of the Institutes and membership in New Brunswick, the benefits resulting from the Institute, the annual short courses, traveling library at the disposal of the Institutes, the part our Institutes are playing in this world-wide war and the responsibility still resting upon the shoulders of the members, the methods adopted by the Institutes to swell funds and the numerous ways in which this money was expended, some of the ways the department has throughout the year expended the Women's Institute appropriation, and lastly the results of the co-operative efforts on the part of the members to improve their branches in every way possible.

Mrs. G. C. VanWart, Regent Provincial Chapter Daughters of the Empire, illustrated her talk on "Comforts for the Soldiers," showing samples of garments made up. Many practical hints were given on improvements in garments now being sent to the soldiers, and the ones to be needed the most during the winter campaign. Mrs. VanWart's closing words were, "In conclusion let me remind you that socks are the greatest need, so when in doubt, knit socks."

The Canadian Home Journal is the Women's Institute official organ throughout Canada, and the helpful address as given by Mr. J. Leslie Rook, of Toronto, who is closely asociated with this Journal, can only result in there being a more general co-operation between the Women's Institutes of New Brunswick and their faithful friend the Journal.

Dr. H. V. B. Bridges, principal provincial Normal School, gave an address on "Books and Pictures in the Child's Education." In order to pass this helpful address on to others it will be fully published in the 3rd Annual Report of the New Brunswick Women's Institutes.

The Women's Institutes have a splendid opportunity to encourage and assist in "School Gardening" if they carefully follow out the suggestions as given by Mr. R. P. Steeves, Director of Elementary Agricultural Education in his address on that subject.

Methods of combating with that terrible disease—the white plague—and the necessary precautions to take if once it is in one's household, was possibly the most instructive address of the Convention. Dr. Townsend, Superintendent of River Glade Sanitarium, illustrated his address with lantern slides, showing the different stages of the disease, the improper and proper surroundings, and the building at River Glade Sanitarium where the patient is taught to look after his own case and to precent the spreading of the disease.

The following resolution was unanimously passed at Thursday morning's session. "Resolved that the Women's Institutes of New Brunswick place before the provincial government the need of one or more women on the Provincial Board of Health, also on the city and county boards.

The Countess of Ashburnham and Mrs. Havelock Coy, both of Fredericton, were heard to advantage in patriotic addresses. It is regrettable that space will not permit giving in full the earnest appeals of these ladies. Every heart in the audience was deeply touched and the women could not help but return to their homes with a deeper understanding and a broader conception of their duties to the British Empire.

Mrs. Laura J. Winter, who is well known to the majority of Institute workers in our Province, with her experience as a trained nurse, gave the following address which it would be well for every mother to read:

"The Home Emergency Chest."

"In any walk of life, to be cool-headed and calm in emergency, is essential to success. And nowhere are these needed as much as in the sick room or cases of accident.

"If, when an emergency arises, one has to look for things to work with, one becomes excited and loses much valuable time, so to have things prepared at hand overcomes this difficulty.

"Home-making is the business of all the ladies here this evening To be a home-maker is the natural sphere of woman. It is her highest calling, so let us think of it in the right way and prepare with the purpose of being contented only with the best. Also bear in mind that among our most successful homemakers we have a goodly number of unmarried women.

"To be successful in this walk of life we must know at least something of a great many things. A homekeeper not only needs to know housekeeping, such as the routine work of any house, but must also be a cook, seamstress, nurse, teacher and decorator, and so to be able to fulfill all these duties, we must have a place for everything and have all things in their place.

"I have been asked to tell you something of the Home Emergency Chest, which chest is supposed to contain medicine. The chest I have with me is home made and as you see can be readily manufactured out of a Surprise soap box. I show you this so each one will know how easy it is to have a proper case in the home for the simple remedies needed.

(1) "Do not fill your chest with half emptied prescription bottles, or anything you have been using in case of severe illness. Throw all such away.

(2) "Have your bottles and cans marked plainly. A good way of labelling is to use narrow strips of adhesive, place on bottle or can and mark the name of contents with pen and ink. If any bottle contains poison put extra label on with the word POISON written in red ink.

(3) "When pouring medicine from a bottle always remember to pour from the side opposite the label, then your bottle will be neat and clean, and your label will stay in place.

Contents of Chest.

(1) "Pure alcohol. Never use wood alcohol near a patient. It is very injurious to the eyes and a small amount may cause blindness. pure alcohol is used for bathing the head to relieve pain. For the bath when used for fever bath, the evaporation is more rapid because it is more cooling. It is used always in the care of the back of a bed patient, either in the pure form or diluted half with water. Also a mild disinfectant.

(2) "Witch Hazel.—Good to bathe tired head and eyes, very restful. It is also good for the complexion, helps to close large pores in the skin.

(3) "Peroxide, very valuable. Used in cases of cuts and bruises of any kind, diluted one-half for children. It causes no unpleasantness when applied and is very cleansing. Used for mouth wash in a diluted form. If the teeth need special attention, powdered pumice mixed with a little peroxide makes them clean and white.

(4) "Listerine is another good mouth wash, but not necessary for the medicine chest.

(5) "Boracic acid powder solution, made of one teaspoon of the powder to one pint of boiling water. Bottle this and it is ready for use. Most frequently used for children's mouth and eyes, but is also good in cases of bruises, applied as a hot fomentation.

(6) "Castor oil. This is necessary in every house as a laxative for children and elder people. It is also used in the treatment of bed sores. Where a bed patient shows signs of bed sores by any redness of the skin, rub well with castor oil to the part daily after bathing with alcohol. It is a simple but very effective remedy. A bed sore is the breaking down of the tissues which only needs to be built up. To prevent a bed sore, and they are not necessary, keep your patient perfectly clean, the bedding clean, free from wrinkles and the bed free from crumbs. Rub the back at least three times a day with alcohol.

(7) "Olive oil. Used for either medicine or food.

(8) Carron oil. Equal parts of lime water and olive oil. Best remedy in burns or scalds. Never put water on a burn, cover the surface as quickly as possible from the air by applying some oily substance. Soak a piece of absorbent cotton thoroughly and bandage on the part, changing the bandage every few hours. After a few days leave off the oil and apply an ointment which the doctor will order. By this method there will be no scar.

(9) "Saratoga ointment. Is very nice for children. Can be had from any drug store.

(10) "Vaseline, (small jar).—Fine when you have a bad cold in the head. Apply to the bridge of the nose and forehead at night.

(11) Glycerine, (small bottle.)

(12) "Baking soda, small can. If you have sensitive teeth, wash with soda.

(13) "Mustard and flour in separate cans. For mild poultice, use three parts flour to one of mustard. For a child, add one ounce of glycerine or white of egg to prevent a blister. Is also used in the foot bath, and for a severe headache, by putting a poultice at the back of the neck, or pit of the stomach. A foot bath will also often relieve the pain.

(14) "Epsom salts. Outside of being a good laxative, it is effective in the bath in cases of rheumatism. In preparing a dose of salts, dissolve it in a small quantity of boiling water, filling the glass to the top with cold water. This makes it less disagreeable to take. It is well for those who cannot take Epsom salts to have a small package of Rochelle salts on hand.

(5) "Antifligistine. Can be used for any purpose in which a poultice is applied, especially in pneumonia and pleurisy. Easy of application. Place can in boiling water with cover off—till hot—spread on old cottton with knife and apply directly to the part. Will often relieve sore throat and croup.

(16) Small bottle of Iodine.

(17) Roches Embrocation for whooping cough. Apply as directed.

18) Roller bandages.

(19) Triangular bandages.

(20) Adhesive plaster.

(21) Cheese cloth.

(22) Absorbent cotton.

(23) Old linen and cotton, clean: with all seams, bindings, buttons, etc., cut off.

"It is well to have a little spirits of camphor or smelling salts.

Subjects relating to the Institute organization were classed under six headings, each member devoting five minutes to her subject. These short addresses, together with the Question Box and the many reports from the different institutes contained much useful knowledge for the promotion of Institute work. The short talks consisted of: "Interesting the Girls in the Institute," by Mrs. W. P. Fowler, of Hamomndvale: "Benefits of Roll-Call," by Mrs. A. A. Lewin, of Welsford; "Connecting Links between Home, School and Institute," by Miss Bessie Fraser, of Grand Falls; "Village Improvement Work," by Mrs. Her-

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50: 3 inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building, 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

OCTOBER 26, 1915.

DATES OF ISSUE.

November 9-23
December 7-21
January 11-25

FOR A MARITIME AGRICULTURAL COLLEGE.

A recent communication issued by the St. John Board of Trade says:—"Pressure is being brought to bear on the Government to provide the Northern part of the province with an Agricultural College. The Minister of Agriculture has promised the Newcastle Board of Trade that a College would be built on the North Shore as soon as possible, perhaps next year."

We have heard this question mooted on several occasions and we have also heard Honorable Dr. Landry, the Provincial Secretary and Honorable Jas. A. Murray, Minister for Agriculture, commit themselves at more than one public meeting to the policy of a multiplicity of Agricultural Schools for New Brunswick.

The Maritime Farmer contended in the days of the Liberal Administration and still contends under the Conservative regieme that the sane policy for New Brunswick and Prince Edward Island re agricultural Education would be to join in with Nova Scotia in the maintenance of one Agricultural College for the three provinces. Then with such an appreciable increase in finances instead of putting on only a two-year course at the N. S. A. C. (which name by the way could be changed to the Maritime Agricultural College) as at present, a four-year course could be instituted. This would necessitate an increase in the teaching staff of that already famous and efficient institution. These teachers could be used to good advantage in conducting research work in the three provinces during the season when they would not be bdsily engaged at the college.

Nova Scotia is achieving results with her Agricultural Education policy. The results are far reaching. There is hardly a village, hamlet or farming community in the province that has not profited either directly or indirectly by the establishment of the N. S. A. C. Not a few of the graduates of the N. S. A. C are holding important positions in every province of Canada and the United States, but the majority of the graduates have returned to their farms where they are putting in practice the modern practical ideas instilled into their minds by Prof. Cummings and his efficient staff. These young men are not only doing good work for themselves. Their neighbors who have not attended the College are gradually and unconsciously learning to follow their ways. The short course students of the N. S. A. C. constitute a noble army of men and boys who are better farmers today because they have attended the College for even such a short period as two weeks.

The farm homes of Nova Scotia have been materially benefitted because so many of the women and girls have taken a course in home making at the N. S. A. C.

The short Courses at the New Brunswick Agricultural Schools at Woodstock, Sussex and at the proposed School at Newcastle, or some other point on the North Shore, will accomplish a lot of good. The Maritime Farmer, however, believes that more progress could be made and with a great deal less expense by the formation of a Maritime Agricultural College. If, however New Brunswick must have an Agricultural College, what in the name of common sense is the use of dividing energies by erecting three or more expensive, inefficient Agricultural Schools instead of concentrating energies and building one efficient college, preferably affiliated with the University of New Brunswick at Fredericton.

Even with the amount of expense already incurred in the erection of the Woodstock and Sussex Schools we believe the province would make no mistake if it were to join with Nova Scotia in the maintenance of a Maritime College of Agriculture. Short Courses could be held at Sussex, Woodstock, Newcastle and perhaps in other central sections of the province such as is being held in Nova Scotia at Sydney, Antigonish, Musquodobit, Bridgewater and Yarmouth.

We believe Truro the proper centre for a Maritime Agricultural College because the N. S. A. C. has now nearly all the equipment necessary for conducting a four year course.

Hon. J. A. Murray and his coleagues however, have rosy visions of what the future holds in store for New Brunswick and its Agricultural Schools. We wish them success in everything they do for the advancement of agriculture in their province. Yet we maintain, more rapid strides along this line could be made by the united efforts of New Brunswick, Nova Scotia and Prince Edward Island in the maintenance ofone Maritime Agricultural College.

BEHIND THE TIMES.

A few days ago the St. John newspapers made mention of a resolution passed by the teachers of St. John condemning the Nature Study Course in the city schools. The meeting is purported to have been called by Dr. H. S. Bridges. A letter was read telling of similar action on the part of the school teachers of the Counties of York and Sunbury.

Commenting on there resolutions a recent issue of the Kings County Record said:-

"The Record believes that it does not do Dr. Bridges an injustice when it says of him, that he is a strong opponent of Nature Study in the public schools of New Brunswick and a firm believer in the scholastic side of the public school curriculum. In a word, Dr. Bridges is convinced that the efforts of public school teachers should be directed to the furtherance of the interests of the boy and girl with college ambitions, represented by less than one per cent of children entering the primary grades of the province, and that scant attention should be paid to the other 99 per cent of boys and girls, to whom New Brunswick must look for her future.

The Nature Course was adopted in New Brunswick schools after years of agitation and it was the sanest move the Department of education ever made. There is far to much ignorance of very ordinary matters in connection with nature study displayed by the average student of the public schools. In every wide-awake province of Canada, the teaching of nature study has been encouraged and to lend undue importance to the resolutions passed by the teachers of St. John, Sunbury and York, will be to turn pack the hands of the clock. Dr. Bridges has never ceased to offer opposition to nature courses as taught in the public schools of the province which simply goes to show that the gentleman is unprogressive. The welfare of over ninety-nine per cent of public school attendants may well be considered before the wants of less than one per cent of their fellows. The Record has unswervingly supported the introduction of nature study and agricultural teaching in the public schools of the province and believes that the board of education and the goverment of the province, will work inestimable injury on this province, if the suggestion of Dr. Bridges is entertained for a moment It would seem that there is need of further education among some of the teachers of the province".

On more than one occasion we have referred to an address in favor of nature study delivered before the New Brunswick Farmer's and Dairymen's association by Rev. Hunter Boyd, in the course of which he remarked "How much better it would be for our boys and girls to study about things like this—unfolding a colored chart of various breeds of farm poultry, sheep, cattle and horses—than to study about animals and birds they never see unless they visit a zoo or menagerie" The truth of Mr Boyd's assertion appealed to us then and we still believe in it.

Not infrequently we hear, not only boys and girls put also grown up men and women express the utmost ignorance of the most commonplace things of nature. At a recent exhibition a well dressed man, and to look at him you would say he was an intelligent being, asked a prominent Holstein Breeder what breed of cattle such and such an animal belonged to. The animal

Schools

Crowded out of their old place alongside of the fancy work and fine arts departments, the Public Schools and the Rural Science Schools made a fine showing in the new apartment specially fitted up for them by the management. There could be seen vegetables, grains and seeds in no way inferior to those grown by the adults. Collections of woods, bugs and butterflies, some of the latter showing the life history of insects, injurious to plants which promise much for the future of our farming industry, and drawings, designs, and modelling work which augurs help in the future for the fine arts and fancy work departments.

Coming now to individual exhibits of class and prize winners and beginning with horses, Yarmouth horses are still improving. Following the advice of the judges of years past, careful breeding has entirely weeded out the scabs and Yarmouth can now boast of a horse show second to none. Dr. Chas. Webster leads in the Hackney and Clydesdale class. Some fine roadsters were shown by Maynard Hoover, H. B. Cook and Geo. Bain, while Bain and Chas. Butler won prizes in the carriage class. In the general purpose class Harry Boyd and Clifford Cann had some good animals. The showing of draught and heavy draught horses was large, prize winners being Messrs. Crosby, Fred Churchill, R. S. Corning, Geo. W. Murphy and Fred Ross. Some very fine mares for breeding purposes and colts were shown by some of the above well known horse owners as well as Adolphus Corning, W. A. Churcill, R. A. Goudey, Geo. Killam and others. Splendid, fine stepping, spirited, well matched pairs were shown by H. W. Cook, Osbourne Churchill, Edric Cann and Geo. Bain.

As usual in the Shorthorn class the fine, widely known herd of Dr. I. M. Lovitt lead. His Lawndale herd is, however, smaller than in previous years, owing to large sales of this famous beef breed during the year. Osbourne Churchill's herd of Ayrshires up to standard with a few other breeders such as Jos. A. Ellis and Adolph Corning coming along.

The Jerseys represent a very large place in the show, even with some of our best away. In all ages, male and female, there was an excellent showing. Amongst leading prize winners are John C. Corning, Dr. I. M. Lovitt, F. G. and W. L. Cook, Fred Rose, Adolphus Corning, Chas Rogers, C. W. Cook and a long list of others, for the Jersey is perhaps the best dairy cow in this, a dairying county.

The supremacy of the Jersey is, however, disputed by the Guernsey. Both breeds having their good points and admirers. Hence in many cases some breeders and dairymen have herds of both. With H. W. Corning in the lead, as a Guernsey breeder, we find prize winners, too, amongst Lloyd and W. L. Cook, Emerson Servant, Hugh Murphy, Hartley Pitman and Murray Crosby.

Messrs. Henry Pitman, Harold Pinckney and J. F. Palmer represent the Devon herds with very fine animals, whilst the Churchills, Stephen and George, and Adolph Corning, Albert Fuller and the Misses McConnell favor the Holsteins.

The leading prize winners amongst the Herefords are the Burrills, Geo. H., Samuel and Webster.

Mr. Wm. O. Porter had a small, but complete herd of Polled Angus. This breed is a comparatively new one in Yarmouth and the adjoining counties. They are beauties. Any one who saw them could appreciate the remark of the artist who on seeing a picture of this breed, remarked that he did not believe any animal could be so handsome. On seeing them later he remarked that he did not believe any artist could do justice to their beauty. They are a serviceable, hardy, fine breed of cattle.

Quite naturally, leading dairy-cow breeders are also breeders of working oxen, steers and beef cattle. Amongst others winners are, of oxen and steers, Ivan Killam, Wm. A. Killam, Mereton Johnston, Geo. Delaney, Geo. Handy, Wm. H. Cann, and of beef cattle, Chas. Lyons, Chester Churchill, R. A. Gaudry and Aaron Churchill.

Were the dog nuisance properly controlled, our sheep exhibit would be even finer than it is. There is a big improvement due to the fine rams and ewes obtained through government assistance. Notably is this so in Cotswolds, Shropshires and Southdowns. Austin Robbins had some fine Leicesters. Fred Rose and Geo. W. Churchill lead in Cotswolds, whilst Chas. H. Butler and Adolph Corning fully represent the Shropshires. Alvin Robbins has fine exhibits of Oxford Downs and Cheviots. Grades and crosses were shown in large numbers by all the above as well as by Fred Rose, Jos. C. Robbins, B. B. Killam, Stephen Churchill and J. E. Elden.

Exhibits of swine are quite up to standard. Several fine, large litters were for sale for winter pigs, and some splendid boars and sows for breeding. Chester White and Yorkshires predominate. There were some very fine fat pigs and grades. Chief prizes went to W. A. Churchill, H. W. Corning, Emerson Servant, John C. Corning and Edward Cann.

The poultry exhibit too, was good. There were the three breeds of Plymouth Rocks, the barred, the white, and the buffs. In the latter class, E. F. Jordan of Kentville, pulled down all the prizes, as well as taking some "barred" prizes. In the "barred" class other winners were, C. W. Cook, Seymour Crowell and Percy Carly, White Plymouth Rock winners included, Gilbert Allen, Edward Horton, Hartley Pitman and Murray Corning.

In the White Wyandotte class we noted E. F. Jordan, J. W. Bain, and R. M. Churchill; Silver Wyandottes, J. W. Bain and Lawrence Churchill.

Other breeds, such as Light Brahmas, Leghorns, Hamburgs, Brahmas and Houdans, with Bantams, Orpingtons, and Rhode Island Reds kept up their usual continuous clatter, drawing attention to their prize winning owners.

Percy Carey exhibited a pair of capons and fat chickens; T. V. Butler, turkeys; Ralph Porter, Pekin ducks; Toulouse geese, Geo. W. Churchill and Lenley Porter; Emden geese, Gertrude Lewis and Fred Porter. And to wind up this part of the show we may mention Guinea pigs, John Blackadar; rabbits, Spencer Burrill; Belgian hares,, E. Matthews; Flemish giants, Rosie Herman; skunks, Rosie Herman.

Butter, though not so large as usual the exhibit of Dairy Produce, was very attractive, and all exhibits ranged high in the scale of points. Mrs. John C. Corning won prizes for crock butter, 5 lbs. roll or print, and for butter of fancy designs and packages. Patriotic mottoes, flags, etc., being very true to the real thing. Other prizes went to Mrs. H. H. McConnell and J. H. Cann.

Too much praise cannot be given to the exhibit of grain and seed. This exhibit, encouraged for some years past by a liberal award from the Dominion government, has been increasing in quantity, quality and variety of seeds shown. There were whole tables with good exhibits of all seeds commonly planted in the county and some of the rarer varieties. The county has long been famous for its turnip, cabbage, beet, bean, pea and corn seed, as well as for the oats, and barley seed. The competition was very keen. Amongst prize winners are, Fred Rose, G. W. Churchill, John Corning, Harold McConnell, Edric Cann, Chas. Pitman, J. M. Porter, Hartley Pitman, Adolph Corning, Wm. Pinckney, Albert Cann and many others.

The show of vegetables was pronounced the best ever. There was a very big exhibit of squash, one mammoth weighing 75 lbs., grown by D. A. Parker, and there were some splendid pumpkins, when one considers that there were two collective exhibits of vegetables, one containing 86 varieties by Wm. Pinckney, and one of 76 varieties by Gilbert Allen, it will be seen how wide a range of vegetables can be successfully brought to perfection in the county. The names of prize winners would take up the wohle paper. Some of the old favorite varieties of potatoes are giving place to newer ones. But the standard beets, turnips and cabbage do not change much. But in addition to the old standard kinds of vegetables for table use many new kinds are being raised in larger quantities. There were corn stalks, 10 feet high, and with good fully developed, well filled ears too. To be really appreciated the vegetable show must be seen. It cannot be described.

Although the exhibit of fruit was not as large as usual, what there was of it was even better, in quality, color, shape and size than has been seen at much larger exhibits of fruits. There were fifteen well filled tables of standard varieties including the

HORTICULTURE.

Marketing Apples.

Never does a year pass without a complaint appearing in the daily press about fruit which must hang until it rots on the trees, because it does not pay to gather and market it. Recently a correspondent of the "Times" made such a statement about apples in the Severn Valley, and added that he had sent six hundredweight of the best Keswick apples he had ever grown to Gloucester fruit auction, and received 9s. for the lot, with 7s. to come off for carriage and labor The writer can say from experience that such a state of affairs can be due only to ignorance of market and marketing methods. Even last year, when apples were superabundant almost everywhere,, he managed to dispose of all, and this year, when the fruit is much less plentiful, there is no difficulty in selling it at prices above the average. There may be a glut in some few districts, but this is certainly not the case in the country as a whole. There is much small "rubbish," due to the dry spring and a bad attack of blight (aphis), but even this is selling at prices that are better than those offered for the best apples last year. It is safe to say that even in seasons of the greatest plenty the grower who knows his business finds it profitable to gather and market his fruit. It is simply a matter of choosing a good market and packing properly. If there is a glut locally, send to a more distant market.

Unfortunately, many English growers are still content to throw their apples into baskets ungraded, or topped up with big specimens, and without troubling to put a standard weight into each basket. So long as such careless methods are adopted the best returns cannot be expected. The man who grades well, packs fairly, and gives full weight, soon obtains a good reputation which stands him in good stead in seasons of plenty, for his fruit is inquired for by buyers in the market.

There is nothing elaborate nor difficult about the packing of apples. The salesmen supply bushel baskets (sieves) for cookers and half-bushels (half-sieves) for dessert varieties. These should be packed to hold 40 lb. and 20 lb. net weight of apples respectively. Line the sides of the basket with newspaper, cut to the right depth, put a little hay in the bottom, and lap over the side sheets of colored tissue paper sold for the purpose. Use pink to denote "firsts," blue for "seconds,' 'and white for "thirds." Leave enough lap to fold over the top of the fruit when the basket is full. The fruit (carefully picked to avoid bruising) is graded into the baskets so prepared. Thirds are not always wanted; it depends upon the sample. The firsts must be all large, clean, sound specimens, and they should be put in one by one, starting round the sides of the basket and filling it up in layers. When full, adjust the weight, allowing for the weight of the empty basket. Seconds are generally packed in the same way, but the thirds need merely to be poured into the baskets. Fruit with open bruises or rotten patches should be thrown out and used for pig feeding. Many of the thirds this year are not much larger than marbles, but they are selling well. Grading is everything, absurd as it may seem in theory. When the baskets are full the colored paper is folded over the fruit and tucked in round the sides. Then a little hay is put on top and kept in place by two benders placed crosswise, their ends, being fixed under the rim of the basket. Instead of benders newspaper may be tied over the hay. Never mix varieties and pack fairly. Thus packed, apples travel well by goods train.—E. Mayhem, in English Exchange.

Apple Orchard Profits.

Net profits of $120 per acre have been made for ten years from a 10-acre Baldwin apple orchard in western New York used in experimental work. The orchard contained 27 trees to the acre and was 27 years old at the beginning of the experiment, which was conducted primarily as a comparative test of sod mulch and tillage.

U. P. Hedrick of the experiment station has made a detailed financial statement which shows the cost and returns that may reasonably be expected from a good orchard in its fourth decade that is well managed. It cost $1.29 per barrel to produce the fruit for apples delivered to the shipping point, and te returns were $2.60 or 100 per cent profit.

An interesting fact in connection with this work is that the yield varied from 2.16 to 5.60 barrels per tree, and there was a crop every year which amounted to an average of 116.8 barrels per acre, of which 79 barrels were of No. 1 and No. 2 stock, and 37½ barrels of culls and drops. The large amount of evaporator stock was due to heavy winds during two years, which took off more than half the crop.

An interest charge of $25 per acre at a valuation of $500 is made for the investment. This is a bookkeeping charge which comes back as a dividend. A charge for superintendance of $300 per year, or $30 per acre is made against the orchard, which is another bookkeeping charge that would come back to the owner as wages.

The annual yield in barrels per acre during the ten years was as follows: 1904, 125; 1905, 59; 1906, 112; 1907, 89; 1908, 152; 1909, 109; 1910, 71; 1911, 152; 1912, 151; 1913, 148.

The average annual expense was figured as follows:

Annual Expense for Ten Years

	Per acre	Per bbl.
Interest	$25.00	.21
Taxes	1.50	.012
Tillage	7.39	.063
Pruning	3.56	.03
Spraying	11.28	.096
Cover crop	2.74	.023
Superintendence	30.00	.25
Harvesting		.244
Barrels		.36
Cost per barrel f o b..		$1.29

Pruning and Spraying Plums.

Keep saw and trimming shears out of your plum trees. Just cut off a dead limb and if some limb so badly interferes with another one that it must be cut off, then do it. I have injured more trees by trimming them in the earlier days of my plum raising than from any other cause.

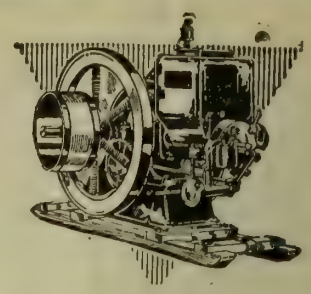
Spray the trees just before the buds open with lime-sulphur 1 to 10, then after the fruit has set with lime-sulphur, 1 to 40, adding three pounds arsenate of lead to the barrel which will be beneficial to destroy the brown rot. This spraying may be repeated every ten days, but must not be used within four or five weeks of ripening of the fruit.

Cut down or dig up old trees when they have lost their vigor and set out new ones. Dig a hole as big as a bushel basket at least in which to set the tree. Put some good rich loam in the hole, and a half-peck of wood ashes turned in after the small roots are covered will be found beneficial.—J. H. Tenney, Massachusetts.

You Save Time Labor and Money

and increase the earning power of your farm when you own a

FAIRBANKS-MORSE FARM ENGINE



It will do half your heavy work—better, quicker and cheaper than you can do it by any other means.

Simply made—easy to operate—requires but little attention—economical in fuel consumption--durable and reliable--in every respect 35 years of actual use have proven it to be the best farm engine made.

Built in many sizes, vertical or horizontal, portable or stationary. Guaranteed.

Type "H" 5 h. p., 4 cycle f.o.b. factory at Toronto. $150

Pinched Feet Bad for Trees.

Dynamite isn't a commodity that a woman ordinarily enthuses over, but Mary Jane Gregory of Colorado, has found something in it to commend itself to her. She had a number of four-year-old locust trees on her place and was anxious to have them grow uniformly, but last spring one of them showed no signs of life.

A neighbor was appealed to for advice. His opinion was that the tree was root-bound by the compact prairie soil in which it was growing. This man happened to be familiar with the use of dynamite and suggested as a remedy for the trouble that a bore hole be put down in the ground about three feet from the trunk of the tree and loaded with a small charge of the explosive.

Mrs. Gregory in speaking of the resutl of the experiment says: "This shot loosened the soil about the tree and a week or two later, it began to leaf out an da few weeks later was ahead of the other trees."—F. W. Wilson.

Grow Rhubarb in Cellar.

Plans should be made to have a supply of winter rhubarb. Rhubarb pie and sauce is always relished by everybody on cold winter days. There is no reason why everyone could not have a winter garden of this plant in their cellar, but do not wait too long before preparing this garden. In order to have nice tender rhubarb it is necessary that the plant grows quickly, all that is required is a warm cellar. This plant will grow with just moisture and heat for the roots, but if planted in a rich soil 4 or 5 inches deep it will grow more rapidly. A half dozen good roots planted will supply enough rhubarb for an ordinary family a month. After these are used, new roots must be started.

Dig some of the roots and leave them in a cool, dry place where they can be taken in when wanted. Then plant them as described and water and warm them. If you are too busy to dig the ground early the roots may have frozen dirt come up with them, but there is no harm in that, and you can plant the roots with the dirt on them. If you leave the digging until November, it may be too late, as the ground may be so frozen it will be impossible to dig the plants.

Joe Wins a Robin.

J. P. Landry, Poultry Superintendent at the N. S. A. C., was recently married to a Miss Robins, of Truro. The Maritime Farmer congratulates "Joe" on taking this important step and extends to him and his life partner its best wishes for a long, happy and prosperous career.

Flowers For Easter.

In October plant or pot your Holland bulbs for outdoor blooming in early spring. During the dark, cold days of November and the first winter months the bulbs will be embedded in the outside soil or in potts or boxes in the cellar, and seem to be hidden there, doing nothing. But all the while they are putting forth their sprouts and stems, getting ready to bloom, and when the warm April or Easter days arrive, and the outside bulbs have previously had some of the sunbaths of the earlier months and those in the cellar have been treated in the same way, suddenly your garden or the living rooms of your home will be made gorgeous with beautiful flowers in the brilliant colors and tones of the hyacinth, tulip, crocus, narcissus, and snowdrop. The very picture in the fancy of this enchanting herald host of spring should be enough to incite the home-gardener and the rural dweller and their wives and daughters to begin the planting of their bulbs at once.

For outdoor planting select a soil with good drainage, if possible; wet ground causes bulbs to rot. For a bed, remove the top soil to a depth of six inches and spade up the subsoil, adding well-rottted (never fresh) manure, or bone-meal, or both. Cover the sub-

soil, after the manure has been added with sand; then plant the pulbs, and cover with the top soil. Tulips should be planted 4 or 5 inches deep and apart; narcissus somewhat deeper and from 6 to 12 inches apart. As soon as the ground freezes, the bed should be lightly covered with straw, leaves, or brush; this prevents injury from freezing in winter and from thaws in spring. One of the best places to plant bulbs is in the borders amongst the perennials or in front of the shrubbery.

For indoor blooming, bulbs should be planted in clean pots or boxes containing rich loam or potting soil, fertilized with well-rotted manure. In the pots at the bottom, put a few pieces of broken pot, cinders, or charcoal. Cover this with a little moss (bog or sphagnum), or with fibre from sifted soil. Next(fill the pots with soil to within three-quarters of an inch from the uper rim; then plant the bulbs so that their tops are covered with thhe soil. Water and place in a cool, dark section of the cellar, and protect from vermin. When the stems begin to lengthen, bring the potted or boxed bulbs up into the early winter sunlight and warmth. In about six or seven weeks they will have bloomed, and by Easter your garden or home will be radiant with a glory of variegated color that will enchant the eye and cheer the heart. Plant your bulbs now.

W. R. Reek Will Fill Place.

(By Special Correspondence to The Maritime Farmer.)

Interim instructors are being engaged by the College of Agriculture to carry on the work of those members of the faculty and assistants who have enlisted. Mr. W. R. Reek, B.S.A., Director of Agricultural Education for Prince Edward Island, will conduct the classes in Surveying and Land Drainage, during the absence of Professor B. H. Landells, who is now a sergeant with the Princess Patricias. Mr. Reek will take charge of the senior class in these subjects, beginning October 19, and will also, as his directoral duties in P.E.I. permit, continue instruction from time to time throughout the new term. Before assuming his duties in the Garden Province, he was Assistant Professor at the Ontario Agricultural College, the same position that Principal Cumming held before he assumed his present function. The College management is also planning to fill with interim instructors the places of three other teachers who are completing arrangements to enlist for overseas service.

The regular classes will open November 2. On account of the large percentage of enlisted students, the senoir class will be smaller than in past years. But the number of applications from junior students is in excess of those received in October of last year. The addition of the new, large and well-equipped Science Hall will give the students unprecedented facilities for individual research work.

Winter Storage for Vegetables.

There are three important consideration in connection with the placing of vegetables in storage: 1, The vegetables themselves should be of good quality, free from disease or bruises; 2, they must not be put in too early or be piled so that any heating will take place; 3, they must not be subjected to an atmosphere which is so dry that it will cause wilting and thereby spoil their quality. It is possible for the home gardener to keep root crops, potatoes, cabbage and squash for some months in most house cellars with the exercise of some precautions, even where a cool cellar is not provided. Vegetables should be stored as far away from the heater as possible, excepting in cellars where freezing occurs. If there is a cement floor it is best to pack the root crops in boxes or barrels and cover the top with clean sand or sifted soil in which there is not much organic matter. A covering of about 2 inches is sufficient.

In case either the commercial grower or the home gardener lacks a storage place, there is the alternative which is available to almost everyone who has a garden. This is the vegetable pit. The essentials are: 1, A well-drained piece of land conveniently located; 2, some material to cover the pit after the cold weather comes The crops which can be successfully handled in this way are beets, carrots, parsnips, turnips, winter radish and cabbages. The outdoor vegetable pit is made in the following manner. On the spot selected, measure off a space 3 or 4 feet wide and as long as desired. Plan to have the pit extend north and south. The soil should be removed 8 to 12 inches deep the width of the pit and one-half of te eart thrown out on either side. The bottom of the pit should be made level and the sides cut straight down. The root crops are then piled on the ground the full width of the excavation and brought to a ridge about 2½ feet deep at the center. Rarely will the home gardener need a pit more than 6 to 8 feet long and it is wisdom for him to mix roots stored so that all sorts can be obtained at one end.

The commercial grower will do well to use one pit for each kind of vegetables stored. The roots should not be piled before the weather is cool. They should be dry and covered with about 2 inches of soil to prevent frost injury or wilting. As the weather grows colder, and preferably after the first soil covering has frozen nearly to the vegetables, more should be applied to a thickness of 2 to 4 inches. It is well to obtain this soil alongside of the pit in such a way that good drainage will be assured. After more cold weather additional covering of straw, meadow hay leavess or similar good protective material is added.

E. E. Emerson Recovers

"It is hard to keep a good man down, as was impressed upon the people in town when they welcomed Edwell Emerson in their midst again on Saturday.. Mr. Emerson was severely gored by a bull on the St. Stephen fair grounds a few weeks ago, but has now almost fully recovered, the only effect felt being occasional pain in the back, and this is wearing away.—St. Croix Courier.

Mr. Emerson is a prominent Ayrshire breeder in Charlotte county. The Maritime Farmer joins with its readers in congratulating Mr. Emerson on his recovery.

The Cheese Industry in Prince Edward Island.

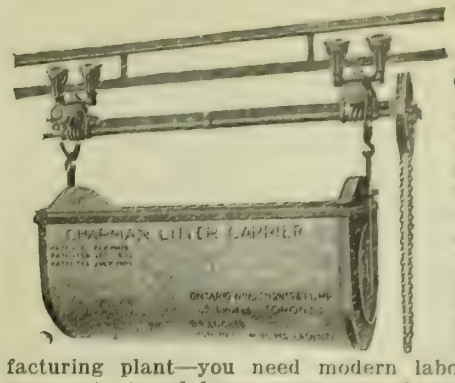
The year 1900 was the banner cheese year in Prince Edward Island. Since then the business has not been so good at the factories in any year by at least 10,000,000 lbs. of milk. In that year the milk delivered to the factories realized 60.75c per cwt. which no doubt discouraged the patrons. Last year, with a total milk delivery at the factories of 38,515,389 lbs., realized $1.01.6 per cwt., which was some difference from 1900. Island cheese is the best cheese in Canada. The average price received by the patrons for the past three years has been $1.02 per cwt. This is higher than Ontario by a couple of cents. The cool, moist climate of the Island, and the nourishing, salien grasses explains the superiority of Island cheese. The farmers of this "garden province" as it is called, stand, however, in their own light in bothering with cheese at all. Ever since 1900 it would have been more profitable for the farmers to have turned their milk into butter, for nearly every year since then milk made into butter returned a slightly higher price than that made into cheese, not counting the inestimable value of the skim milk at all. If we add the value of the skim milk, which at present prices of feeds would be about 33c per cwt., butter making comes out away ahead, while everybody knows it is less impoverishing on the land. Cheese making does not improve the soil, though it is far ahead of grain-growing; butter-making on the other hand, does not impoverish the soil. In the last three years of high prices for cheese, making the milk into cheese figured a few cents higher, not counting the skim milk. Last year, 1913, milk for cheese-making realized at the factories, $1.01.6, while that for butter-making realized $0.98 per cwt, but adding 33c for the value of the skim milk we see the advantage of butter making, to say nothing of the benefit to the soil of the little province.

Cheese will rule this year around $1 a cwt. for the milk, but farmers are beginning to see that the price is too low. Selling milk at that price this season with hay selling around $20 a ton, and meal around $1.50 and upwards, is certainly too low. The by-product of a cheese factory is valuable, if obtained fresh, but the whey is seldom obtained in any form, not being generally taken back by the patron. A few people near the factory usually get what they need, and the rest is let go in the drain. With the separator and the creamery, in this cool climate, the cream could be delivered in prime condition and the skimmilk retained at home to be fed the bacon hog of which this Island province produces such numbers, and such fancy prices for the British market, the full value of 33c would easily be obtainable when fed to the Island Yorkshire and Tamworth bacon pigs. I got some meal the other day, largely shorts, and it cost us $1.55 per cwt. f.o.b., at shipping point. This is as low as meal may be purchased, so that 33c per cwt. for skim milk is not placing too high a value on it.

I think that cheese-dairying is the lowest form of dairy farming, and fail to observe that the farmers in cheese districts get along as thriftily as they do in butter districts. The reasons are manifest, and need not be explained.

Why do the patrons prefer patronizing a cheese factory in preference to a creamery? Because it is easier to do so. Because tainted milk, dirty milk, and frequently sour milk, will be accepted at the cheese factory, where it would not at the creamery; because the poorest kind of milk, testing often less than 3 per cent is accepted, and because this poor, watery milk fetches as much per cwt. as the 5 per cent Jersey milk. None of the factories take milk by test. It is all taken by weight at Canadian factories, both in Prince Edward Island and Ontario. Patrons are all getting into the Holstein breed of cattle, so that they can furnish a large quantity of poor milk, an dare after doing away entirely with the Jerseys and the Guernseys which give rich milk. Apply the test at the factories and this will change back again. A good cheese maker—I mean skilled—can manipulate pretty poor milk into a fair cheese. Milk that would be disqualified at the city milk depot or at a creamery is, by the skill of our good (good is not the proper word, for a cheese-maker who accepts bad milk is not a "good" man) cheesemakers manufactured into passable cheese. This then is why the people patronize the cheese factory in preference to the creamery, though they know there is more money in butter. Slipshod methods and indifferent goods answers for the cheese factory; it does not answer for the creamery, hence one need not expect to find producers of clean, rich milk in dairy districts, nor the best farmers, either. I consider cheese-making except, perhaps, for a couple of months in mid-summer, a pretty poor system of farming.—J. A. Macdonald.

Your Barns and Stables Indicate Your Standing as a Farmer

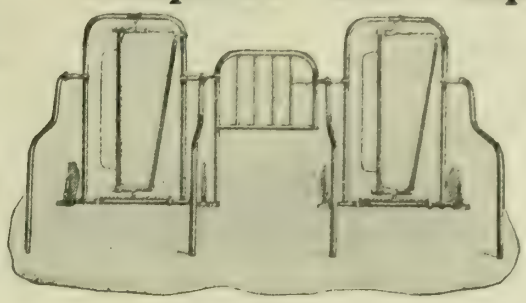


If you are a wide-awake, modern farmer your barn and stables will have the latest time and money saving devices.

A great part of the wages you have been paying for hired help, and therefore lost, will be put into permanent improvements.

Your farm is like a big manufacturing plant—you need modern laborsaving devices to increase your output and lower your cost of production.

Chapman Barn Equipment



Chapman Adjustable Stalls

Chapman Litter Carriers, Stalls, Stanchions, Water Bowls, these are what you need in your barn and stables. They increase production and cut down wages. They are sanitary—strong—lasting.

DAIRYING.

Two-Versus-Three Daily Milkings.

In the care of cows for Advanced Register work, one of the first questions that arises is "How many times a day shall the cows be milked?" The belief that they should be milked three times, or even four for maximum results, deters many from entering their cows.

In this connection it is well to note that the number of Guernsey breeders who are milking two and three times daily, is about evenly divided, and less than two per cent milk four times. Opinions vary as to the increase obtained. That some of the apparent gain is due to the cows handling a larger ration safely is probably true. The feeder unconsciously or intentionally gives the cows more grain when feeding three or four times than he would in two feeds per day. How the added cost of labor, with its bearing upon the routine of farm work, together with the larger grain bills, affects the cost of production, is an open question.

We need more carefully conducted experimental data along this line. The effect of unequal milking periods, with the varying percentages obtained, and if they affect materially the normal averages for the day, is also an open question. That others are studying these questions carefully is evidenced by the following very timely article in the "Farmer and Stock Breeder" of London, England, for August twenty-third.

An interesting pamphlet has been issued by the Armstrong College of Agriculture, giving particulars of experiments in milking and feeding dairy cattle. Those which deal with the times of milking throw little fresh light on the subject. Rather do they confirm general experience. The Offerton Hall tests are fairly conclusive upon several points. They drive home the prevailing opinion that a long and a shorter milking period tend to make the quality of the milk vary, but unless the long period is unduly extended there is not likely to be any variation in the total yield between dairy cattle thus managed and those which are milked at twelve hour intervals. The conclusions arrived at are as follows:—

1. It cannot be said that the total quantity of milk is influenced by the equal or unequal periods of milking.

2. So far as the percentage of fat in milk is concerned, it is distinctly shown that the length of time between morning and evening milking does very materially alter it.

3. The results distinctly emphasize the fact that one very important means of getting over the difficulty of poorer morning's milk is to endeavor to make the period of milking as even as possible.

4. It is frequently asserted that the general public demand their milk at such times as to prevent the more general adoption of equal milking periods. If by these and similar experiments it can be shown to the public that equal milking periods produce more even quality of milk, they may in time be sufficiently sympathetic to help the milk producer to get over what is at present a very serious trouble to him.

5. The results again emphasize the necessity in cases of prosecution for selling milk below the standard to take into consideration the desirability of taking an evening as well as a morning sample of milk for analysis before such prosecution is pursued.

6. It is possible that while the percentage of fat remains practically normal under conditions of severe drought the "solids not fat" may be lowered somewhat.

7. In both experiments the cows of Lot 1 gave slightly greater percentages of "solids not fat" in the milk. This was probably due to the individuality of the cows comprising this group.

8. The cows which were milked at even periods gave more milk in the evening than in the morning. The evening's milk was also slightly poorer in quality than the morning's. This is contrary to generally accepted experiences, as in ordinary farm practice unequal periods of milking are the rule.

To test the relative merits of milking twice and thrice daily, some experiments were carried out. In the main it has been found that there is no tangible advantage in three milkings in twenty-four hours, unless the demand for warm milk may be considered to justify it. The milk is poorer in the morning as a result of three milkings. The results are thus summarized:

1. It is commonly supposed that the milking of cows three times a day as against twice causes the cows to give a greater quantity of milk per day. As a sequence, if the milk is of normal quality, naturally a greater return of fat and non-fatty solids would be produced.

2. Previous experiments have shown that milking at equal intervals and twice a day does away with the great difficulty of the morning's milk falling below the 3 per cent limit. If such a system could be universally adopted, it would be well. A tremendous amount of prejudice on the part of consumers would have, however, to be overcome. Such a general change, too, on the part of the farmers cannot by any means be easily brought about.

3. So far as milking three times a day is concerned, the results obtained in these experiments show no advantage whatever. On the contrary, the extra driving and other undue interference with the treatment of the cows has produced results of a negative character.

4. Considering the difficulties in connection with labor, at the present time especially the extra trouble and expense of a third milking seems to be in no way justified.

5. It would be well for milk producer to study these facts, and through their associations get experiments of a similar character carried out. If such results confirm these experiments it would surely seem meet to get their associations to combine and move in the direction of getting one and all farmers to adopt the more economical system of milking twice a day as distinct from thrice, and at as nearly even intervals as possible.

6. The writer is well aware of the views of milk producers near towns, who are more heavily rented than farmers further away. They claim that one of the advantages they especially appreciate as enabling them to meet competition from far-away farmers is the demand of the part of the consumers for warm milk. But the question of producing milk of an even quality is of the utmost importance, and certainly seems to be worth more seriously thinking about by all concerned especially as no benefit seems to be got from thrice milking as compared with twice. The milk, too, in the morning from thrice milking is often of a poor character, and falls below the 3 per cent fat limit.

7. It may be well to mention that the practice of milking a heavy milker three times a day for a few days after calving for her relief has been in no way under discussion.

HECLA WARM AIR FURNACE **Leads**

You may choose the Hecla because the Steel Ribbed Fire-pot promises a good yearly saving of coal.

—Or the proof against dust, soot and gas assured by the Hecla Fused Joints may decide you in favor of the Hecla.

But even without these two big features found only in the Hecla, what a furnace this Hecla is! Look at it closely. Some furnaces have *some* of the points shown. But to have them all will mean greater comfort, greater economy, greater convenience.

Can we be of help in planning a heating system for your home?

Correspondence is invited.

The Care of Milking Machines.

One of the facts brought out at the recent National Milk Show at San Francisco, where milk was judged after it had been produced seven or eight days and shipped from all parts of the country, was that it is a credit to the milking machines, as several of them produced milk that exhibited as low as a few hundred in bacterial count.

One of the most important needs of users of milking machines is that of quick cleaning. This can be done by running cold water through the machines immediately after they have milked the last cow, until water looks clear, showing that the milk has been taken out of the tubes and cups of the machine. Then at least once a day it should be thoroughly washed with a washing powder that contains no animal fat, as animal fat is detrimental to rubber parts and tubes, such as all

Minard's Liniment Co., Limited

machines are now using.

The washing of a milking machine is similar to washing a cream separator. It should be done properly at the proper time. The same rule applies to all milking utensils. They should not be allowed to stand until the casein hardens.

The writer has seen a number of cases where through lack of washing the machines failed to produce proper results, either in speed or thorough milking. The man who is in the dairy business must expect to wash his dairy utensils the same as he would feed his hogs if he were in the hog business. Not only is this essential for the successful operation of the machine, but leaving the milk stand on the rubber parts any length of time is very detrimental to the rubber, as the animal fat acts upon it in a way that is damaging to the rubber. I thing that makers of cow milkers will testify that their greatest trouble comes from the lack of thorough cleansing of the tubes and cups. A vast amount of education on dairy sanitation has been given farmers in the past few years, and it is necessary that they take these lessons well to heart, if they invest in milking machines.

The Ripening of Cream.

To ensure the successful ripening of cream, certain essential facts are to be observed. These may be stated as follows:

(1) Obtaining an even condition of acidity by the action of pure lactic ferments, which development may be brought about by an even and suitable temperature, allowing pure, uncontaminated milk in the first place.

(2) It is absolutely necessary to have a dry and well-aired room, as a dark and damp atmosphere will cause a mould on the cream, which is certainly detrimental to flavor of both cream and butter.

(3) A certain amount of clear daylight is also required, but not too strong a light or direct sunlight, which falling on the cream, is apt to cause streakiness and discoloration of the butter.

(4) Pure air and clean surroundings are not to be forgotten, as cream is capable of absorbing all bad smells and noxious taints.

Cream when properly ripe, has a uniform velvety and leathery appearance and consistency, and if tested by the acidimeter, will show the presence of five to six per cent of acid, which is chiefly composed of lactic acid. In the cases where buttermilk is utilized as a souring medium, its quality must be strictly noted from day to day, because if it is not of a good, sharp, clean flavor, it may be the means of introducing and transferring injurious and destructive flavor, and this may continue during churing and after churing.

There are a few dairies where bad ferments have taken a tight hold, and it seems practically out of the question for the maker to produce a good-flavored butted. Where such is the case, it is essential to eliminate the taint, and introduce new life in the shape of a fresh ferment. A thorough spring cleaning of the dairy and everything connected with it should be the first part of the endeavor to eliminate the taint, the walls and floors being washed thoroughly, and all utensils scalded, so as to destroy as far as possible all injurious organisms present. The next thing which needs attention is the lime-washing of the walls; and then a new start can be made by scalding all cream to 150 degrees Fahrenheit, cooling and ripening it with a pure culture. It is as well to say that pure cultures do not by any means produce the finest flavored butter, as, when introduced, they only develop after a while. The explanation of this is that one species of bacteria, producing lactic acid only, does not develop flavor as well as some scores of other species doing this; thus where it is possible to obtain buttermilk from some dairy which is especially noted for the good and characteristic flavor of the butter, the use of this will in all probability answer the purpose better than pure cultures, and produce a good flavored butter immediately.

Turning Them Back

The importations of foreign separators into Canada are declining. The Canadian-Made Standard is turning them back, and at the same time making satisfactory progress itself in an invasion of United States territory. This proves beyond a doubt that Canadian capital, Canadian labor, Canadian brains and Canadian skill, as represented in the

Standard

Cream Separator, need not take second place to any other nationality. Government Dairy School reports have shown that the Standard is unexcelled as a close skimmer

Leading creameries have found it profitable to install Standard separators. Progressive dairymen who have used several makes have of late years been buying more and more Standard machines. This year the number of Standard separators sold in Canada in proportion to foreign makes will be far greater than in other years. This is a Standard year. And you are invited to help swell the total.

LIVE STOCK.

Effects of Salt and Rock Salt in the Fattening of Cattle and Sheep.

Cattle

At Cockle Park, the Northumberland County Agricultural Experiment Station, in the first trial with fattening cattle eighteen-twenty-four months old, during the winter of 1914-1915, twenty-four cattle just over eighteen months old in November, 1914, were used. They were all bred at Cockle Park, twenty-two of them being blue-greys from a white Shorthorn bull and Galloway cows, while two were from a white Shorthorn bull and Aberdeen-Angus cows. They were divided into eight lots, three beasts being in each lot. Lots A B C and D were bullocks, and were fed in boxes, there being one box for each lot. Lots E F G and H were heifers, and were fed in stalls. The trial began on November 19th and ended on March 11th. The main objects of the trial were to test the feeding of the cattle: (a) Without salt, (b) with free access to lumps of rock salt, (c) with one ounce of salt added to the food daily.

The Daily Feeding Rations

The daily feeding rations fed per 1,000 lbs. live weight were as follows:

FOODS

High swede ration, Lots C D G and H.	
Swedes	84 lb
Meadow hay	14 lb
Soya cake	3½ lb
Bombay cotton cake	2¼ lb
Bran	2 lb
Low swede ration, Lots A B E and F.	
Swedes	28 lb
Meadow hay	21 lb
Soya cake	2 lb
Bombay cotton cake	4 lb
Bran	3½ lb

As the average weight of the bullocks at the beginning of the trial was about 7¾ cwt. live weight, and of the heifers about 6½ cwt., the daily rations fed were considerably lower than the foregoing in the earlier months of the trial. Towards the end the bullocks were receiving more than the foregoing, as their average live weight was greater than 1,000 lb., but the heifers did not reach 1,000 lb. live weight at the end of the trial.

Results

The results show that the bullocks which received no salt gained on the average 17 lb. weekly in live weight, while the bullocks which had access to rock salt in the feeding troughs gained 16⅝ lbs. weekly. The heifers which received no salt gained on the average 12¾ lb. weekly, while those with 1 oz. of salt daily mixed with their concentrated food gained 13 lb. weekly. These results show that the salt had practically no effect either with the bullocks which had access to rock salt, or with the heifers to which I oz. salt was fed daily.

Salt in Swedes

The bullocks receiving the heavy root ration did rather better when they had access to rock salt, but not so when they were receiving the light ration or roots; and the same results were noted with the heifers. Mr. S. H. Collins, College Adviser in Agricultural Chemistry, found that the swedes fed to the cattle, and sampled on January 26th, contained 10.64 per cent of dry matter, including .02 per cent of salt. The cattle therefore consuming 84 lbs. swedes daily would receive about ¼ oz. salt daily in the swedes they ate, whereas those consuming 28 lbs. swedes daily would heceive about 1-12th oz. of salt in the swedes.

High and Low Swede Rations

From the results it was found that the bullocks receiving 84 lb. swedes daily gained on the average 18¼ lb live weight weekly, while those receiving 28 lb. swedes daily made live weight gains of 15⅜ lb. weekly. On the other hand, the heifers receiving the high swede ration gained 11⅞ lb. weekly, whereas those receiving the low swede ration gained 13⅞ lb. weekly. On the average therefore, practically the same feeding results were obtained from the high and the low swede rations, thus confirming former results at Cockle Park that substitutes for a large amount of swedes can be used that will give equivalent results consisting on concentrated foods and fodder, provided they contain the same nutrients.

Sheep

In the second trial, with fattening sheep in sheephouse during the winter of 1914-1915, the sheep used were forty-eight half-breed hoggs which had been bred at Cockle Park in season 1914. Three lots of sixteen in each lot were fed in the sheephouse. Each of the lots were in four pens, four hoggs in each, two of the pens being to the east and two to the west. A preliminary period of a fortnight preceded the trial. The hoggs were valued at 33s 6d. a head on November 7th, and as they realized 5⅝ pence per lb. live weight when sold, their value when the trial ended was just over 57s. a head.

Daily Feeding Ration

The daily ration per 100 lb. live weight (practically per head) was 10.7 lb. turnips, 1.2 lb. meadow hay, 4 lb soya cake, and 4 lb. Bombay cotton cake. Lot 1 received no salt, lot 2 had access to rock salt, and lot 3 had ¼ oz. common salt daily in the concentrated food.

Results

The results show that the sheep in lot 1, receiving no salt, gained on the average 1.87 lb. in live weight weekly; those in lot 2, with access to rock salt, 1.67 lb.; and those in lot 3, with ¼ oz. common salt fed daily with concentrated food, 1.76 lb. Salt, therefore, either in the form of rock salt or as common salt fed with the concentrated food, has not been an advantage, but rather the reverse.

Summary of Results with Salt.

In summarizing the results obtained with the use of salt, Professor Douglas A. Gilchrist says:

These trials were made because it has not been the practice at Cockle Park to use salt for fattening cattle, store cattle, or sheep, either indoors or on pasture. The object of the trials was to ascertain whether the live stock should have access to rock salt or should have the ordinary salt mixed

Eczema Was Cured Twelve Years Ago

Dr. Chase's Ointment Proved to be a Permanent Cure.

The old idea of eczema being a disease of the blood has been pretty well exploded by the record of cures made by Dr. Chase's Ointment.

Some doctors still advise internal treatment, but the results are slow and uncertain, and too often a lamentable failure. With Dr. Chase's Ointment it is different. You apply the ointment to the sore parts. It cleanses the sores and soon sets up the healing process. In a few days you can see with your own eyes the wonderful change that is taking place and are encouraged to keep up the treatment until the cure is complete and the sores replaced by smooth, natural skin.

It is wise to look after your general health, keep the bowels regular and the blood rich, but you can depend of Dr. Chase's Ointment to cure the eczema if you will do your part and apply it regularly.

Mr. W. H. Roberts, Charlottetown, P.E.I., writes: "I can recommend Dr. Chase's Ointment to anyone suffering from itching skin disease. I had eczema on my leg and suffered terribly from the itching. I had a doctor treat me for four months without relief, and I was getting worse all the time. A second doctor gave some relief for a time, but made no cure. I tried several advertised treatments, but without relief until I used Dr. Chase's Ointment. This ointment cured me in a month. That was twelve years ago, and I have never had a sign of the old trouble since.

"Since then we have always kept Dr. Chase's Ointment in the house, and find it invaluable for chafing, chilblains, insect stings and burns. I would not be without it if it cost $5 a box."

"This is to certify that I am personally acquainted with Mr. W. H. Roberts, and believe his statement regarding the use of Dr. Chase's Ointment to be true and correct."—(Signed) Alex. Horne, Justice of the Peace.

Dr. Chase's Ointment, 60 cents a box, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

The Carrier For You

IN choosing a litter carrier, one should consider all of the equipment necessary for a complete outfit: **Carrier, Track, Hangers, Switches, and Swing Pole fittings.** Do not place an order before learning of the many distinctive features to be found in Louden Equipment.

LOUDEN Litter Carrier

—is simple in construction, and easily operated. Carrier box is made of heavy galvanized steel, strongly reinforced with angle iron. Worm hoisting gear insures maximum speed and power. Track is of high carbon steel and is easily installed.

with their food. The foregoing trials clearly indicate that salt is not required for fattening cattle or sheep fed indoors at Cockle Park. It looks as if the foods fed to the live stock at Cockle Park contain a sufficient amount of salt, and that, therefore, the addition of salt is not required.

In the foregoing trials the prices per ton of the foods were taken as follows: Swedes, 10s; meadow hay, £2 10s; oat straw, £1 15s; soya cake, £8 15s; Bombay cotton cake, £6 2s. 6d.; bran, £6 5s.

Cockle Park is about six miles from the east coast, but the prevailing winds are from the south-west.—Exchange, England.

Mating the Ewes.

Mistakes are often made in buying rams. Selections of ewes are far more judicious. Ram sellers often fatten up their sheep to such a pitch that not only are defects hidden, but the animals are in some cases rendered useless as sires. A second plan to hide faults is to shear early, so that in the autumn, when most ram sales take place, the wool is so grown as to bear trimming in such a way that defects are hidden by paring down strong points to strengthen weak ones. Then comes the painting or staining process, which consists of so coloring the wool that the owner of sheep can scarcely recognize them. In this way the purchaser is deceived and some hidden defects in a ram may be imparted to scores of offspring. Buyers should seek out flocks well bred and healthy, where no making up is practised, instead of spending their money among breeders who go in for over-high feeding.

Ram Lambs

For two years I have tried experiments with Shropshire ram lambs, and the result has been very satisfactory. I have given each ram a score ewes, and singularly enough, both years I had an average of two lambs to a ewe. There were enough triplets to make out the singles. The lambs were very strong and healthy, and sold off fat to the butcher. The young sires after service were wintered and did well on ordinary fare. It is not likely that I should have got so many lambs from older sires. I took the precaution to mate full-mouthed ewes, which I consider much better than using theaves. I often see the advice given that ram lambs for use should be highly fed from birth, and be made fat by autumn. This is folly in the extreme, as not only are the young sires made unfit for early use, but are damaged in constitution for after years. In my experiments the youngsters only got very ordinary food, simply a good pasture, neither did they need more. Thus I am of the opinion that a few ewes put to ram lambs leads to satisfactory results, providing the lambs are tolerably strong.

Feed Ewes Well

This is necessary for a month or so before the ewes are mated, so that when the ram is brought to them they are in thriving condition. I do not approve of giving ewes heating food such as beans and peas. Grass, fresh "seeds," cabbage, or rape are wholesome feeds. Too often when every precaution is taken to nourish ewes before and about mating time neglect is shown afterwards. It would have been better even to have kept the sheep on poor diet all through for when full of lambs loss by way of abortion or other ills is sure to result among neglected flocks. Some extra food is always needed in winter, when pastures become bare, and bran, oats and linseed cake answer well with a few swedes. Broken-mouthed sheep should not be bred from; indeed they should be culled several years before the teeth fall out.

Mating Ewes Over-Early.

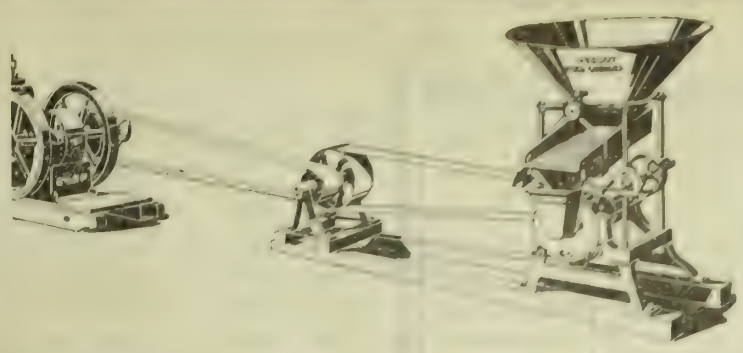
Many old breeders err in this, with the result that lambs fall before grass comes, the ewes get poor while heavy with lamb, and poorer still when suckling, and condition lost at such times is not regained until latter end of summer. Poverty leads to losses in yeaning-time, and that in many ways. When ewes yean towards spring they hold their flesh during pregnancy, give a good supply of milk, and keep in good order even until weaning time.—Warwickshire.

Saving Pastures.

For want of forethought or of knowledge many farmers do themselves double injury by not saving their pastures and not conserving the summer gains made by their livestock.

The rapid growth of grass in summer and the prevalence of fine weather enables fatting cattle, cows, and calves to make such excellent gains that by September they are generally i ngood condition. But cold nights and short days check the growth of grass. Consequently cattle left out in pasture during October and November eat up the grass to the last vestige. A double evil results—the pastures are cleaned so close that they are not in a condition to stand the winter, and the cattle, through lack of choice fresh grass, have become so thin and devitalized that they cannot make good use of winter feed, and thus get a poor start for gains when they are again put out to pasture in the spring.

Don't treat your pastures and cattle in that way. Get the latter housed in the barn at the beginning of the months when the short days and cold nights prevail and give them winter feed. Or, if you let them out to pasture during the day, then as soon as they are in the barn supplement the pasture grass they have nibbled with rape, soft turnips or other green feed. In this way the cattle will not lose the gains they made in summer, will be ready in the spring to go to the new grass able to assimilate it to the best advantage, and thus make further gains. At the same time the pastures will be in a condition which will enable them to produce a prime quality of fattening grass.



Vessot Feed Grinders

WHAT better recommendation than this could a feed grinder have—"It grinds flax, barley, corn, crushed ear corn, oats, wheat, rye, peas, buckwheat, screenings of any kind of mixed grain or any other feed stuff, fine or coarse as desired, and removes foreign substances."

"It grinds all feed stuff"—because of its excellent grinding plates. So well known are the original **Vessot** plates, and so highly regarded by all who know them, that imitations are appearing. To insure our customers getting genuine plates, we have arranged to have the trade-mark, "S. V.", placed on every genuine **Vessot** plate so plainly that you cannot go wrong. Look for the "S. V."

Vessot grinding plates do their work so uniformly well that a clean, satisfactory job is assured. The two-sieve spout removes all foreign matter, from nails and stones to dust and sand. One caution only—use steady, reliable power to drive a **Vessot** grinder, such power as is furnished by an **International Harvester** oil engine—**Mogul** or **Titan.**

Buy a **Vessot** feed grinder in the size best suited to your work and a **Mogul** or **Titan** oil engine to run it.

THE HORSE

Strangles.

Most horsemen will say at once that strangles is contagious, and personally I believe they are right. We know how strangles will run through a stable—indeed, through a district—and there are also cases on record of the transference of the disease from horse to man. As to the cause, it has been referred to cold, to dentition, and to domestication, but not one of these explanations will hold water for a moment. We know for certain that it is peculiar to horses, and that it is preeminently a juvenile disease, although horses of all ages are liable to it. It is uncertain whether horses take strangles more than once in their lives, and the point is difficult to solve, owing to the history of most animals being hard to trace, but the rule seems to be that it rarely attacks the same animal more than once, after which the predisposition to it disappears, while there is no doubt that many escape altogether.

Symptoms.

The symptoms of ordinary or benign strangles are, in the initial stage, general dullness, a slight cough, and a loss of appetite—symptoms that are practically those of a febrile condition, and might herald a cold or any inflammatory attack. The thermometer shows a rise in the internal temperature, which generally increases as the specific abscess is developed, and decreases with its bursting and discharge. There is a hard swelling to be detected on manipulation in the submaxillary space, the throat generally looks swollen externally, and is, from the inability or disinclination to swallow, obviously sore. The swelling between the jaw is hot and tender to touch, and steadily increases until its fluctuations on pressure indicate the presence of pus; the skin becomes thin, and, if not previously opened as soon as the abscess is ripe, it bursts and discharges. There is often a dribbling of saliva from the mouth, and more or less, generally more, discharge of bright yellow, thick matter from the nostrils. The treatment of simple strangles is also simple, but admits of some variation. It is a disease that runs a definite course, and it may be left severely alone. But the suffering may be materially diminished and valuable time saved by judicious treatment.

Good nursing is of the utmost importance—in fact medical treatment is quite secondary to it. Colts frequently develop the disease at grass, and then the patient should be at once removed to a cool, airy loose-box, care being taken, however, to avoid direct drafts. The stabled steed should be at once isolated. Too much stress cannot be laid on the necessity for an abundant supply of pure air, not only in this, but in all respiratory troubles. Not much food will be taken during the first few days, but the appetite should be encouraged with delicacies. Only small quantities of food should be given at once, and any remaining should be removed, if obviously refused. Green-meat in season, carrots, soaked peas, bruised and scalded oats, and hay-tea should be offered. In the case of working horses sufficient time should always be allowed for complete recovery—too much hurry may result in much greater loss of time.—Veteran.

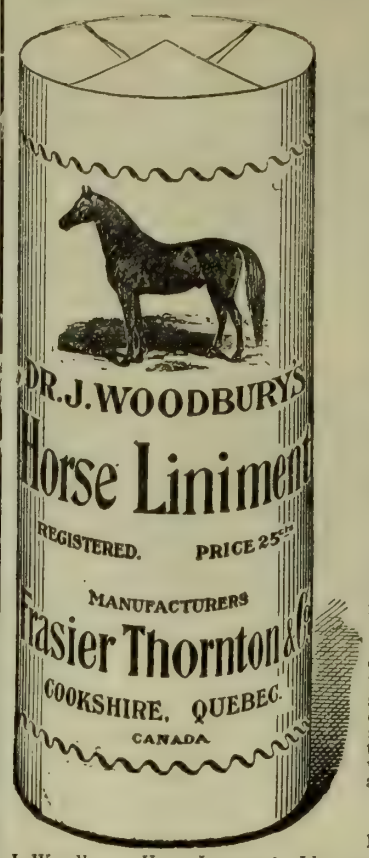
The Pleasure Horse.

To the owner of the horse kept for pleasure, and especially if he has a paddock attached to his little place, as is very often the case, turning out to grass seems to offer many advantages, but also it has drawbacks, because it is not reasonable to expect either hard work or fast work on a grass belly. The animal turned out is being kept more cheaply than it is possible in the stable, it needs less looking after, and gets exercise in its quest for food, but it is never what can be called "fit." The man who only requires the services of a horse occasionally owns an animal with a greater liability to disease and lameness than he who has regular every-day work to be performed. The horse gets the amount of grain necessary to working condition, it gets saucy, and is apt to "wax fat and kick," because its work is not regular. The old man, who has to cultivate the acre of garden, milk the cow, feed the pigs, clean the knives and boots, and carry up coals has no time and very little inclination to take the cob out for exercise. The owner, especially if the weather is bad, does not want to go out simply because ought in the interests of health and condition to do so, but when he feels like taking a drive, or the occasion arises, he expects to be able to go as fast as anybody else, and his horse to be in a condition to do it. There is really no way of keeping this class of horse in a condition fit for work, for whether kept in or turned out the animal is bound to be "unfit," although it may look sleek and fat.

The common practice is to catch the animal up from the field, full of grass, and blowing like a grampus, from having galloped all over it in evading capture, put him in the stable, and give him a heavy feed of grain while the thick of the dirt is taken off or out of him with a dandy brush. Out of this feed of grain the animal is supposed to extract strength and endurance to enable him to perform the work required, but he is more likely to get broken-winded through being driven hard or fast on a distended stomach or from eating too much inferior hay. It would pay better to hire

Dr. J. Woodbury's Horse Linimnt
INFALLIBLY THE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured. Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.
Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.
Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.
Truro, N, S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.
Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.
Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.
Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.
FRASIER THORNTON, &, CO., Limited, Manufacturers: Cookshire, Quebec, Canada.

than to keep a horse in idleness, but when this is impracticable or inconvenient the well-being of the horse should be studied by providing regular exercise. Without this the animal cannot be properly fed, and so kept in condition to work when required.

Teach Colt to Lead while Young.

"Do you want to see the mare's colt? It is in the shed. We can lead it any place." A hired man who was driving a team of big purebred mares proudly spoke these words. We went to the shed and sure enough there was the colt broken to halter, though not perfectly tractable, of course. He would have dashed for an open gate to go and find his dam. He preferred to play rather than to pose for his picture. He had been in training by the fond hired man for several weeks and had a good start toward becoming an easily managed horse.

I once knew two boys who spent a part of each evening teaching the farm colts to lead. The boys sometimes worked together, and sometimes they worked singly. If either was alone with a colt he carried a whip in his left hand so that he could reach behind himself and tap the colt lightly, encouraging him to walk up beside his young master. The boys were never abusive with the whips. The colts were taught properly to lead and they never forgot it. As yearlings and two-year-olds they were perfect in manner at the halter. At three they were put to work; no breaking was required. They work quietly and steadily and with full confidence in the driver.

MATCH SPECIALTIES
We have been making Matches for 64 years now—domestic matches and every other kind.
Some of our specialties are "The Gaslighter" with a 4 1-4 inch stick; "The Eddystone Torch" for outdoor use, (burns 35 seconds in any weather); Wax Vestas for the smoker and many other varieties.

They were always more satisfactory and better horses for having been handled and taught to lead while young.

Changing their Coats.

The season of the year when horses are changing their coats is, as a rule, a most trying period. Very few horses at work pass through it without becoming obviously out of sorts; they are "off color," out of working condition, labor mechanically, and become easily fatigued. Horsemen describe the condition as "having the blackberry on 'em," and certainly the blackberry time is rightly regarded as a critical period by all who have the care of working horses. Where it is possible horses should at this season be eased in their work. The effort involved in growing the winter coat seems highly debilitating to the horse that has to work as well, and the debility is increased by a heated stable and thick clothing. Therefore eschew the hot stable and the thick clothing while the summer coat is being shed and the winter covering is growing long enough to clip, and instead assist the process by extra grooming. If necessary, and not because of the roughness of the coat, give a little tonic medicine or a few "condition" powders. Do not, however, depend on the medicine alone; let the grooming be more vigorous and increase the nutrient constituents of the diet. Try to infuse a little variety into it, too, and provide a few carrots and some linseed. Linseed will be found especially useful at this season of the year on account of its effect on the skin and coat, and its promoting the digestion and assimilation of other articles of food. The best way to use linseed is to put 1 lb. of clean seed into a gallon of water in an earthen vessel, and let it stand covered for twenty-four hours, stirring occasionally. A pint of this mucilage and seed given every night is as much linseed as a horse ought to get. Exercise care, and spare the horse in every way until the critical period is over.—Veteran.

About Shying.

It may be doubted whether horses ever shy because of distorted vision. Defective eyesight does not necessarily give rise to shying. Take the case of a horse which shies at certain objects, such as a heap of stones or mud-scrapings lying at the roadside, and let us assume that, owing to impaired vision, it gets a distorted view of these objects. How is the animal to know that the object appears distorted to it? The heap of stones, perhaps, does look to it somewhat different from what it really is, yet it must be all the same to the horse whether it sees a heap of stones or a sack of potatoes or rubbish or what not, it being no worse off in that than a horse with perfect vision.

The Cause of Shying

By far the largest proportion of shyers are met with among horses of either a highly nervous temperament or else a very timid temperament—the latter especially. There would undoubtedly be a great many more cases of shying among well-bred horses, which possess a decidedly sensitive nervous organism, if it were not for the fact that the high courage characteristic of them, neutralizes their constitutional nervous tendency. This explains the fact why entires are so much less liable to shy than mares.

In Young Horses

It cannot be too strongly insisted upon that a young horse needs to be treated with the greatest forbearance and gentleness when it shies or makes a feint of shying on meeting anything which excites its apprehension. It should be cajoled and spoken to soothingly, so as to allay its fears and give it confidence. Given such patient management all tendency to shy will, in average cases, sooner or later, be overcome. If, on the other hand, harsh methods and punishment are resorted to the animal being forced past the object of which it is afraid at the point of the whip, the consequences may be disastrous. Such irrational procedure is a prolific cause of turning young horses into confirmed shyers. The animal comes to connect the sight of an object which excites its fears with punishment, and its shies from sheer apprehension of being punished whenever an unfamiliar sight is encountered.

The Confirmed Shyer.

Once the habit of shying has become firmly ingrained, whatever the original cause, it is practically impossible to cure, even with the most patient treatment, and the less one has to do with a bad shyer, especially for saddle work the better. The most suitable place for such a horse is in double harness where it cannot do much, if any, harm, for though it may attempt to shy its mate usually will prevent it from actually swerving or stopping dead. It is an established fact that horses are less liable to shy when driven in harness than when ridden. This is partly, perhaps, owing to their wearing blinkers, which prevents them from seeing some things which might otherwise startle them, but it is also largely due to the fact that, being harnessed to a vehicle, they cannot swerve or break out so easily as when carrying a rider.—F.

The most fascinating of all sports

Trap-shooting! The "sport alluring"! The *one great* out door game that appeals to everyone—men and women—young and old.

It's full of interest and excitement and with a little practice transforms the "couldn't-hit-a-balloon" amateur into a "crack shot."

Everywhere in Canada, trap-shooting clubs are springing up. If there's one in your town, join it. If not, let us help you to start one.

Get the trap-shooting habit. Also get the habit of shooting Dominion Shells, which are used by more Canadian trap-shooters than all other makes combined.

The reason is simply "all round dependability"—the result of first class materials, a well equipped factory and workmen of the highest skill.

Look for the "Big D" on every box of Dominion Shot Shells and Metallics. It's a guarantee of perfection.

Dominion is "the ammunition made wholly in Canada", and sold everywhere.

Any trap-shooting information will be gladly supplied free upon request. Address:

An Opportunity for the Girl in Rural Parts.

A convention of more than ordinary interest to the rural community has just been in session at the Ontario Agricultural College. It was called the School for Rural Leadership, and from what I could gather after attending a few of the meetings I feel confident that we will hear of some wonderful changes and doings in the country as a result of it.

There were many good speakers who brought out the needs of the rural districts; co-operation is the key note to success and the various organizations such as the churches, schools, Women's Institutes, Farmers' Clubs, and so forth, can do much to help solve many problems if they work hand in hand to avoid duplication.

Besides the good addresses that were given, the discussions at the close of each seemed to be even more interesting and came directly to the point. One of the talks that interested me most was on town and country co-operation, and the reason I speak of it particularly is because the question of the girl leaving the farm to find employment in town was brought up. It always seems to be the same old cry about the farmer's daughter, but what about the town girl, doesn't she want to earn her own living? But no one says a word about it because she can live at home. We are all inclined to think that the farmers' daughter in order to earn her living must leave home, but it is not so, and this is just where she has the advantage over her city sister as she has so much more scope and opportunity with endless raw materials at hand to deal with. For instance, one of the things mentioned (and I was so pleased to be there to hear it) was poultry keeping, as an occupation for the girls. If the farmers would give their daughters a little start in this direction by furnishing them with some good pure-bred stock, to be proud of, and a suitable hen house, and if possible a short course on poultry keeping at the College, they would have some stock in trade, and I feel quite safe in saying that many a farm would become quite noted for many, many miles for its fine poultry.

Another branch of work that the girls might follow is to make jams or jellies and specialize in whichever branch they can do best. The demand for these home-made delicacies by the best shops in our cities is unlimited, as such things are eagerly sought for by business women who have their own apartments where they get their own breakfast and evening meal. Vegetable canning and beekeeping weer also spoken of. Are we going to were also spoken of. Are we going to think they are good and worth thinking about.

Line Breeding Fowls.

If there is any difference between line-breeding and inbreeding so far as hereditary mechanism is concerned I have not yet had it explained to me. Linebreeding is a form of inbreeding which operates in a special way. Felch's chart, which diagrams what he calls linebreeding, provides that a start shall be made with a single pair of fowls. The male used in this mating is mated to next year with his daughters and the female with one of her sons. The third year the original male will be mated with his granddaughters and the original female with one of her grandsons. This produces two lots of chicks, those of the male line being 7/8 of the blood of the original male and those of the other lot being 7/8 of the blood of the original female. Now a male bird of the male line is mated to the female of the female line, and the result is chicks which contain exactly half of the blood of the original female. Then the series is started over again and goes on indefinitely. This is intensified inbreeding but many call it linebreeding because it sounds less offensive.

Whenever I say anything in public on this subject, I always insist that it is a dangerous method unless the breeder knows how to select breeding stock that is absolutely sound. The production of weak chicks is not so much the fault of the system as it is of unsound parent stock. At our house we never take any pains to save the life of weakly chicks. If they have not enough vitality to live with ordinary good attention we let them die without regret. We have lost just two chicks this year from causes that might have originated in a lack of vitality. There are probably several billion vigorous English sparrows in this country, yet every one of them is descended from half a dozen pairs that were imported a few years ago, and they have inbred to the limit without impairing their vitality.

Our best investigators are agreed that inbreeding is the only way to arrive at definite results. Those who firmly believe in Mendelism will say that there may be a vast biological difference between two descendants of the same parents, and they have considerable evidence in support of their position. I firmly believe in inbreeding, which I usually call line-breeding, but I just as firmly believe that it should not be practiced by amateurs or those who can not select perfect breeding stock.—Miller Purvis in Breeding Gazette.

Forcing the Molt.

Forcing the molt was quite the vogue among poultrymen fifteen years ago. It was originated by the late Henry VanDresser, who made it quite popular. Later Prof. Rice, at the New York Experiment Station, made some careful experiments with this system. He kept a year's record of hens forced to molt early and quickly and of others allowed to molt in the natural manner. His conclusion was that forcing the molt did not add to the number of eggs which a hen would produce in a year, nor did it increase the winter-laying; therefore, it would be a waste of time to force the molt in any fowls for ordinary purposes. If one wanted to fix up a lot of fowls for the early winter shows the forced molt would be all right.

The method was to reduce the feed gradually, beginning in August, until the flock would be on quarter rations. The fowls were kept on this short ration until they began to lose flesh, when they were gradually fed more until they were getting all they would eat of the most nourishing feeds available. Shortly after getting back to this full feed the fowls would begin to drop their plumage and often become almost naked in a few days, after which the new feathers would appear in due time. Prof. Rice prefers to keep his hens on full feed and let them molt in the natural way, as they will then lay some eggs during the molting season, while if forced to molt they stop laying entirely for several weeks, usually about 10 to 12.—Miller Purvis in Breeders' Gazettte.

Purchasing Breeding Stock.

The question of "when is the right time to buy stock?" is one that is confronting many. Whether, wanting to add one or two stock birds to your flock or wishing to purchase a pen of a dozen or more birds, now is the time to see about it. The best birds are always picked up first and the late comers have to take what is left, and besides getting a poor bird, often have to pay twice as much. Never wait until the spring to buy your breeding stock. In nearly every case you will get birds that were late hatched and consequently immature.

For the prospective poultrywoman who hasn't made up her mind which is to be her favorite breed it is a good plan to visit a good poultry show and there see all the breeds and their best. The Maritime Winter Fair will furnish a good opportunity for this, and all those who are interested in poultry should not fail to visit it, as it will help to settle the question of what breed to get. If the big shows cannot be reached any of the smaller ones will help. When a decision is reached the next step is to communicate with a good reliable breeder.

The woman who raises her own chickens is fortunate if she can produce her own stock birds, but so often this is an impossibility if she hasn't sufficient land or doesn't feel sure of her ability to choose the best birds from her flock. In this case she should purchase from a sources which will furnish her with the best type of bird, and above all get birds from the same strain year after year and thus establish the good qualities in her own flock.

Bleached Shanks in Layers.

Trap-nest records with many hundred fowls at the Maine station make it possible to say positively that no bird which has been a heavy layer will have bright yellow legs at the end of the laying season. Prof. H. R. Barrows says tht a "200-egg hens always have white legs at the end of their pullet year." The yellow coloring matter in the legs and skin seems to be used up in coloring the yolks for so many eggs, and thus the skin and legs bleach out nearly white.

It is worth while knowing this when culling the flock in the fall and deciding which pulelts to keep over to use as breeders the next year. If the poultryman has no trap-nest records the color of the shanks furnishes him one of the best indications he can have as to the way in which these pullets have laid during their first year of life.

His first selection should always, of course, be on the strength and constitutional vigor, but after having picked out the good strong, healthy birds he should then choose from among those the ones which show the whitest legs. Poultrymen often make a mistake on this point, frequently practicing just the opposite—that is, picking out carefully those which have yellow legs which are the poorest layers in the flock.

Feed Well and Wisely.

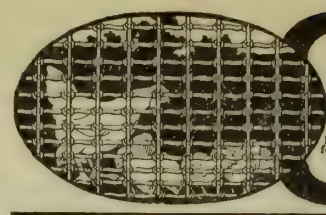
The need of feeding hens a well-balanced ration is shown by Missouri experiments. Four pens containing five hens each were treated just alike, except for the feed.

The test with a wide ration, containing elements which would produce three yolks for each white, laid 379 eggs in the first six months.

The test with a narrow ration, containing elements which would produce two whites to each yolk, produced 269 eggs.

The test with a ration containing equal yolk and white material, but without minerals to produce the shell, produced 161 eggs.

The test where the ration contained elements necessary to produce equally all parts of the egg, produced 1503



PEERLESS POULTRY FENCE
A Real Fence—Not Netting
Strongly made and closely spaced—making it a complete barrier against large animals as well as small poultry. Top and bottom wires No. 9—intermediates No. 12 wire—made by the Open Hearth process which time and other tests have proven to be the best. Send for catalog. Ask about our farm and ornamental fencing. Agencies nearly everywhere. Agents wanted in unassigned territory.

ROGERS FUR COMPANY, Dept. 332 St. Louis, Mo.

RED ROSE TEA "is good tea"

eggs in the same time. This ration is called a balanced ration for egg production.

The following ration is fairly well balanced for egg production: One-hundred and fifty pounds each of cracked corn and cracked wheat, 20 pounds each of wheat bran, middlings, corn meal, ground oats and gluten meal, 30 pounds beef scraps, five pounds each of alfalfa meal and old process linseen oil meal.

For hens having free range of the farm a very simple ration is made of equal parts cracked corn and cracked wheat and a dish of beef scraps to which they can help themselves.

Greater Scope.

(By Special Correspondent)

There is a tendency amongst Nova Scotians to discount their achievements. They do believe in themselves, are self-reliant, and originative. But they incline to doubt that the people of a small province have conceived and achieved big things. For instance, they took "with a grain of salt" the statement that in the new Science Hall of the College of Agriculture at Truro, the province possesses one of the finest educational buildings on the American continent. They thought the claim extravagant until convinced by the testimony of visitors from the other provinces and from the United States that in beauty of structure, serviceable allotment of space and equipment for study, demonstration and research, both in physical and in domestic science, this hall is unequalled in Canada and unsurpassed in the American republic. It is easy briefly to justify the eulogies of visitors and to show the imperative need of such a unique Science Hall in Nova Scotia.

A Noble Structure

This "noble building for a great purpose," as a distinguished American visitor signalized it, is set high on the central knoll of the College campus. It is 125 feet in length, 50 feet in depth, and three storeys in height. Its walls are of handmade "rustic" red brick, which has the effect of glinting forth soft tones and tints of color, in contrast with the hard plainness and monotony which would result from walls built of pressed or wire-cut brick. Further beauty is added, and monotony relieved, by the plinths, facings, and pillars of the facade or front elevation, which are of chiseled Wallace gray free stone. The stairway to the main entrance is constructed of free stone, and concrete, protected with fluted steel treads. Inside, the Hall is finished with dark-toned oak; the laboratory desks and experiment tables are also of oak; and the fixtures are mainly in brass. The colorful finish and fixtures, with the abundant play of sunlight upon their surfaces, makes a handsome interior appearance. Modern heating and "forced fresh air" systems conserve health, and make for mental efficiency.

The necessity for such a spacious building arose from two considerations. At the same time that the number of male students of scientific agriculture was increasing rapidly, the short-term courses in dairying, poultry husbandry and Domestic Science for farmers' wives and daughters and other ladies interested in Home Economics had increased also the number of female students. For both sexes of students were without adequate facilities for research in and demonstration in physical and domestic science. Unless such provision was made the college would fail in its mission to the people and thus pass as a modern educational institution. It was therefore wisely decided to erect a building which would afford ideal facilities for teaching and research in physical and domestic science.

Special Features

The women of the province have the unique distinction of having the whole of the top floor devoted to Domestic Science. On this floor are a spacious labaratory, desks, ranges, and otherhousehold apparatus and helps; also a room fitted wtih wash tubs and modern laundry apparatus. Fifty women can do practical work at the same time. But the striking room is the so-called Assembly Hall—spacious (50 feet by 45 feet), sunshiny and inviting, and fitted with movable furniture. Attached to it is a ladies' library and reading room. In the Assembly Hall will meet the various Women's Institutes. When not thus occupied, it will be used for practical work in domestic science and household arts. It allows no economic waste; for it is always adaptable and ready for some use in women's work.

On the ground floor are three private research laboratories—one for the chemist, one for the provincial entomologist, and the other for the investigator of plant pathology (diseases)—and a large class-room, capable of accommodating 160 students, but at present seated for only 80, so as to allow each student double space for lectures and laboratory experiments. The basement, which is essentially on the first floor, contains a general chemical laboratory, providing accommodation for 48 students working at the same time, and colset room in each desk for apparatus for four times that number. Also on this floor is another chemical laboratory, especially adapted for handling and experimenting with soils and fertilizers—materials that would spoil the cleanliness of the general laboratory. In addition, there are three dark-rooms for photograph-work, and two incubators for growing and experimetning with bacteria and plant disease organisms. There are protected rooms for storing chemicals. The men's lavatories are above the boiler rooms, which have been sunk below the basement, thus making the building consist of three full storeys. From every point of view, then,—beauty, and durability of structure, educational scope and utility—the Science Hall of the College of Agriculture is a noteworthy monument to the progressive spirit of Nova Scotians, and signalizes the dawn of a new epoch in the teaching of science in the little province that has given to Canada her greatest educationists.

Latest Move.

(Special Correspondence to Maritime Farmer.)

Cheap and durable underdrainage is the latest practical move the Nova Scotia Department of Agriculture is making to encourage better farming in the province. In addition to the traction ditcher, which has been in use for some years, the government has purchased and is operating a portable concrete-tile manufacturing machine, which has already proved to be of great service. Near Lyons Brook, Pictou county, where there exists a live interest in underdrainage, this machine, for the last two months, has been in commission amongst the farmers of that district, and has manufactured 31,000 tile, 3-nich to 8-inch sizes.

The use of the machine means several important advantages to farmers. They can manufacture filed tile on their own farms, if gravel and sand are readily obtainable. Moreover, it happens that in Nova Scotia most farmers are located at considerable distance from a tile manufacturing plant. This and the fact that the freight they have to pay on such a bulky article as tile, disinclines them from underdraining their farms, even though that underdrainage is essential to a large proportion of the lands in the province. But by use of the portable tile-making machine, farmers can not only use it on their own properties, but also employ their own labor in all the processes, and thus need not put up the spot cash which would be required from them by the tile plants and the railroads.

Then there is the co-operative advantage. The Department of Agriculture ships the machine to and from the centre or district that asks for its services, and also pays the travelling expenses of the operator. For their part, the farmers sign an agreement to manufacture not less than 20,000 tile for use in their district, and to unload and reload the machine at the centre railway station. In all this the farmers co-operate amongst themselves and with the government to the mutual advantage of all parties concerend.

RAW FURS

WE BUY THEM!

Thousands of satisfied shippers say we give good returns. Good reasons: we pay highest market price, give honest assortments and make quick returns. It will really pay you to ship to us. We charge no commissions and pay express and mail charges. Write for free price list and shipping tags sent to trappers and dealers only.

BENJAMIN DORMAN, Inc.

147 West 24th St. RAW FURS, GINSENG, GOLDEN SEAL New York

County Agricultural Representative Repays His Salary Several Times Over—An Outline of Some of His Activities.

Less than a year ago, the Departmetn of Agriculture of the Province of Nova Scottia appointed as their representative, to look after the agricultural interests of Antigonish County, Dr. Hugh McPherson. Since his appointment Dr. McPherson has actively devoted his attention to many lines of work calculated to advance the agricultural itnerests of his native county. Perhaps no more tangible line of work, capable of interpretation in terms of dollars and cents, has been carried on by Dr. McPherson than the co-operative marketing of wool which with the aid of H. L. Hewson of Amherst, he organized. Mr. Hewson, who has always been interested in promoting the sheep industry of the Maritime Provinces, has recently been giving attention under the Federal Department of Agriculture to the proper marketing of wool by the farmers. Dr. McPherson at once sought his assistance.

Commonly wool is washed and without being graded is sold to the retail store. In the process of washing and rolling all grades of the wool become more or less intermixed, and proper sorting is rendered very difficult. The best buyers prefer to get their fleeces unwashed and properly rolled so that they can sort the wool themselves. It was in this way that the Antigonish wool which Dr. McPherson assisted in marketting was prepared.

Altogether a little over 12,000 lbs. of wool was marketed under the co-operative association which Dr. McPherson organized. The average price realized for the unwashed wool was a shade better than 36c in comparison with from 36c to 38c for washed wool which was being paid by the ordinary trade, and when it is considered that wool shrinks from 25 to 50% in weight in the process of washing it will be observed that Dr. McPherson and Mr. Hewson thus realized about 10c per pound more for their wool than if they had sold it in the ordinary way, or in the aggregate rather more than $1200.

Another line of activity with which Dr. McPherson has identified himself has been in assisting farmers to buy their commercial fertilizer supplies co-operatively. Several carloads of those fertilizers recommended by Dr. McPherson were bought by farmers in Antigonish and Cape Breton counties last spring. One single Agricultural Societyt in Cape Breton by purchasing in this way saved $600, and other bodies of farmers saved correspond-ing amounts.

Now a short sighted view might make it appear that the money thus saved by co-operative buying and selling being lost to the retail trade. It did not represent such a large saving as appears on the face, but the facts are that when farmers can buy fertilizers more reasonably, and sell their goods more profitably, they purchase larger supplies, grow bigger crops, derive bigger returns from their farms and so add to the prosperity of the whole community in which they live. Ultimately every line of trade benefits from the prosperity of the farmer, and therefore every one, who is interested in the welfare of the country, is bound to indorse these lines of activity by which the farmers through organization are able to make bigger returns from their farms.

Besides these lines of work Dr. McPherson organized and carried on a short course in agriculture in the town of Antigonish last winter at which there was an average attendance at each session of something over 200 farmers. Also, he is carrying on experiments with various fertilizers on typical soils of the county which will form the basis for a still more intelligent system of fertilizing the land. Under his guiding hand, too, a seed centre constituted of farmers who are interested in growing seed of the highest quality on their own farms has been organized, and is already in an improvement of the character of farm crops on many farms, the subject of comment of every agriculturist who has had the opportunity to visit Antigonish of recent years.

Dr. McPherson is not alone in the work which he is carrying on, but has the backing of the county council, and the Board of Trade of Antigonish, both of which bodies gave handsome donations towards the erection of a Demonstration Building suitable for carrying on classes in agriculture and also containing the offices in which Dr. McPherson makes his headquarters.

A forward movement has certainly begun in earnest in Antigonish county. In addition to the various lines of work already described, two new creameries have been constructed in the outlying parts of the county within the past two years and there is an agitation for still further development along these lines. Antigonish county, which for years has made little if any progress, is now developing in earnest, and if it continues to progress, as it has for the past two years, is bound to take a foremost place among the counties of Nova Scotia. When some historian writes up the history of this wonderful growth he will find that not the least of the agencies which have led to the development has been the work of the county agricultural representative, Dr. Hugh McPherson.

When to Dig Seed Potatoes.

The prevailing opinion amongst growers regarding the condition the potato crop should be in when harvesting the tubers for seed is that the plants should be dead, or, as it is termed, quite ripe, and that the crop should not be lifted until a fall of rain has occurred. However, experiments for some years past in Great Britain show that seed dug in an immature state, while the plants are quite green, always give the best satisfactory yield.

FOR HOME AND COUNTRY

This Department is devoted to the best interests of the Homes of the Maritime Provinces. Contributors to these columns are leaders in the "For Home and Country" movement. This Department is yours. Use it to the best advantage by sending us timely suggestions, short articles dealing with your experiences, and reports of your Institute meetings.

The Homeville Cyclone

By Raymond Comstock.

The first gray days of November, with the chill frostiness of the air and the rustling of fallen brown leaves, were announcing the coming of winter. It was late in the afternoon. Down the dusky village street drifted the whitish pungent smoke of leaf fires, and before two or three doors the red ask glowed into the cool dampness of the falling night. Ned Malcolm and Cherry Gildersleeve came walking briskly along the path toward the square white Gildersleeve house.

"It is too bad, Ned," said Cherry for the twentieth time since she had met the lad before the post office. "I don't know where The Copper Circle can meet now, unless we begin having it 'round among the houses, and that soon breaks up the attendance. Why, oh, why, did that cross old Mr. Bascom have to come home and spoil our wonderful meeting place in the schoolhouse? Miss Heavens was perfectly willing to have us meet there, and it would have been fine this winter; but now Mr. Bascom has just spoiled everything."

Cherry's pretty red lips pouted in evidence of her dispelasure, and Ned dove his hands deeper into his pockets and scuffed up the dry leaves with his feet. He too was puzzling. The Cooper Circle, the social and good-fellowship club of the young people of Homeville had been turned out of its accustomed weekly meeting-place, the district school, and just then every member was wondering what they should do for a meeting-place, for the crowd of eager boys and girls that made up its membership. The club name had been the suggestion of Ned Malcolm, its president. Electricity is only of use for material purposes, when carried over a circuit of copper wire; what better name, then, for a circle in which the power of friendship was to form the warming and inspiring current, than The Copper Circle?

"Well," declared Ned pensively, "the schoolhouse wasn't any too good, anyway, you know, Cherry. What we ought to have is a regular club-house with a real library. Then, when we had our debates or parties, or when we wanted to spend a quiet afternoon reading, we could do it there. But I don't suppose there's much chance of our getting that for a while."

They had reached the white gate of the Gildersleeve home. In the darkness the red gleam of the fires glowed brightly along the street. The fragrance of the smoke and of the night dampness drifted to them. Cherry rested one arm on the gate and leaned back against the pickets, while the lad reached for the latch, in order to open it for her.

"That's just what I am thinking about, Ned," agreed the girl, not offering to go in. "We must have the library. You didn't know it, but I have been talking with several of the girls, and we all feel that there has been something missing in the spirit of our club. And I want to ask you what you think about it."

Cherry hesitated, wondering how the thing she was going to say would affect the boy, and not knowing just how to begin. But Ned Malcolm was waiting with the courtesy which had earned him the esteem of all his mates, and had caused them to choose him their leader. Besides, the sage suggestions of Cherry Gildersleeve had more than once proven the value of her clear little head.

"Go on, Cherry," invited the lad.

"It is this, Ned. We call ourselves The Copper Circle because we make a complete circuit for the current of friendship. But if we were really a copper circle through which electricity were running, and we were not connected with anything else, to give it the benefit of the electricity, we would be just waste copper. Current that goes round and round, without affecting anything but the wire through which it runs, isn't much good, is it? So we girls have thought that as a club we ought to have some outside purpose, some way of giving off electricity to make light or heat or something else for places where it is needed. And the libriary is the thing that is needed much more than anything else. If we could start a public library, so that such people as old Mehitable Matthews, and Danny Ellis, and the people out on the poor farm who have nothing to read, could get a book once in a while, wouldn't that be like sending out electric light to the people?"

Cherry clung tight to the gate with her gloved hand, and waited anxiously in the darkness to hear what the boy opposite her would say. Would he laugh at her idea She ought to have known Ned Malcolm better.

"It's a wonderful idea, Cherry!" he exclaimed. "It's simply wonderful! Nobody but a person with a big brain could have thought to make that clever simile about the electric lighting for this club of ours. You certainly ought to be the president instead of me. Now, all I ever think of is how to keep our club together and such things as that, while here you are conceiving a wonderful scheme for making us a really valuable part of the village. It's fine, and we'll push it ahead, even if we have no regular meeting-place. We're going to give off current." He was wildly enthusiastic, and the girl laughed delightedly.

"We'll meet at my house on Friday then, won't we, Ned?" she asked, as he opened the gate for her.

"Well, if your folks are willing," he agreed. "It's good of you to offer it. And goodnight, Cherry," he shook her hand, and tipped his hat. "It's a wonderful idea."

"Good night," she laughed happily, and ran lightly up the path. On the veranda she paused. From down the street she could hear his merry whistle and the scuff-scuff of his feet among the leaves.

"We're going to give off current," she murmurred. "We are going to give forth light in Homeville." She went into the warm lamp-lighted sitting-room.

* * * * * *

It was half past ten that evening when Cynthia Heavens, the young teacher of the district school, shut the book she had been studying and arose with a sigh to go to bed. The book was an old psychology, for Miss Heavens, in spite of the prolongation of her term at the Homeville school from year to year, still dreamed of the college education and the bigger achievement in the outside world, which had inspired her early girlhood. At thirty, with the first flush of youth subsiding into the softer complexion of established womanhood, she still looked forward with girlish ambition to that sometime-to-come great day when she should go forth, an admitted scholar and leader, from the portals of a great university.

For thirty years Cynthia Heavens had dreamed; ten of those years she had waited as teacher of the Homeville school. At last, at the end of the present school year, she would be sufficiently on her feet, with no dear ones longer to provide for, and with no more old debts of theirs to hamper, to make the start of which she had dreamed. The end of the present school year, June, and it was November now. She went to the door of her little cottage to peer out at the brisk, frosty night, opened it, and stepped out on the porch. The stars gleamed cold and white in the wark sky. How quiet it was! Then she started and listened intently.

From below came a faint cry, the pitiful wail of a baby. It was at her feet. She bent to look, and discovered a tiny bundle lying half-hidden beneath a bare lilac bush close to the porch. Trembling with anticipation the girl hastily pushed back the twigs, and gently, ever so gently, raised the little bundle from its position among the rustling leaves. For a moment she sttared down upon it unbelievingly; then, obeying the instinct of her sex, she pressed it close to her breast, and hurried into the warmly lighted sitting-room.

But once within, Cynthia Heavens knew not how to act. A baby! In her care! What should she do with it? Whence had it come? Wondering, she undid the blanket and gazed on the wee pink face and the staring blue eyes of her night find. One look was enough. The hungry heart of the lonely teacher leaped out to this morsel of humanity that had come upon her hospitality, and she caught the baby to her breast and pressed the tiny face with her lips, while hot tears slowly trickled down cheeks that had not known tears for many months.

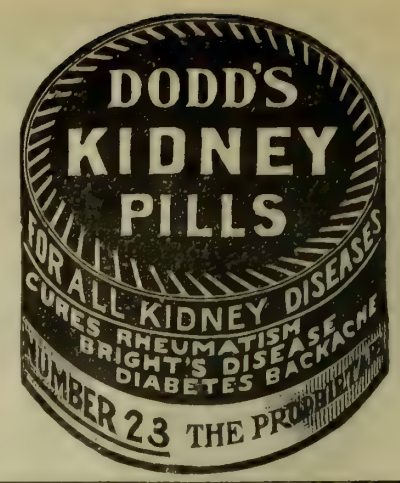
"Oh!" she wept quietly. "You darling! You little breath of love from the skies! I don't know where you have come from, but I want you. Oh, I want you so much, to keep you here with me!"

Again and again she kissed the little face. Then action supplanted adoration; she hurried to the closet for milk, and began to heat it over the fire. And as she did so she talked alternatively to herself, as she was accustomed to do, and to the baby on her arm.

"It'll be a racket in the village if they learn I'm going to keep you, you little darling. They'll all be going wild with the thought that a real mystery has come to Homeville." She kissed the bay tenderly, and stirred the milk. "You'll set them all whirling like a Kansas cyclone. A regular cyclone coming to our village, you baby from the night. I wonder if God just let you fall from the sky, like the leaves falling from the trees. And what shall I call you, little cyclone? Cyclone? Cy, or shall it be Sigh? A sigh from the angels for lonely me."

Tenderly she cared for the little one; gently she prepared it for its sleep; and when at last Cynthia Heavens closed her eyes in slumber that night it was with one hand resting protectingly on the arm of the big rocker, which formed the little foundling's improvised cradle.

Perhaps, had the warm-hearted teacher known how great a cyclone she was harboring in the adoption of the little foundling, she might not have slept so easily that night. Homeville buzzed like a hornet's nest the next day. The gossips of the village talked from dawn until dark; ere nightfall of the following day, Miss



MOTHER OF SCHOOL GIRL

Tells How Lydia E. Pinkham's Vegetable Compound Restored Her Daughter's Health.

Plover, Iowa.—"From a small child my 13 year old daughter had female weakness. I spoke to three doctors about it and they did not help her any. Lydia E. Pinkham's Vegetable Compound had been of great benefit to me, so I decided to have her give it a trial. She has taken five bottles of the Vegetable Compound according to directions on the bottle and she is cured of this trouble. She was all run down when she started taking the Compound and her periods did not come right. She was so poorly and weak that I often had to help her dress herself, but now she is regular and is growing strong and healthy."—Mrs. MARTIN HELVIG, Plover, Iowa.

Hundreds of such letters expressing gratitude for the good Lydia E. Pinkham's Vegetable Compound has accomplished are constantly being received, proving the reliability of this grand old remedy.

If you are ill do not drag along and continue to suffer day in and day out but at once take Lydia E. Pinkham's Vegetable Compound, a woman's remedy for woman's ills.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box 309, Windsor, Ont.

Heavens had received calls from a large part of the population of the little place, and from not one, but nearly all had come some form of advice.

One would have thought that this would have been in the form of kindly suggestion; instead it was chiefly in warning as to the foolhardiness of her decision to keep the waif. She could not do that and her teaching too; she would end in the poorhouse, where the baby should be sent, and she would become a public charge. To this prediction the teacher replied; to most of the advisers she had but a polite "thank you," that might have meant agreement or not. But that she would become a public charge, she declared, was her lookout, and when that time drew near, she would value more sincerely such suggestions. Meanwhile the baby stayed, unless its rightful guardian appeared to claim it.

But the climax came with the visit of Mr. Bascom, the head of the school trustees. Short of speech and irascible as usual, he came just at nightfall, and in the lamplight, the girl greeted him. His reply to her invitation was a growl; he came into the sitting-room as if he owned it, for was it not through his acquiescence that the teacher held her position Laying his hat on the table and turning to her, he put his question abruptly.

"Look here, Miss Heavens. What's this I hear about you adoptin' a baby? What's the truth of it?"

Cynthia Heavens turned a little pale, but her lips were pressed determinedly together, as she put down the lamp and turned to her visitor.

"That is the truth, Mr. Bascom." she informed him quietly. "The baby was left on my porch, and I am going to keep him."

"Well, you can't." Jared Bascom's words were short. "You take him to the poor-farm tomorrow. That's the place for picked-up babies; and not in the charge of school teachers." He picked up his hat and turned as if to go, but the girl stepped forward.

"Mr. Bascom, I am not going to take him to the poor-farm. He is mine now, and I am going to keep him. I don't see why you should interfere with me in this."

"You don't!" The irascible old man was dumbfounded at the audacity of the teacher in refusing to obey him. "You don't! Who am I, anyway? Didn't I tell you that you was to? Ain't I the head of the school committee? You take that baby over there, or I'll turn you out to starve. D'ye hear me?"

Cynthia Heavens turned white. To lose the school position on this, the final year| To be turned out now! She saw her dream of the university fading away in the dim distance; she saw visions of herself homeless during the winter. It was not worth it; she must yield. Then from the next room came a little wailing cry. The old man started at the sound, but his eyes came back fiercely on the slim pale woman before him. It was a call from the heart of the baby to the heart of the woman. Cynthia Heavens did not waver now.

"Mr. Bascom," she said smoothly, determinedly, "you may have been able to turn out your own boy, because he married the girl he loved. You may be able to feel that he is struggling along by himself heaven only knows where, without your backing and your blessing. You may be able to dispossess poor old Mehitable Matthews and still not have your conscience spoil your sleep. But if you send that little helpless baby into the public poorhouse, I hope you will never sleep again. And if you insist on my giving him up" (the scowling gray old head nodded insistently), "then I tell you I won't. And you can discharge me whenever you please. If there is a God to protect the birds of the air, he will care for me and this tiny baby. Now, good night! I don't want you in my house."

Picking up the lamp, her face white and her breath coming in little sobs, she went quickly to the door and held it open. Trembling with fury at the defiance of this insubordinate teacher, and stung by her reference to his disinherited son, Jared Bascom stamped out. On the porch he stopped to point a threatening finger at her.

"You wait till the cold weather comes on!" he exclaimed; but the door swung to, leaving him in the darkness. Inside a pale-faced woman hurried into the back room and clasped a tiny bundle in her arms.

"Darling baby," she whispered. "My little Cyclone, from out of the darkness. May you never know what you have cost me tonight."

* * * * * *

"Ned! Ned! What you you think that cruel old Mr. Bascom has done " exclaimed Cherry Gildersleeve, as she greeted the president of The Copper Circle on his arrival at her home for the meeting on Friday evening. "Father has just told me that Mr. Bascom has discharged Miss Heavens for keeping the little found baby. Oh, I think he is cruel. She has no way of supporting herself now, and the winter is coming on. And father says that Mr. Bascom was perfectly furious with her for daring to keep the baby, when he had ordered her to put it in the poor-farm. He said that it would interfere with her [illegible] but I think it is because he is just too mean to see anybody happy. I don't wonder his own son married and went away from home."

Ned Malcolm listened quietly to the story from the lips of the pretty lass, but his dark eyes flashed indignantly.

Exceptional Piano Offer
Extraordinary Values

The list of bargains offered in this advertisement represent such exceptional value that it is impossible to offer better terms of sale than those announced, the prices being quoted low enough to produce cash or nearly cash results. Never before in the history of this house have we known of such extraordinary values as this special sale affords.

A careful reading of the description of the pianos and the terms of sale, will make it quite apparent that immediate action should be taken. Most instruments have had some use, but every instrument leaves our ware-rooms in perfect condition, and comes with our guaranteed.

TERMS

The Terms are as follows :

(1) One-third cash; one-third in one year with time note bearing 7% interest; one-third in two years with time note bearing 7% interest.

(2) $10.00 discount for one-half cash, other half in one year.

(3) $20.00 discount for all cash.

Sick Children Made Well

Every mother likes to see her children the picture of healty and vitality.

Trade Mark

I find that the stomach is a source of constant trouble to some children, and there is a constant need of some safe remedy. A disordered stomach, too, frequently breeds worms, either stomach worms or pinworms.

You can absolutely depend upon Dr. True's Elixer to expel worms and tone up the stomach, bowels and general health.

Dr. True's Elixer has been on the market for over sixty years. That's proof of its efficiency. Get the time-tried Dr. True's Elixer, the Family Laxative and Worm Expeller. Good for adults also. At your dealers, 35c, 50c and $1.00. Advice free. Special treatment for tapeworms. Send for book.

Knowlton, Que. Dr. True

That was too cruel, too unchristian. He felt that the old man deserved condemnation, but the boy had learned to withhold judgment, as few mature persons learn. Quickly he thought over the conditions. The teacher was giving up her position for a principle of Christian kindliness, trusting that she would be cared for. Like a flash of inspiration from above came the knowledge of what he should reply.

"It does seem cruel, Cherry," he admitted quietly. "And surely Mr. Bascom will not be half as happy over it as Miss Heavens, whom he has wronged. But maybe this is going to offer up our first chance to give off current. It's going to be a cold winter, and a little electricity ought to be welcome to Miss Heavens."

"O Ned, Ned! What a wonderful idea!" gasped Cherry admiringly.

So, when the members of The Copper Circle came together there a few minutes later, Ned Malcolm called upon Cherry to tell them of her idea about the copper-carrying current to some place where it was needed, and then to describe to them the scheme to aid the teacher. With the warmth and generosity that is characteristic of young people, they agreed enthusiastically to the idea, and plans were made for a systematic care of the brave young teacher and her little adopted ward.

It was decided that the different girls should take turns in dropping in to see and show their friendship to the teacher, to aid her in any way they could. To the boys fell the heavier duty of seeing that a supply of cut wood always lay ready for use in the shed behind Miss Heavens' cottage, and that the basket of necessary food appeared at regular intervals on top of the wood. And all this was to be done without a word or an explanation to the teacher herself.

That night, with hearts that beat happily in the joy of anticipated service, and with a longing to begin their mission of giving forth a light and warmth through their current, the members of The Copper Circle went through the dark streets to their homes. And during the ensuing week such a change in various sons and daughters was apparent to the mothers and fathers of Homeville, such thriftiness, such an eagerness to turn their hands to anything that might earn a few pennies in return that the grown-ups watched in wonderment.

"And when the first basket was packed, and into it was slipped a little home-made linen bag containing five dollars in bright nickels, dimes and quarters, such a thrill of happiness radiated through the group, as no current of internal friendship had ever given them.

"Why!" exclaimed Cherry happily. "There's a lot more electricity in the wire when its giving off current, than when it is keeping it all for itself." That was a bit of the greatest philosophy that Cherry had uttered, the secret of the world's happiness and contentment.

Then a note with the message: "For the little Cyclone, by electric wire," was laid on top of the goods, and the whole covered tightly. Two of the boys stole quietly from the house to carry the gift to the woodshed behind the little cottage, while the rest of the Circle crowded to the windows to watch them on their way across the silver-lighted fields.

A month passed. The year was drawing to a close under a deep mantle of white; the weather was crisply cold, until the horses' hoofs squeaked and the sleigh-runners ground in the powdery hard snow; and jingling bells sang the song of winter on the frosty air. One evening the cyclone baby lay snug and warm in its little homemade cradle, while Cynthia Heavens sewed in the grateful warmth of a tall heating-stove, and hummed to herself with a happiness that was greater than any she had ever before known. Miraculously it seemed, she had been provided for. Her faith had been rewarded fully; her assurance as to the future was unlimited.

From outside in the darkness came the jingling of a fast-driven sleigh, a loud "whoa," and the crunching of footsteps on the path leading to her door. A knock sounded. She arose, laid down the sewing, and, lamp in hand, opened the door to behold Jared Bascom, muffled to the ears against the biting cold and with him a tall young man, a slim, pretty little woman. Cynthia Heavens stepped back in surprise.

"Won't—won't you come in?" she asked.

The three came in, stamping the snow from their shoes; the young man took off his hat and muffler, and the teacher started in surprise.

"Joe Bascom!" she exclaimed.

He came forward, his hand held out.

"Yes, Cynthia, it is I. And this is my wife." The pretty little woman came forward and held out her hand which shook as if with excitement. "We have come on a strange errand, Cynthia, and because we owe you a great debt. You did not know it, but you have done us a great ——"

From the next room came the faint wailing cry of the baby. Pretty little Mrs. Bascom started and trembled violently.

"O my baby! My baby!" she whispered, and ran into the back room. Hastily they followed—the young father eagerly, Cynthia Heavens with mingled feelings, old Mr. Bascom nervously, his hat crumpling and opening in the clasp of his wrinkled hand. There was the little mother, her baby held close to her breast, while her tears fell fast upon the little one. "O baby! My baby!" she was sobbing happily.

For a few minutes there could be no explanations, and the teacher, who was torn between her love for the baby and her joy in the joy of its mother, strove in vain to find out the story of its coming to her. At last the young father released his family from his arms long enough to explain, turned to his little wife. "Tell her, dear, how much we owe her," he said, gently.

For a moment the pretty woman tried to speak. Then, words failing her, she threw her arms about the neck of Cynthia Heavens and wept her happiness out upon her shoulder. Tenderly the teacher kissed the little mother.

"I shall always feel that little Cyclone is part mine," she whispered, with a touch of forlornness.

The Syrup of a Hundred Uses

Of course, "Crown Brand" is your favorite Table Syrup. Of course, you enjoy its delicious, appetizing flavor with *Bread, Pancakes and Hot Biscuits.*

But what about "Crown Brand" in the kitchen? Do you use

EDWARDSBURG "CROWN BRAND" CORN SYRUP

for Gingerbread, Cookies, Cakes, Pies and Sweet Sauces for all kinds of Puddings?
Do you always use it for *Candy-making*?
Try it in all these ways. You'll find "Crown Brand" Corn Syrup handy, convenient, economical, dependable, good.

"LILY WHITE" is just what its name implies—a clear corn syrup—more delicate in flavor than "Crown Brand", that is equally good for the table and for candy-making.

ASK YOUR GROCER—IN 2, 5, 10 AND 20 POUND TINS.

When writing advertisers please mention the Farmer

"It was through a mistake," he said. They had meant to kidnap the baby of the wealthy man for whom I work, and they got our little one instead Then they left it here, which by chance was so near to my old home. Yesterday a note reached me stating that a mistake had been made, and that if I wanted my baby, I could find it with you. That is all, Cynthia." He

There was a husky cough from behind.

"Er—er, Miss Heavens," broke in the old man. "I—er—owe ye an apology that I can't tell in words, for this that ye have done for me and my boy. Joe here, he's coming home to live with me now, and it's through you that he's coming in this direction. Besides," the pride of the old man stubbornly insisted, "my grandboy 'd ha' been in the poor-farm if it hadn't been for you. There ain't much I can say for myself about this now, but I'm going to make up to ye for taking away your position in the district school." The old man paused a moment, scratching his head thoughtfully while the teacher waited in embarrassed silence. "I ain't exactly what ye'd call a poor man, Miss Heavens, and I been figuring that maybe I could make it up to ye in part by putting some cash in the bank in your name. Would a thousand dollars seem to cover your loss and kind of make ye feel a little friendlier towa'd me?"

Cynthia Heavens gasped. That did not seem right; it was too much. She had only done what seemed to her her duty. But Joe Bascom intervened then.

"You must take it, Cynthia. It's partially from us, too, and I know what you have been wanting to do ever since you came here to Homeville. This is a means to the university work, and it helps dad to feel a little easier in the matter."

"But," protested Cynthia, "I have not done all. Someone else has saved both the baby and me from the poor-farm. It has come every night, wood or food or money, always to keep us alive."

"'It' has come?" echoed the others. "Who? How?"

There was a bang from the shed behind the house, a series of heavy bumps, and a little scream of fright in a woman's voice. All started. Quickly Joe Bascom sprang through the door and out toward the shed. Voices from without arose in protest, girls' voices and those of boys. A moment later they came into the entrance, Joe Bascom clasping two lads by the arms and marching them in, protesting, while behind came two of the girls

Once within, the tall young man released his hold on the lads' arms, and stepped back from them.

"Now," said Joe Bascom, "tell us what you were doing in Miss Heavens' woodshed."

But the teacher came forward.

"It is clear now; don't you see, Joe They are the ones who have been bringing me the things." She turned to Cherry Gildersleeve. "You are, aren't you, Cherry?"

Cherry, blushing prettily, nodded.

"Not just we, Miss Heavens. It was The Copper Circle. Tonight the sawhorse tumbled down from the pile and spilled all the wood, and I screamed, and now—now it's all out." She paused ruefully, looking at each of her companions and then at the gathered group.

Joe Bascom came forward

"Tell us more about this Copper Circle, Cherry," he suggested.

Simply the girl told; of their idea of giving off current; of their original plan of starting a public library in the town; how they had discovered the need to help the "little Cyclone"; and how they had carried out their scheme from week to week. Intently they listened, and before she had finished Cynthia Heavens was crying quietly, and old man Bascom was blowing his nose profusely and frequently. But when she stopped, he spoke:

"That idea about the library is mighty good, Miss Gildersleeve, and you and the others in The Copper Circle had jest better plan on starting it right off. I cal'late I know where the money's coming rrom. And sometime next week you drop in to see me and Joe, Ned Malcolm. I want to talk to ye about fixing up some kind of a place where this Copper Circle of yours can take care of its library. Mebbe the people here in Homeville think that old Jared Bascom is a close one, but he ain't when he sees something worth while to put his earnin's into."

"Ned " exclaimed Cherry impulsively. "Think of it. Our dream is coming true."

"We will all be very grateful to you, sir," Ned assured him quietly. "And believe me, sir, you'll find it's a good investment. Those things always come back, sir, and this time it will come in the respect of our young people. Good night, everyone."

Together the four went out and trudged across the snowy fields under a white full moon toward their homes. The next morning they learned of the finding of the "little Cyclone's" parents. And today in Homeville stands a neat club-house on the main street near the post office. If you should read the copper inscription over the door, you would see these words:

"THE COPPER CIRCLE
'Let your light so shine before men '"
—Young People.

PALPITATION
OF THE
HEART.

Sudden fright or emotion may cause a momentary arrest of the heart's action, or some excitement or apprehension may set up a rapid action of the heart thereby causing palpitation.

Palpitation, again, is often the result of digestive disorders arising from the stomach, or may be the result of over indulgence of tobacco or alcoholic drinks.

The only way to regulate this serious heart trouble is to use Milburn's Heart and Nerve Pills.

Mrs. J. S. Nicholls, Listowell, Ont., writes: "I was weak and run down, my heart would palpitate and I would take weak and dizzy spells. A friend advised me to try Milburn's Heart and Nerve Pills, so I started at once to use them, and found that I felt much stronger. I cannot praise your medicine too highly, for it has done me a world of good."

Milburn's Heart and Nerve Pills are 50c per box, 3 boxes for $1.25; at all dealers, or mailed direct by The T. Milburn Co., Limited, Toronto, Ont.

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. Applicant must appear in person at the Dominion Lands Agency or Sub-Agency for the District Entry by proxy may be made at any Dominion Lands Agency (but not Sub-Agency), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions A habitable house is required except where residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead. Price $3. 0 per acre.

Duties—Six months residence in each of three years after earning homestead patent; also 50 acres extra cultivation. Pre-emption patent may be obtained as soon as homestead patent on certain conditions.

A settler who has exhausted his homestead right may take a purchased homestead in certain districts. Price $3.00 per acre. Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land. Live stock may be substituted for cultivation under certain conditions. W. W. COREY, C. M. G.

Home Remedies.

Hot water and salt are very effective home remedies. A sudden sore throat will disappear rapidly if hot water cloths are wrapped around the neck, and a swallow of hot water, held in the mouth for a few seconds, will often relieve a sick headache. A nervous headache is relieved by applying hot water cloths to the soles of the feet and back of the neck. The patient should be kept quiet and allowed to sleep if possible.

The earache and toothache being the result of a cold, keep the patient in a comfortable position near a fire and allow him to sleep. In using hot applications, always remember to change them frequently, keeping them hot, for if allowed to become cold, they will do more harm than good.

Warm salt water held in the mouth will stem the flow of blood after a tooth has been drawn, and will often cure toothache. It is a good gargle for sore throat or hoarseness, and if drawn up into the nasal cavity will prevent the development of catarrh.

Tepid water and salt make a good emetic for one who has taken poison. Small doses of salt taken at intervals will relieve hemorrhage, and nose bleed may often be stopped by bathing the face and neck in cold salt water.

Always salt nuts well before giving them to the children to eat, as this makes them more palatable and digestible and prevents colic that is often caused by eating nuts. A half teaspoonful of salt will relieve this colic, causing the nuts to assimilate with the other food and digest.

Bathing the feet in warm salt water and then rubbing them with dry salt will avert a cold after getting one's feet wet. A salt bath is a good and bracing tonic.

The Japanese use salt as a dentifrice and have very firm, white teeth. It hardens the gums and keep them in a healthy condition. There are really no more simple or affective remedies than salt and water for many of the little ills that flesh is heir to.

When dry heat and the hot water bottle fail to remove rheumatic twinges, wring flannel out of hot salt water and apply to the affected parts. If the ear is filled with warm water and then after allowing the water to run out, plugged with a little cotton that has been dipped in olive oil or glycerine, it will usually cure ,the most stubborn case.

Health.

Bedtime.—It should be unnecessary to remark that no baby should be rocked or "patted" to sleep; at the same time, old prejudices die hard, and many young mothers fall victims to a pretty idea, and start hushing off their little ones when bedtime comes. It is, however, a wrong beginning to make, for once the habit if formed it is exceedingly difficult to break. and many hours of fretful wakefulness for the baby and nerve-racking irritation for nurse or mother are being laid in store. The baby should be laid down warm and dry, with every care to each detail of its comfort, well fed, and shaded from any light, even from the first day, and so accustomed to go to sleep unheeded and unrocked. Sometimes it will be awakened suddenly—possibly by some noise or exterior influence, possibly for a cause which cannot be determined; do not immediately take the child up, even if it is crying, but simply turn it over in its cot, soothing it with soft words as you do so, and giving it a teaspoon or so of cold water if it appears hungry. This simple process, carried on in the dark, or in the same subdued light which obtained before, will in ninety-nine cases out of a hundred induce the little one to go straight off to sleep again.

Of course, a baby should be laid to sleep on its side, in alternate positions each night, and care should be taken that the little ear is laid flat and not crumbled. Odly enough, people are far more careless than one would think possible about this matter, and

Firebox linings are extra heavy McClary Semi-Steel; best material for the purpose.

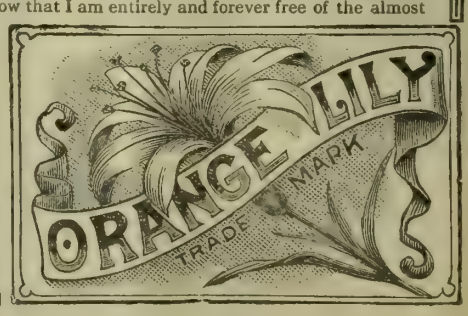
"Orange Lily"—the woman's friend—will transform your life!

If you are of that numberless host of women who silently suffer untold distress and agonizing pains caused by obstinate and long-standing disorders of an internal nature, let me make you this free and open promise—"Orange Lily" will transform your life!

I know the symptoms as well as yourself, for I too suffered for years before the discovery of "Orange Lily" home treatment. Now that I am entirely and forever free of the almost unendurable distress and pain of former years, I am only too glad to help others. "Orange Lily" is a local treatment that you apply yourself, without help, in your own home. A few days will work wonders and, like hundreds of others, you'll thank me for making known the good news to you.



Write me to-day and let me send you ten days' treatment of "Orange Lily"—absolutely free. It may save you from fatal complications later. When you are free from present troubles just tell others, that is all I ask. Address in full confidence Mrs. Frances E. Currah, Windsor, Ont. 12

undoubtedly many children owe protruding ears in later life to such carelessness in infancy.

Early Hours—Just a word must be said in conclusion on the importance of early hours. Six o'clock is a good bedtime for little children, certainly until they are six years old, and from then until they are ten the hours should gradually lengthen out until eight o'clock. There will be far fewer cases of nerve strain in school days, of irritability and fretfulness, even of indigestion, if such wise counsels prevailed in practice as generally as they do in theory.—Queen.

Rusting of Iron.

Rusting of iron and steel is natural and unpreventable, but it can be retarded in its rapidity of formation. On exposure to the weather iron combines with oxygen in the air and rust is formed.

Water (either as liquid or vapor) and oxygen must be present. Rusting is not merely the simple union of iron and oxygen but rust is the result of complex actions between iron, water, substances dissolved in water, as soil, dust, etc., impurities in the iron, ettc. In the changes occurring there are formed small electric currents between particles of the iron and of the other substances and oxide of iron results.

Some substances hasten rusting and others retard it. Those which aid are materials of an acid nature. Some forms of iron do not rust as readily as others. An iron which is worked well in its making and which is comparatively pure is especially resistant to rusting. Substances of an alkaline nature, such as quick lime, soda, potash, often inhibit rusting. A solution of potassium dichromate is especially good.—Raymond Hertwig.

The Round Table.

Keeping Meat.—In reply to the inquiry as to how to keep fresh meat during the summer, I would like to tell how many western people manage. We cut the fresh pork in slices, fry it in deep fat until thoroughly heated through. It should be cooked about half done, not less. Put a layer of fat in the bottom of a good clean sweet lard can. Put the slices in, then another layer of fat and meat, etc, until the can is full or your meat used up. Cover the top with fat and put on cover. Keep in a cool cellar. I have also tried quart pails with covers. Beef and chicken may also be kept in this same way. The thing to avoid is air spaces. A little bubble of air will start decomposition and spoil the whole.—M. E. A.

Treatment of Burns.

A physician writes: Free use of soft soap upon a fresh burn will remove the fire from the flesh in less time than it takes to write these words. If the burn be severe, after relief from the pain use linseed oil, and then sift upon it wheat flour. When this is dried hard, repeat the oil and flour until a complete covering is obtained. Let this dry until it falls off, and a new skin will be formed without a scar. This treatment leaves nothing more to be desired.

In most all processes of bleaching, an acid is formed which will weaken the fibers of the cloth, and, if very strong will destroy them unless quickly neutralized by an alkali. Ammonia or washing soda solution are the best to use for this purpose.

A Coal and Wood Range with a HIGH OVEN

Patented in Canada

Not a Gas Range

MOTHER too often sits down to the meal she has prepared too tired to enjoy it. Happy—but oh so weary!

Stooping constantly to attend the oven—to watch the roast the pies, the cakes! It's a back-breaking task. Yet baking need not be wearisome. This new coal and wood range makes it what it always should have been, the most interesting part of housework. It has so many ways of lightening housework that we have changed its name from the High-Oven Peninsular to the

LIGHTER DAY HIGH OVEN RANGE

6 pot holes—4 outside and 2 inside—cooking odors cannot escape

What a difference to have Lighter Day in the Kitchen

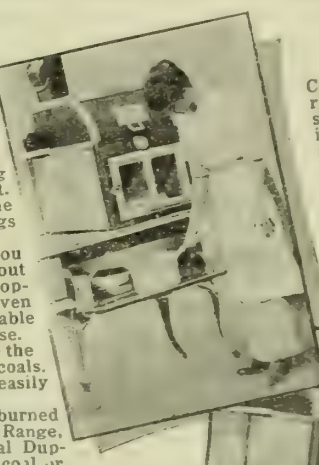
Never to stoop to do your baking! No lifting up and down of hot, heavy pans! The High Oven makes all the difference between "weariness" and "pleasure" in baking. Everything that used to tire a woman's back is changed in the wonderful High Oven Range

The thermometer and cooking chart meet you at standing height. The warming closet is just above the oven—and it is heated so that things are kept piping hot.

The oven door is clear glass—You can watch your baking, without opening the door—and without stooping. There are pot-holes in the oven and in the warming closet. Vegetable odors need never get into the house.

You have a toasting lever to raise the whole section of the top over the coals. You have grates that shake down easily and without sticking.

Extra long pieces of wood can be burned in the LIGHTER-DAY High Oven Range. It has a 26-inch fire-box. Or special Duplex reversible grate, for either coal or wood can be supplied.

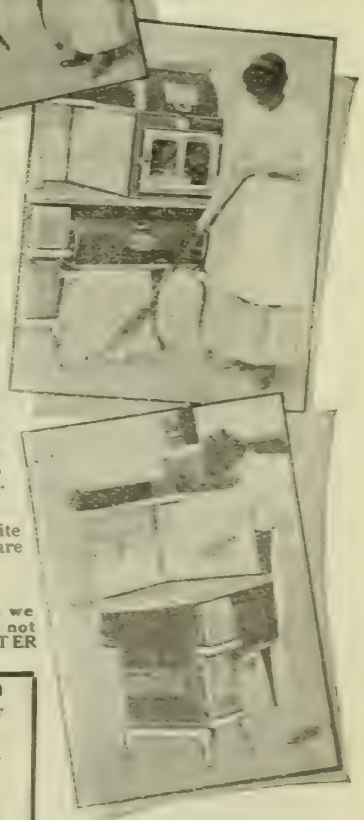


Handy Storage for Pans

Cooking utensils are kept right at hand and out of sight. This storage closet is heated and can be used as a big warming closet.

Clear Sweeping Space

It's so easy to clean the floor under the Lighter Day, as under the table.



You could hardly imagine an oven that heats so quickly. The reason is simple—there is no heat wasted waiting for the fire to "burn up." The oven starts to heat as soon as the kindling is lit.

So the lighter day makes lighter coal bills.

THE PHOTOGRAPHER TELLS THE STORY Wouldn't you like to see a Lighter Day Range? Every day more stores are ordering Lighter Day Ranges but if you want to see the range right away, if you want to see how your own work can be lightened—we will send you a wonderful little book. The photographer made this book. He took pictures of a woman using the Lighter Day Range, and really it's almost as good as seeing the range yourself. **Let us send you this little book and if you have a friend who thinks as you do in planning for "A Lighter Day in the Kitchen," write her name on the coupon, too. Just mail the coupon to-day, so you won't forget.**

Porcelain Enamel or Tile

You may choose a finish of either beautiful tile or white porcelain enamel. Both styles are handsome and are so easy to keep clean, and, of course, cannot rust.

READ THIS GUARANTEE

In the fifty-eight years we have been making ranges we have never expected a woman to keep one that did not give perfect satisfaction. We guarantee THE LIGHTER DAY High-Oven Range unconditionally.

Behind the Times.

(Continued from Page 44)

in question was the champion Holstein cow of the fair but the owner was more or less of a wag and to have a joke with the inquirer, who, by the way, we have since learned, was a graduate of the New Brunswick Normal School, volunteered the information that the cow was a White Leghorn. The prospective school teacher went away perfectly satisfied that he had learned to recognize the White Leghorn breed. This is only one of the many instances of the woeful ignorance that exists regarding the common things that surround us.

So far as the Maritime Farmer is concerned, we have no hesitation in saying that it would be a regretable fact if Nature Study which now occupies such an important part in the curriculum of the schools of the province were interfered with by teachers who are not broad minded enough to see its value or who have not prepared themselves to teach it.

In regard to behind-the-times teachers and educational leaders who side with their views we would say that the Department of Education can do better without them and their services than the boys and girls of New Brunswick can do without the opportunity to acquire a knowledge of Nature through its study in our schools.

What says Mr. E. S. Carter, the chief Superintendent of Education of the Province about the matter? At a meeting of the Kings-Queens Teachers' Institute held in Hampton last week, the Chief Superintendent said in part:

"More than 80 per cent. of the people of the Maritime Provinces live outside the cities and towns, and the great majority of these are engaged in agriculture. It is most necessary therefore to give such bent to our educational facilities that the needs of our most important industry and interests should be catered to and supplied. To this end the Agricultural Department of this Province is bending its energies and the Education Department is heartily co-operating.

"The Course of Instruction in Elementary Agriculture, which has recently been criticized in resolutions published in the press, has had the approval of the text book committee, all teachers have been invited to criticize it in their annual reports to the Inspectors, and the Director has offered to visit any locality to hear and take into account any suggestions for its improvement or amendment.

"Up to this time no formal complaint as to the Course has been made to the Education Department.

"It is not claimed that this or any Course is perfect, new machinery is likely to creak until it becomes adjusted. If it is not wholly adapted to the work of city grades, and this can be demonstrated,—it is not like the laws of the Medes and Persians, it can be changed, but constructive criticism rather than destructive, will be necessary to bring this about, and we wish to meet suggestions fairly and frankly made. The educational ends to be sought from the Course are quite as important to city children as to those living in the country, the facilities for acquiring may not be so good in the cities.

"The subject is too important a one to be lightly turned aside by those who will not take pains to acquire the knowledge requisite to teach it, or those who are averse to more work, or reactionaries.

"Agriculture is a subject which will continue to occupy more and more of our attention in the schools of this Province, and it behooves all engaged in the work of education to prepare for the demands which will surely be made upon them."

Mr. Carter has the support of the best thinking class of people of the province in his stand on this matter. He speaks in no uncertain sound. The last paargraph of his address sounds of the note "Prepare or Beware."

Everybody wants to bake—when the

REGAL FLOUR

barrel is opened.

The Yarmouth County Exhibition.

(Continued from page 45.)

plums, pears and peaches. J. M. Porter and J. L. Gavel had collections of 50 varieties. There were 6 collections of 20 varieties, prizes going to Alf. Hamilton and J. M. Porter; 4 collections of 10 each, prize winners, J. M. Porter, Ira L. Gavel and many collections of smaller or special groups, besides the individual exhibits, and apples in boxes and barrels. Other prize winners being Moses Crosby, Robert Gavel, N. P. Crosby, Wm. Porter, Jesse Moses, Adolph Wood, Chas. E. Pitman and Ralph Porter.

Some fine exhibits of grapes grown under glass were shown by Dr. J. M. Lovitt, Asa K. Crosby and Mrs. Don Can, as well as a plate of peaches, under glass, by W. R. Campbell.

Peck exhibits of cranberries won prizes as follows: Large oval, Mrs. W. Hammond; upland, Geo. W. Pitman; small red, Jenette Pitman; spiced grey, Mrs. W. D. Porter.

The exhibits of bread, preserves, cakes, and pickles looked wholesome, attractive and toothsome. The exhibit was large and competition keen. The male sex, especially the small boy looked at it wistfully and devouringly. The prizes should be larger if merit and importance count. Prize winners include Miss Maude Raymond, Clifford R. Kelley, Mrs. G. I. Allen, Mrs. Adolph Corning, Mrs. Moses Crosby, Mrs. Henry Burrill, Mrs. W. O. Porter, Miss Vera Porter, Mrs. Edw. McKay, Miss Jenette Porter, Miss Laura Kinney and many others.

The exhibit of Domestic Manufactures including rugs, carpets, mats, quilts, blankets and articles of wearing apparel had every appearance of being warm, substantial, comfortable and durable. It was much larger than for many years. Prizes went to, amongst many others, Misses Ethel Handy, Lottie Levy, Laura Kinney, Fannie Burrill, and Mrs. Arthur Winter, Andrew B. Crosby, Wm. O. Porter, Jas. Pothier, and others. Mrs. W. N. Allen had a very fine show case of home made candies that deservedly won a first.

Besides making arrangements for the exhibits, the providing of entertainment forms a very important part of every exhibition. The management looked after this, indoors, by two sets of performers, a group of three "tumblers," and a pair of "ladder performers." Both were clever thrillers, and were received by the large crowds with enthusiastic applause. They also listened with appreciation and keen interest to the recruiting meeting with Lieut.-Col. Seeley and Lieut. Morton as speakers. Three recruits were added to the already large number of nearly 400 sent from Yarmouth county.

The chief outside attraction was the parade of prize winning stock, a parade so large as to completely fill the full circle of the stock yard. This event was second in interest only, to the testing of the horses and putting them through their paces for the benefit of the pudges. Then thehre was the hauling contest for oxen, in which first prize went to Mr. Edw. Hatfield, whose oxen hauled 1.44 lbs. per pound of ox; 2nd prize to Mr. Geo. Handy, at the rate of 1.40 lbs. per pound, and 3rd to Mr. Joe Ellis with a pull of 1.36 lbs. per pound. Pretty close, with some deft exhibition of teaming.

These attractions, with the merry-go-round, and the usual side shows, made a very interesting and profitable exhibiion. Financially, too, the exhibition was a success. And the management are coming in for no end of congratulations on the splendid results of the 1915 agricultural exhibition.

A COLD

Settled On Her Lungs

Causing Great Pain.

THE CURE WAS

DR. WOOD'S Norway Pine Syrup.

Miss D. M. Pickering, St. Catharines, Ont., writes: "Having derived great benefit from Dr. Wood's Norway Pine Syrup, I thought I would write and tell you of my experience. When I first came out from England I contracted a severe cold, owing to the change of climate. It settled on my lungs, and caused me a great deal of pain. I tried every remedy I could think of, but got no relief. My father, who had heard a great deal about the good qualities of Dr. Wood's Norway Pine Syrup, advised me to try it. I did so, and I am pleased to say, found immediate relief. I only took one bottle and it cured me completely. My mother had a severe cold also, and Dr. Wood's Norway Pine Syrup cured her, so we never fail to keep a bottle of it in the house."

See that none of those so-called "pine syrups" are handed out to you when you go to your druggist or dealer and ask for "Dr. Wood's." It is put up in a yellow wrapper; three pine trees the trade mark; price, 25c and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Parasitic Diseases of Sheep.

(Continued from last issue.)

Parasitic Gastritis.

This was inflammation of the fourth stomach due to the presence of parasites, and was first known in this country by the name of the Lincolnshire disease. He had never know sheep or lambs to recover with any sort of treatment when once the serious symptoms had developed and all that they could hope to do was to treat the whole flock on finding evidence of the disease, whether the animal appeared ill or not. The worms were so small that they were practically invisible to the naked eye when mixed in food. eH suggested that if deaths occurred among their lambs after weaning it was desirable to ascertain the nature of the illness that caused the mortality, an dthey should always look to the fourth stomach. The way of examination could be made very simple. Take the fourth stomach into some covered shed, obtain a glass jar, and a tumbler. Slit up one side of the stomach and pour its contents into the jar; then fill the tumbler with clear water, and using a penholder, stir up the contents of the stomach. If it is very stiff, add some water, but generally it is unusually liquid. With the wooden part of the penholder sttir up the contents and then wash the penholder in the tumbler. Hold the tumbler up to the light, and if the lamb has been badly infested possibly as many as twenty or forty specimens may be seen in it, and a fairly good idea may be formed as to whether many or comparatively few parasites are present in the stomach. He remembered one case in which the larger worms were concerned, in which they were in such active movement, wriggling about in the liquid, that the worms themselves could not be seen, but the fluid contents were agitated as one saw the water of the sea agitated by mackerel drawn up in a net to the beach.

Treatment

A careful test had been made of many of the drugs put forward for treatmentt of parasitic gastritis—creosote, petrol and arsenical tablets—but ont one of these had proved thoroughly efficient. He had carried on experiments with the use of aniline dye and of pepperment, but had been unable to find any evidence that these penetrated into the fourth stomach, and the fact was that any drug that would reach the fourth stomach in condition to prove effective would have to be given in doses sufficient to poison the animal. For that reason all efforts to find a specific for the terrible scourge had failed. He had had as much success with the old-fashioned remedy of turpentine and oil as with any other. Apparently turpentine and oil produced no effect in his experiments, but in actual practice it was found successful in one outbreak; then it was tried in another and proved absolutely useless. It was important to recognize the disease early, and the only thing was to try a varietyof remedies. Give turpentine and oil; give a mixture of drugs, such as extract of male fern, 7 oz., oil of turpentine 7 oz., tincture of asafoetida 7 oz., cresote 5 dhrachms, and linseed oil 1 quart; mix all together and give a lamb one tablespoonful and sheep two; the dose could be repeated and given for some time every three days. That treatment had on some occasions be very successful.

A discusion followed. The chairman said one of the principal remedies was to feed the lambs as soon as they could possibly get to the trough to dry food, and give sulphate of iron and plenty of rock salt; that would go a long way to ward off this terrible danger. His own experience was that cases were as frequent on upland pastures as on lowland.

In reply to questions Mr. Higgs, the owner of the sheep referred to by the lecturer, said the sheep had been bred from again, and no further trouble had occurred in any shape or form.

Mr. Sherwood said he tried to keep the animals off old, stale pasture as much as possible as a preventive, and always gave the sheep a mixture into which sulphate of iron and common salt entered; this was mixed with artificial foods. With good food it enabled the lamb very quickly to throw off the attacks of both tapeworm and stomach worm.

Constipation--
the bane of old age
is not to be cured by harsh purgatives; they rather aggravate the trouble. For a gentle, but sure laxative, use Chamberlain's Stomach and Liver Tablets. They stir up the liver, tone the nerves and freshen the stomach and bowels just like an internal bath.

CHAMBERLAIN'S TABLETS

Woman's best friend.
From girlhood to old age, these little red health restorers are an unfailing guide to an active liver and a clean, healthy, normal stomach. Take a Chamberlain's Stomach Tablet at night and the sour stomach and fermentation, and the headache, have all gone by morning.

THIN & NERVOUS BABIES

Suffering Little Ones Cured by Dr. Cassell's Tablets.

FIVE MONTHS-OLD INFANT WHO WEIGHED ONLY 7 LBS.

SO THIN HIS MOTHER SHUDDERED TO UNDRESS HIM

NEVER BELIEVED HE COULD LIVE

BUT NOW BRIGHT AND WELL CURED ABSOLUTELY BY

DR. CASSELL'S TABLETS

Here is matter to interest every mother throughout this great Dominion; the frank, grateful testimony of other mothers who have proved Dr. Cassell's Tablets a real help in winning back health for their little ones. And the cases are not in any way exceptional; they show just such splendid resutls as any mother may expect from systematic use of this valuable medicine. Dr. Cassell's Tablets have proved their worth in Great Britain, where their sale is the largest of its class, and in the Britains beyond the seas their reputation is advancing rapidly.

Now read what a happy mother has to say of Dr. Cassell's Tablets. She is Mrs. Fern, of 82, Desborough-road, Eastleigh, Hants, England, and her story is as given to an interviewer. She said:—

"When I think of all that Dr. Cassell's Tablets have done for my little baby I bless the day I heard of them. I am convinced they saved my child's life

"My little Harold was a fine baby when born but soon he began to fail, and when a few weeks old I had to have advice. For four months baby was under treatment, but no good came of it; the child only got worse. It was pitiful to see him, he was so appallingly thin His little bones stood out all over his body. We could easily count the joints in his back-bone, his shoulders were hollowed in like pits,

Baby Fern.

and his cheek-bones stood up like ridges. It made me shudder to undress him, he was such a frail little skeleton of a baby. He could not keep anything on his stomach, not even the breast—and I'm sure I am healthy enough We had ever so much medicine, but baby seemed doomed. Once I really thought he was gone, he lay so still and his jaw had dropped. The anxiety was terrible Often and often I have sat up with my poor little Harold waiting for the end But thanks to Dr. Cassell's Tabelts it was not to be

"Harold was 5 months old and weighed only 7 pounds, when we first got Dr. Cassell's Tablets. Actually in two days there was an improvement, and now, two months later, he weighs over 12 lbs,. and is ever so bright and well."

LOST USE OF HER LIMBS

NOW STRONG AND WELL

Every day proof is added to proof that Dr. Cassell's Tablets possess striking power to renew healthy nerve action and thus to restore activity where even the power to move has been lost. Particularly is this so in the case of children; and numberless cures have been effected, and are constantly being effected, both here in Canada as well as other parts of the Empire. Mrs. Parsley of Chapel Hill,

Braintree, Essex, England, said; "Baby was only about a year old when she began to lose the use of her limbs,, and soon became quite helpless. Of course, we were very much alarmed, and when we were told the child would not be able to walk for years, we almost lost hope. We had the best treatment we could find for her, but nothing seemed to help the child at all. Indeed, instead of getting better she just wasted away till she was a mere frame. She hardly ate anything, and was so weak and ill that it could not seem possible she could recover.

"Then we gave her Dr. Cassell's Tablets. The first effect of the Tablets was that the baby got sound, natural sleep. Then she improved in general health, and gradually power returned to her, until baby got stronger and stronger, more plump, till now she is quite cured."

BRITIAN'S GREATEST REMEDY

POPULARITY NOW WORLD-WIDE.

It is cures like the above, the genuineness of which has been thoroughly investigated, that have made Dr. Cassell's Tablets one of the most talked of remedies of modern times. Their entire safety and purity, their suitability for young and old alike, and their peculiar efficacy have ensured a high reputation throughout the world. Test their reliability as a remedy if you suffer from Nervovus Breakdown, Nerve Failure, Infantile Weakness, Neurasthenia, Sleeplessness, Anaemia, Kidney Trouble, Dyspepsia, Stomach Disorders, Wasting, Palpitation, and they are specially valuable for nursing mothers and girls approaching womanhood. All druggists and storekeepers throughout the Dominion sell Dr.. Cassell's Tablets at 50 cents. People in outlying districts should keep Dr. Cassell's Tablets by them in case of emergency. A Free Sample will be sent on receipt of 5 cents for mailing and packing, by the Sole Agents for Canada, H. F, Ritchie and Co., Ltd., 10, McCaul-street, Toronto Ont.

Just the range you'd specify if you had one made to order

Most housewives have a very clear idea of what their ideal range would be—they are familiar with different ranges and know the features they like best and the features they do not approve of.
We believe we know the features which would receive their approval, and the features which would not.
In the "Kootenay" range we have combined all the good features and have left out other features which the majority of women would leave out.
The "Kootenay" range will more nearly meet the ideal range you would have built according to specifications than any other range made.

McClary's Kootenay Range

The present model is the same sterling cooker and baker of former years, but made handsomer with more bright nickel trimming. *Durable* because the body is "ARMCO" rust-resisting iron, and firebox linings are McClary Semi-Steel; *economical* because its heavy Duplex grates give a clear fire from end to end and its firebox is built to save fuel; *a wonderful baker* because heat reaches every part of the oven, which is of nickelled steel, drawing and retaining heat better than any other material.

You can purchase a McClary Kootenay range by a personal examination of the range in the store of your nearest dealer, and you can write to the Company for full information, which is given in a booklet. It is a satisfaction and an advantage to have studied this booklet carefully and thereby know fully about the range before examining the article itself. With this information studied up you are able, when you go into the dealer's store, to intelligently discuss and examine the range itself.

For this reason we invite every reader of this advt. who is interested in the purchase of a range to fill out the coupon and mail it direct to our head office.

FOR
Indigestion
and
Biliousness

Indigestion, biliousness, headaches, flatulence, pains after eating, constipation, are all common symptoms of stomach and liver troubles. And the more you neglect them the more you suffer. Take Mother Seigel's Syrup if your stomach, liver, or bowels are slightly deranged or

MOTHER
SEIGEL'S
SYRUP

have lost tone. Mother Seigel's Syrup is made from the curative extracts of certain roots, barks, and leaves, which have a remarkable tonic and strengthening effect on all the organs of digestion. The distressing symptoms of indigestion or liver troubles soon disappear under its beneficial action. Buy a bottle to-day, but be sure you get the genuine Mother Seigel's Syrup. There are many imitations, but not one that gives the same health benefits. 1015

is the
Best Remedy

NOW SOLD IN TWO SIZES ONLY.

Is YOUR Barn "Pedlarized"?

FIRST of all—the Roof—is it shingled with "Oshawa" or "George" Shingles? No matter how strong the foundation, or how tight the walls, if the roof is not weather-tight, fireproof and permanent, the building is—or soon will be—worthless.

PEDLAR'S "Oshawa" Galvanized Steel Shingles have stood the test of time. Made in two distinct models, 660A and 660B, the "Oshawa" Shingle (size 16" x 20") is ideal for the average barn or dwelling. The "George" (size 24" x 24"), for extra large roofs.

A Word About Ventilation

GOOD Ventilation is very important to the health of your stock, or the successful marketing of your crops. A poorly ventilated barn might easily cost you more than a new building. Proper ventilation demands that a large volume of air be kept constantly moving, but not too quickly, preventing dangerous and unnecessary draughts.

PEDLAR'S "Superior" BARN VENTILATOR

is storm-proof, bird-proof, durable, and prevents a downward current of air. It is made with a stationary cap, which is acted upon by the natural air currents, so as to produce a suction which draws up the impure air. This impure air is replaced by pure, fresh air which enters through inlets in, or near, the floor, preventing the accumulation of hot air, vapors and gases which are, all too often, responsible for damage to stock or grain.

Write to-day for literature, and ask for Booklet "V M. F." Address nearest Branch.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

A. HECTOR CUTTEN, - Inglewood Farm, Lower Truro, N. S.

Third Annual Convention of the N. B. Women's Institutes.

(Continued from Page 43)

bert Trites of Petitcodiac, and "Civic Improvement Work," by Mrs. J. F. Roach, of Sussex.

For the many housekeepers assembled at the closing session of the Convention, Mr. McIntosh's illustrated address on "Household Pests" contained a number of valuable hints. This address will also be published in full and the reports, which will be ready for circulation January, 1916, will be available to all members of the Women's Institutes and others desiring to keep in touch with this organization.

Business combined with pleasure was the slogan of this year's Convention, when in addition to the above programme, the delegates were entertained to an automobile ride about the city and suburbs, Thursday afternoon, and a musical programme and reception the closing evening.

In order to encourage handicrafts in the homes of New Brunswick and to create a market for this work, the department had on exhibition at the Convention a beautiful collection in handicrafts, including mats, rugs, small covers, curtains, woven cloths and basketry. The exhibit was so arranged as to show off the designs to the best advantage, and the delegates and visitors were loud in their praises of the excellent display, the work of the women of the Province of Quebec.

A Farmer's Letter.

Teaches Necessity of Right Selection of Best Possible Potato Seed.

Farmers in the Maritime Provinces should put on their "thinking caps" after reading the following short letter from an Ontario agriculturist—a sort of "Macedonian cry" for help from the potato-growers of Eastern Canada The note runs:

"Dear Sir: The potato crops of the country are a failure. The member here advised me to write to you, saying that you might be able to tell me where good potatoes can be got and who has them for sale."

This is a typical letter chosen from several others which the Secrettary of Agriculture for Nova Scotia has received and is still receiving, from farmers and dealers in Ontario where the potato crop was a failure, chiefly due to a long season of wet weather that favored black rot. From the letter Maritime farmers should learn the importance of making the most careful selecttions of high class seed from this fall's yields. This should be do ie both for seed and for comemrcial purposes.

The first thing to do is to make a provisional selection of the best seed potatoes, which in 90 per cent of cases are to be found under the best plants or hills. This should be done shortly prior to the regular digging. But a second selection is absolutely imperative, after the first have been collected into a bin or piled on the barn floor. Here they should be picked over again, each potato rigidly inspected, and any that showed the slightest spot should be totally rejected from the new seed piles. In fact, the inspection and rejection cannot be too rigorous. For plant diseases are highly contagious. There a good rule is to select only sound and unblemished potatoes, rejecting even those which have slight bruises or cuts. This should be done over again at the time of spring planting.

Only in this way can farmers be sure that they have got potato seed that is prime in quality for yield, and likely to be immune from disease and the black rot parasite. Also it is the only way to get big prime yields, so as to have enough for seed, and for the home and export markets, and for a grade that will fetch the very highest prices in these markets. There is no fancy humbug about these recommenadtions. It is good business sense, and the time spent on the job means choice big crops and corresponding profits in real money.

FARM TO LET

Desirable Farm on the St. John River to let for such term of years as may be agreed upon. The farm extends to 100 acres or thereby, capable of growing all kinds of crops and specially adapted to fruit growing. There is a splendid orchard of about 500 trees on the property.

The house and buildings are commodious and suitable for the requirements of the place.

For further particulars apply to

GROWING THE POTATO CROP.

By F. Leslie Wood, Carter's Point, N. B.

The potato, one of our largest and most valuable crops, is one of the methods of culture of which can and should be greatly improved. The average yield in Canada is about 125 bushels per acre while it has been proven that the grower who practises proper methods of cultivation can easily grow a 300 bushel crop, this being far below the possible yield.

The Soil

Potatoes thrive and yield satisfactory crops in a large variety of soils. The ideal soil seems to be a deep, rich warm, sandy loam, containing a large amount of humus, which will insure the retention of a large amount of moisture. Potatoes will not thrive in cold, wet soils, so it is necessary that the land be well drained.

Potatoes yeild well when grown on sod, stubble or on new land. Such soils, because of the decaying vegetable matter or humus they contain, are retentive of moisture and furnish large quantities of available plant food. Potatoes grown on the heavier types of soil are neither as smooth in shape nor uniform in size as those grown on lighter soils, and are not as good in quality.

Preparation of the Land

As potatoes thrive best in a loose soil spring plowing is usually preferable to fall plowing. One of the best methods is to grow potatoes on a clover sod which has been top-dressed before plowing, with barnyard manure at the rate of 10 to 12 tons per acre. The manure may be applied either in the fall or spring, but if applied in the spring rotted manure should be used, while fresh manure will be satisfactory if applied in the fall. The plowing should be done deeply enough that the clover will be well covered. Further preparation of the land consists in harrowing thoroughly. If the planting is to be done on stubble the land would be prepared in much the same manner as outlined for sod. The manure, whether green or rotted, should not be applied in drills with the seed as this favors the development of scab.

Fertilizers.

Perhaps there is on more satisfactory way of supplying fertilizer for the potato crop than by plowing down a clover sod which has been top-dressed with manure in the method already described. However, commercial fertilizers are used to a large extent and if the farmer expects to use such fertilizers he should determine by experiment what elements of plant food his soil requires. While a fertilizer cannot be mixed which will meet the requirements of the potato crop in every soil, the following mixture should give good results when used together with barnyard manure:

Nitrate of Soda .....150 lbs.
Sulphate of Potash .....250 lbs.
Acid Phosphate .....300 lbs.

Planting

One of the most common methods of planting is to open furrows with the plow, drop the sets by hand, and cover with the plow. This is a fairly satisfactory method if the smoothening harrow is used after the plow to level off the ridges so that evaporation will not take place so rapidly. Where the acreage to be planted is large, the potato planter is needed. It has been stated that it is not well to put manure in the drills with the sets, but it has usually been found best to apply commercial fertilizers in the drills, as the potato plant has not a very extensive root system to enable it to secure the plant food in the fertilizer. Where the planter is used the fertilizer is sown at the same time as the sets are dropped. The sets should be planted in rows about 30 inches apart, the sets being placed from 12 to 14 inches apart in the rows. One quite common and very satisfactory way to do the planting is to drop the sets in, every third furrow at the time of plowing. After covering by plowing in this manner the ground should be well harrowed.

Potatoes for Planting

Considerable difference of opinion exists among potato growers as to what tubers should be selected for sets. Some advise using the smaller sized potatoes, some the medium in size, and some the large. Experiments show, however, that potatoes which are from medium to large in size, which are well shaped, and which preferably were taken from hills giving a high yield of marketable tubers should be used. The seed should undoubtedly be selected at the time of digging and not be merely the "left-overs" which are found in the cellar at planting time. The seed potatoes should be well stored and not allowed to send out long sprouts, as they will in a warm, moist, cellar, as this lowers the vitality of the tubers. As to the size of the sets, and the number of eyes to each set the best practice is to make good sized sets having two or three eyes each. The sets should be planted immediately after they have been cut. If it is absolutely necessary that they must be cut a considerable time before they are to be planted, the cut surfaces should be coated with gypsum or land plaster.

Time of Planting

For the main crop the best yield will usually be obtained by planting as soon as possible after the ground becomes reasonably warm and in good condition to work. As early market potatoes usually bring good prices, many growers plant as early as possible, risking the freezing of the sprouts in order to get their potatoes on the market early in the season. Where the growing of early market potatoes is practised it is customary to have the seed potatoes sprouted before planting. This is done by spreading them in trays or on the floor of a well lighted room where the temperature is not warm enough to cause a quick growth of sprouts and not cold enough to freeze. The tips of the early potatoes may be protected from a late spring frost by throwing earth over them with the plow.

Cultivation

The importance of a large supply of moisture, of available plant food, and of keeping the surface soil loose has been pointed out, so it will be understood that in order to meet these requirements cultivation must be thoroughly done. A few days after the planting, the ground should be harrowed with a smoothening harrow or weeder. This should be followed about a week later by another harrowing. These harrowings will kill the seedling weeds which are sprouting at this time and if well done there should be little hand hoeing necessary to keep the potatoes clean throughout the season. Following the harrowings the cultivator should be used every week or ten days or as often as is necessary to keep a loose mulch on the surface, until the tops of the potatoes cover the ground and interfere with the cultivation. The first cultivation should be given as soon as the rows can be well distinguished and may be done deeply and as near the plants as possible without injuring them. The following cultivations must be shallower or the roots will be injured.

The question as to whether potatoes should be planted on the level or in ridges in a large one, and each farmer should determine by experiment which method best suits his conditions. In general, level culture should be given where there is likely to be a lack of moisture and where thorough cultivation will be given. Ridge culture will be the more satisfactory where the soil is heavy, wet, cold ,or where cultivation is not so perfect.

Spraying

It is a common sight through some sections of country to see fields of potatoes which have otherwise had good attention stripped entirely of their leaves by the ravages of the potato beetle, or killed down by blight, and at the time of digging with ten, twenty, fifty or even seventy-five per cent of the crop rotted. This is a needless waste as both insects and fungous diseases can be easily controlled by spraying. Every potato grower should have some knowledge of the more common insects and fungous diseases in order that he can intelligently combat these pests.

The most destructive insect enemy of the potato is the Colorado potato beetle, known to farmers as the potato "bug" and so well known that further description of the insect is unnecessary. They can be controlled by spraying with either Paris green or lead arsenate. The spraying should begin at least as soon as the first larvae or young "bugs" are hatched and the foliage must be kept covered with the poison as long as the insects continue to do damage. With Paris green, 8 oz. to 40 gals. of water, with 1 to 2 lbs. of lime added to neutralize any free arsenic which might be present and which would cause burning of the leaves. From 2 to 3 lbs. of lead arsenate to 40 gals. of water are required. The Paris green kills more rapidly than the lead arsenate but the latter sticks better to the foliage and is not so easily washed off by rains.

The most troublesome fungous diseases of the potato are the early and late potato blights and the potato scab. The late blight is the disease causing the early killing of the potato tops and the subsequent rotting of the tubers and is well known to farmers as "the rust." The blight may be controlled by spraying with Bordeaux mixture. This is made of 4 lbs. of copper sulphate and 4 lbs. of good lime and should be made in the following manner. Dissolve the copper sulphate by hanging in a sack in a wooden vessel containing hot water. After it is dissolved add water to make 20 gallons. Slake the lime in a small quantity of water and after slaking add water to make 20 gallons. Then mix the copper sulphate solution and the lime thoroughly. Care must always be taken to dilute both lime and copper sulphate before mixing as this makes a mixture which will stay in suspension better than if they are mixed before being diluted. At least three sprayings of this mixture should be given to control the blight. The poison for the potato beetle may be added to the Bordeaux and applied at the same time. To control both blight and "bugs" spraying should begin early in July or when the larvae of the beetles first begin to emerge and feed on the leaves. Later sprayings should be applied as the mixture is washed from the leaves by rains or as the plants continue to grow. It should be borne in mind that spraying is a preventative of blight, not a cure, and so must be done early and thoroughly.

Potato scab is quite troublesome in some sections and is well known. It is a fungous disease and is most commonly found in fields in which the soil is alkaline in nature, or where the manure has been applied directly in the furrows at the time of planting. The spores of scab on potatoes used for seed can be killed by treating with formalin, using ½ pint of formalin to 15 gallons of water. The potatoes should be soaked in this solution for

The Cheese Industry in P. E. I.

Editor, Maritime Farmer:

The Maritime Farmer, of October 26th, contains an article on The Cheese Industry in Prince Edward Island, by J. A. McDonald, which is not accurate in all its details.

Since 1900 the net value of milk to patrons per hundred pounds has been considerably higher when the milk was made into cheese than when made into butter. In five years milk made into butter gave a better net return clear of the skim milk but in the other years the cheese. Your correspondent says that "cheese will rule this year around one dollar a hundred for the milk." This is altogether too low an estimate. The price of cheese has been higher this year than any year since dairying began in Prince Edward Island, and last year the average net value of milk per hundred pounds from cheese was about $1.09. Only three factories in the province went below $1.00 and the total receipts at these three factories were 620,000 lbs. of milk, while Emerald, with a total receipt of 2,055,731 lbs., paid $1.11 per hundred pounds, net value to patrons. Last year only four creameries in the province paid over $1.00 per hundred for milk manufactured into butter, and most of this milk was produced in the winter when production costs more and when the price of butter is liable to be higher. The average price of milk sent to the butter factories was about 90c per hundred pounds, while one creamery receiving half a million pounds of milk paid only 78c per hundred pounds.

There is no doubt but that intelligent farmers would prefer patronizing the creamery rather than a cheese factory because the skim milk is very valuable on the farm, but it is doubtful if the average farmer will make 33c per hundred pounds out of it.

Further, your correspondent is correct when he speaks of the quality of Island cheese but Island butter has not the same reputation.

Further, there is an unlimited market for cheese, while up to the present time the butter market has been limited almost altogether to the Maritiem Provinces, and if all the milk that was produced in Prince Edward Island was being manufactured into butter there is no doubt but that the price of butter would be much lower than it has been. In fact there is very considerable difficulty every summer in disposing of the butter, and farmers should be careful about dropping the production of cheese and taking up the production of butter.

The ideal plan, and the only one that will make dairying profitable in Prince Edward Island, is the production of milk the whole year round, and if that were done cheese might be made in the summer and butter in the winter months.

Your correspondent is entirely astray when he states that "none of the factories take milk by test." Every cheese factory and creamery on Prince Edward Island pays for milk by its test and has been paying that way for a number of years. The writer has yet to learn of any creamery or factory that has not done this since 1900.

Again, it may be possible to accept milk at a creamery that has been slightly soured but no cheese-maker would think of accepting it as the milk would not curd properly.

Our farmers do not follow slipshod and indifferent methods, and the cleanest and richest milk will be found in the districts that are giving most attention to dairying. Several of the factories on Prince Edward Island are grading the cream, and the dairy industry, although probably not as prosperous as it should be, is being run after the most approved methods, and among the most prosperous districts in this "garden province" are those that have been following "cheese-dairying."

Yours truly,

FARMER.

N. B. Agricultural Schools.

Hon. J. A. Murray Tells of What They Will Stand For--Have Been Established Under Advise of Dr. C. C. James.

Hon. J. A. Murray, New Brunswick's Minister of Agriculture, speaking of an article on Agricultural Schools in New Brunswick, tells the Maritime Farmer, that no definite policy in regard to this important feature of his department has yet been formulated. It was expected that an announcement would have been made long since, but with the agricultural staff of the province depleted through the enlistment of several of its members, there has been an interruption of the pending ararngements, and unlooked for delay in developing the schools along the lines intended.

The schools of New Brunswick are intended to be vocational or preparatory institutions. It is never hoped that they will become colleges, in fact the minister expressed himself as strongly opposed to the establishment of a college in this province, thus duplicating the particularly well equipped agricultural colleges of other provinces. The New Brunswick schools have been established on the advice and under the direction of Dr. C. C. James, commissioner for the administration of the Dominion agricultural grant system as that which has won such signal success and high recognition in Alberta, where the difficulty has been to supply facilities with sufficient rapidity to handle the large number of pupils offering themselves for instruction.

All the work done so far in New Brunswick has been with the full sanction of Dr. James and within the next few days he will be in New Brunswick for another conference, which may be followed by an announcement of importance. The idea is to have three school centres, two of which, at Sussex and Woodstock, are already fixed and a third on the North Shore. Under this system it is felt that the elements of agricultural education can be brought right to the door of farmers' sons. By short courses, boys will be given an incentive to aim at higher agricultural education, and should they decide later to go to one or other of the larger institutions, the government of the province will assist them to the extent of providing transportation to the college selected. The schools will also be used for giving instruction to public school teachers and a course for the clergy of New Brunswick is also contemplated.

Speaking of the need of an agricultural college in New Brunswick, Mr. Murray stated that he could not see the necessity of one. It would result in the duplication of very excellent institutions in other provinces, notably that maintained by the government of Nova Scotia. Of the latter institution and its accomplishments, Mr. Murray spoke in the highest terms and declared his staunch support for it and its staff. He believes that the New Brunswick schools, giving the boy, as they will, a desire for higher agricultural education, will serve as recruiting grounds for the Nova Scotia and other colleges. The desire of the New Brunswick department is to give a practical grounding in agriculture, through the employment of short courses, attractive to those who might otherwise never enter an agricultural school. Once pupils are brought into contact with their studies and realize what they mean from an everyday business standpoint, it must follow that many of the more ambitious will decide to take the longer college courses. Thus the schools will accomplish much. When the policy in regard to the schools is finally determined, after some further consultations with Dr. James, and after they are equipped and the sadly depleted staffs refilled, Mr. Murray feels that the province will have the advantage of a system which will duplicate the work of the Alberta institutions.

A Not-Too-Well-Known Goat.

"Most parts of Canada where live stock production prevails are suitable to the raising of Angoras, especially if the land is high and dry the greater part of the year. They will withstand the rigor of even the coldest winter and do not require any greater shelter than a shed to protect them from wind and storm, providing a sufficient quantity of nutritious food and pure water are supplied. The Angora goat performs a two-fold service in the Canadian scheme of farming. It produces a high grade of mohair and at the same time may be used for the destruction of underbrush on lands to be broken for subsequent cultivation." Such is one of the opening paragraphs of Pamphlet No. 12 of the Sheep and Goat Division of the Live Stock Branch devoted to the Angora Goat and a general discussion of methods of management, feeding and breeding, and of mohair production, by T. Reg. Arkell, B.S.A., B.Sc., and Horace V. Bent, B.A., that can be had at no cost whatever by application to the Publications Branch, Department of Agriculture, Ottawa. The Pamphlet gives a brief sketch of the origin and history of the Angora, which from being a native of Turkey in Asia, has travelled somewhat extensively into South Africa, is fairly well known in the United States and not as well known in Canada as desirable. Mohair, of which Turkey in times of peace, supplies 10,000,000 lbs. annually. South Africa 15,000,000 lbs. and the rest of the world 6,000,000 lbs., is the technical name given the hair of the Angora goat. The word is derived from the French "mohere" and, primarily, from the Arabic "mukhayyar," meaning mohair cloth. This, with a vast deal more information about a particularly useful goat, is furnished in the information under notice. Nature and the necessary treatment for breeding and raising are set forth with details of market possibilities, of shearing, of grading, and of preparation for shipment. Extracts from letters written by successful breeders in Canada and the United States telling of their experience are printed as well as some account of the complaints to which the animals are occasionally subject, with advice as to preventive and remedies. Illustrations of types and the Fleece carried at our agricultural exhibition, exposition and interest to the pamphlet.

Cereals.

Seed Grain.—Early attention should be given to the seed grain that is to be sown next season. If no special fields for seed purposes were grown last summer, next season's requirements may be met by very careful cleaning of the main crop harvested last autumn. One can never afford to sow weed seeds and one can seldom afford to sow grain more or less mixed with other types. The fanning mill should furnish plump seed free from weeds. If other grains are present, such as oats in wheat, or barley in oats, it will be necessary, and quite worth while, to hand-pick two or three bushels during the winter so as to have a field of an acre or two to furnish pure seed for the following year. Hand-picking may appear too laborious to anyone who has not tried it, but by devoting to it an hour or two at a time a great deal can be accomplished in the course of a few weeks and without undue strain on the eyes.

If there is any doubt about the vitality of the seed, it should be tested either at home (as described in "Seasonable Hints" No 1.), or a sample sent to the Dominion Seed Branch at Ottweeds.

Change of Seed.—The best advice in regard to change of seed is this: Change only when you are sure you are getting something superior to your old stock. The new grain should be true to variety and free from weed seeds. A very great danger in obtaining seed from a long distance is that it may contain new and dangerous weeds.

Purchase of Seed.—If new seed is to be purchased, enquiries should be made early in the winter from those who have grain for sale. No large purchase of seed should be decided upon without first seeing a sample and obtaining a statement as to its germination, and as to the quantity of other grains present.

To intending purchasers of seed grain the Dominion Cerealist will be glad to furnish information as to possible sources of supply of the varieties they desire. Farmers who have seed grain for sale are requested to communicate with C. E. Saunders, Dominion Cerealist.

Smut Infection of Grain.

An experienced, practical farmer, reported to us this season 50 per cent smut in the oat field of his neighbor. If that man uses a threshing machine, it will be infected to such an extent that clean oats threshed in it may become infected and develop 50 per cent smut.

Winter threshing is occasionally practised. Use a clean machine, one that has not been used for smutty grain, or if so used, dip some old sacks into a solution of formalin (one pound to one gallon of water), wring them out and stuff them into the body of the machine and close it up. Five hours' fumigation will kill the smut spores. Spray the outside of the machine, or wash it, with the same solution. Fanning mills, threshing machines and implements infected with smut spores will contaminate clean grain. This is how many new infections of the crops of careful farmers take place.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

January 11-25

AGRICULTURAL COURSES FOR CLERGYMEN.

It is announced that the New Brunswick Department of Agriculture will hold a short course for clergymen in the Sussex Agricultural School early in the New Year. The question is asked by stand-patters, particularly those who do not see any virtue in any move that is made by any party other than their own, "What is the use or the sense of holding an agricultural course for clergymen "

To men who guffaw at the idea of holding such a course the Martime Farmer has only one thing to say: Stop braying lest you betray the class to which you belong.

There is a class of people who are of the opinion that secular and temporal matters do not mix and like the late Joseph Matheson, ex-M.P. for Richmond County, N.S., told his minister, who was particularly anxious about the finances for a heating system for his church: "Go home and attend to your praying and I will attend to the financing." We believe a minister can attend to his praying and to some work of a temporal nature that will also be of actual benefit to his parishioners.

The writer is personally acquainted with clergymen of all denominations who are interested in agriculture. These men of God are able to talk intelligently on farming topics with the young men of their parishes. Not infrequently they point the way not only how to increase their treasures in heaven but also how to increase their treasures on earth. And we believe they are succeeding better in getting in closer touch with the various members of their flock where they are capable in assisting in temporal affairs.

We have in mind a certain staid Scotch congregation that had a neat grievance against their pastor just because he used to go to the woods and chop his own firewood—infra dig—as it were. What nonsense! The minister in question was one of the brainy minds of his denomination. Exercise in the open air and good living helped him to retain those faculties to a ripe old age. There have been a few funerals in that congregation and not a few old fogies have passed away and their antiquated ideas have been buried with them.

In passing we need only refer to Rev. Dr. McPherson's good work in Antigonish County. Rev. Hunter Boyd's excellent influence in Charlotte County and Rev. Dr. Gauthier's example in Prince Edward Island, as concrete instances of what some other clergymen could accomplish along similar lines.

What Father Gauthier has been able to accomplish at Palmer Road by his untiring efforts is an interesting story that we purpose to give our readers at an early date. Suffice it to say for the present that his parishioners are making rapid progress in temporal things and spiritual matters are not by any means neglected.

Would that there were more Dr. Gauthiers, Dr. McPherson's and others like them. The short course at Sussex will help spread the movement. The move is good. Help it along. In some districts it is considered akin to sacrilege to hold a meeting of any kind other than that of a religious nature in their churches and halls. The most progressive communities today are making their churches the social centres where everything that tends to benefit the district is fostered.

The following clipping from the "News notes of the Colorado Agricultural College shows how they do things in Colorado. Read it. There may be an idea in it that will benefit you and your district:

Farmers' Unions Meet in Churches.

"In many of the rural communities in Colorado "not only are the churches used for worship, but "as meeting places for the farmers' unions and "other agricultural organizations. According to "the pastors, the result of opening the churches "for such meetings has shown a decided gain in "the attendances at the religious and of course a "betterment of the moral standing of the people "of the community.

"With reference to the holding of such meet-"ings, Rev. Oren Orahood, pastor of the church on "the S. L. W. ranch near Gill, Colorado, says, 'We "endeavor to make the church a social and agricul-"tural centre. The Farmers' Union at Gill and the "Men's Brotherhood at S. L. W. meet at the church "once a month to discuss their problems and have "a social hour together. Occasionally they have "some expert in some agricultural line to give "them an address.'"

THE FARMERS PLAY.

Perhaps you don't want to play, or you think you're too old, or you say you've forgotten how! No one is too old, nor too stiff, no one "doesn't want to play" although there may be a few who think they've forgotten how. All the sorrows in life may be helped to be eliminated by some active form of play or pleasure. It is good for man to play and for the farmer most of all!

You say that you do not need exercise, but that is a wrong impression, for your daily work tends to make you stiff and does not develop the fine, delicate muscles that bring ease, grace and bodily control. All active out-of-door games tend to this development. Why not play with your wife, with your children, with your neighbor and make the most of what there is in life for you? For an hour after supper take time to play tennis, base ball, volley ball or some form of amusement in which you are particularly interested. Your work will hold a keener joy for you, for you will have unconsciously acquired the attitude of play toward it.

You can never take wealth nor material possessions with you when you leave this world, but you can give to it and gain from it much of pleasure in the pure enjoyment of the good and happy things of life. We were made to be happy, and the greatest material happiness comes through the enjoyment of some form of recreative sport, after a day of good work well done.

Don't sit on the side lines and watch! Come into the open and play! Drop your work for a few moments every day and play with your children, for verily a little child shall lead you back into that long forgotten kingdom of early joys and greatest of opportunities, your youth and all it held for you.

THE APPLE CROP WILL REQUIRE CAREFUL GRADING.

Owing to the development of scab in almost every district, packers will be required to exercise very great care in sorting the fruit. The inspection records show that the greatest number of violations occur in years such as the present one, when prices rule high and fruit is scabby. The requirements of the Inspection and Sale Act, Part IX, does not change with the varying conditions of the crop from year to year.

It is reasonable to expect that owing to the short crop, there will be a demand for all marketable fruit, and even No. 3's, if of good size though slightly scabby, should bring fair returns to the grower. The very small, immature No. 3 fruit should never be packed as it will not pay for barrel and freight.

EDITORIAL NOTES

Expect the best of life, then you are more likely to work toward it and to get it.

* * *

Young man, when you ask for a "chance," what do you mean? Do you mean an opportunity to make good? Or do you simply mean a chance to get money without effort?

* * *

The greatest mischief in handling farm stock comes from improper food, filthy or impure drinking water, bad ventilation of stables, overwork or lack of exercise and poor sanitary conditions.

* * *

The man on the farm wants to get into town so as to get rid of the "daily grind" of farm life. The man in the city wants to get "back on the farm" to escape the "daily grind" of the city. And so it goes, everybody trying to escape their own grinnd. And yet no man ever made a success of life in any spot or place who was looking for a chance to escape the "grind."

* * *

Take things as they come, but make them come the way you want them to.

* * *

You'll never know what you can do till you try.

* * *

Accidents are no more a matter of ill luck than good fortune is a matter of good luck.

* * *

The man who has learned that it is just as easy for him to be wrong as for the other fellow, has acquired valuable knowledge.

* * *

One year's seeding, seven years' weeding. Burn all weedy rubbish.

Underdrainage.

Editor the Maritime Farmer:

Much has been said and written on the subject of underdrainage, showing why we should drain our soils, of how drainage affects or assists in the pulverization, how it lightens the work of the farmer, lengthens out the season for work, preventing the washing of soils, promoting absorption, adapting the soil to germination, the effect on temperature, the improvement in the quality of crops grown, the loss of heat caused through the lack of underdrainage, chilled air, soil breath, etc., but none of these in the mind of the writer are of greater importance to the individual and hence to the nation at large, than the last mentioned, namely, **soil breathes.**

One at first thought might be tempted to say that this is an unheard of thing, it must be some new "fad" of the scientist, but not so. Have you ever thought how everything breathes, animate and inanimate alike? We inspire air continuously, and thus keep ourselves in good condition, and so does your coat and jacket. The air penetrates every fibre of our wardrobe, passing in and out, and carrying out something it did not carry in. If your clothing was impermeable to air you could not tolerate it for an hour. The invisible waves of air wash and purify you every hour. Many examples could be given to prove the above, but space will not permit.

Water Stops Soil Breathing

If the walls of the house are wet, the passage of air is prevented. In the same way, if soil is drenched, or soaked with water, the passage of air is prevented. It will pass through 14" of dry soil more easily than through 4" of wet soil. Indeed, the air will not pass at all through a thin stratum of wet soil, but will readily pass through a thick stratum of dry soil. You thus see that a drenched soil is a drowned soil; that all the conservative influences secured by the itneraction of soil and air are cut off short by the presence of ground water.

The sanitary report for England, some years ago, gives the following conclusions in respect to the influence of soil dampness.

1. Excess of moisture, even on lands not evidently wet, is the cause of fogs and dampness.

2. Dampness serves as a medium of conveyance for any decomposing matter that may be evolved, and adds to any injurious effect of such matter in the air; in other w rds, the excess of moisture may be said to increase or aggravate excess in impurities in the atmosphere.

3. The exaporation of surplus moisture lowers the temperature, produces chills, and creates or aggravates the sudden and injurious changes of temperature by which the health is injured.

4. Catarrh and rheumatism are natural products of the chills and damps of un undrained soil. Diarrhoea, dysentry and malarial fevers in districts where ground water abounds and the water-line approaches the surface.

Finally, extensive researches in England, Germany and America have established the fact that undrained soils greatly promote consumption. This much to be dreaded disease, the direct cause of one-seventh of the deaths in the world, finds its favorite haunt in the water-logged soil. This is no wild guess, thrown out to be the sensation of the hour, but it is sustained by a vast array of facts, and is a result independently reached by separate investigators in widely separated countries. However precarious may be the field crops on a water soaked soil, the abundant house crop of consumptives may be safely counted upon. The entailments of living on water-soaked and undrained soils, therefore, are catarrh, ague and rheumatism in the spring; diarrhoea, dysentry and fever in the hot months; pleurisy, pneumonia and diphtheria in cold months, and consumption the year round. We have histories of races and dynasties, their rise, progress and decline, the causes which brought them into prominence and the forces which brought them to their downfall. Why should not the soil have likewise a history of its own and take on a personality as truly as a race? Let us scan the features of such a farm and follow the history springing from its inherent qualities. The surface is somewhat level or gently undulating. the soil a tenacious clay, strong in the elements of enduring fertility, if the physical conditions are properly adjusted, the natural drainage is very slight, except that much of the surface water can run off by overflow, but the tenacious quality of the soil prevents all deep drainage; the deeper soil is water-soaked in the spring and early summer, and at other times when heavy rains fall; gate and fence posts are heaved out by the frosts; winter wheat and clover are half uprooted by the same force, work is late in the spring because the soil is cold and wet, crops are slow to start and slower to ripen. The farmer has a "hard roe to hoe." A hopeful and cheerful spirit is conspicuously wanting because he has generally poor success with his crops. "Bad luck" and because of his continuous depression of poor health. The furrows seam his cheeks early. His shoulders stoop when he should stand erect in manhood's prime.

Indoors the wife soon fades, the bloom and laugh of happy girlhood gives place to the chronic invalidism of motherhood. Children are born only to die, or linger on in joyless ill health. The family is finally blotted out, unless a surviving son may hand down their heirloom of sorrow to another generation, when the farm passes into other hands to repeat the same story. And thus we see in hopeless succession the generation of joyless owners pass before our eyes. The doctor, the undertaken, and the sheriff enter in succession to shift the stage of scenery, but the sad drama goes on with little variation.

Is this all a fragment of imagination? Can you not tell farms where many of these features can be traced in the water-soaked soil? Examples of this kind might be quoted by the hour. But when houses are built upon retentive water-soaked soils, and no means employed to take off the ground water, or ward off its effects, the harvest of woe is sure, though it may be slow to ripen.—John Woods.

A Visit to the Basic Slag Works at Sydney, N. S.

Recently the editor of this paper spent a very instructive afternoon going over the Basic Slag Works of the Cross Fertilizer Co., Ltd., at Sydney, N.S. These works cover an area of over six acres and were erected to deal with the basic slag produced by the Dominion Iron & Steel Co., Ltd., as a by-product in the Bessemer process of steel making. All Slag produced at the steel works is not of value from an agricultural point of view. Only basic slag containing phosphoric acid in a soluble state is suitable for fertilizing proposes. The slag utilized by the Cross Fertilizer Co. is obtained in the elimination of the prosphorus from the iron during its conversion into steel. At the Bessemer furnaces the slag is poured into cars having removable sides. These cars hold from ten to fifteen tons of slag which solidifies after a short time, and they are then run by private railway to the slag works. The sides of the car are removed and a crane is hitched on to the block of slag which is deposited quite close to the grinding mills. These blocks of slag are then broken by a drop ball weighing 3,000 lbs. falling from a height of thirty feet. By this means it is reduced to pieces not more than seven pounds in weight, after which it is loaded into bogey cars holding about 1,500 pounds and run into a hoist and elevated to a large hopper holding one hundred tons.

The slag is mechanically tipped into this hopper from which it is fed by a travelling conveyor to a couple of ball mills. The mills are loaded with a charge of 3,500 pounds of steel balls, each five inches in diameter, and are driven by steam at the rate of 25 revolutions per minute. The slag undergoes pounding in the ball mills which reduces it to a rough powder, all of which will pass a seive having twelve mesh to the inch.

From the ball mills the slag is conveyed to a tube or finishing mill. The tube mill is a steel cylinder, thirty feet in length, containing ten tons of steel balls of assorted sizes ranging from three-quarters to two inches in diameter. The slag passes in at one end of the mill, which is driven at the rate of thirty revolutions per minute and the pounding of the steel balls completes the process of grinding. The finished product finally passes from the mill ground so fine that over 80% will pass a 100-mesh seive, that is a sieve having 10,000 holes to the square inch. From the tube mill the ground slag is taken by an overhead conveyor to the warehouse where it is bagged and weighed automatically and stored until required by the farmers for application to their land in the autumn or spring. The mills have a capacity of 10 tons per hour, and working day and night, can easily turn out 1000 tons per week.

As slag is not in consumption all the year round, very large storage capacity is required and the Cross Fertilizer Co., Ltd., the proprietors of the basic slag works, has had to erect a warehouse 365 feet long by 150 feet wide, capable of holding 15,000 tons of the finished product. A railway runs through the entire length of the warehouse and when necessary 12 cars can be loaded at a time. The mills are driven by a 500 h.p. engine supplied by Fullerton, Hodgart & Barclay, Ltd., of Paisley, Scotland, to which steam is furnished by two Lancashire boilers by Penman & Co., of Glasgow, Scotland. The entire cost of buildings and plant amounted to $200,000.

The demand for Sydney Basic Slag is increasing every year. Grinding at present is going on at the rate of 100 tons every 24 hours, and in view of the shortage of supplies last season many buyers are taking delivery now. It is expected that there will be a considerable increase in the production of basic slag during the coming season on account of the active state of the steel trade, but every ton that can be produced will be needed to supply the wants of Canadian farmers.

New Grades of Seed Grain.

Special grades for seed wheat, oats and barley are now authorized by Order-in-Council as follows:

No. 1 Manitoba Northern seed wheat shall be composed of 85 per cent Red Fife or of Marquis wheat, sound, clean, free from other grain, and free from noxious weed seeds within the meaning of the Seed Control Act, weighing not less than 60 pounds to the bushel.

No. 1 Canada Western seed oats shall be composed of 95 per cent white oats, sound, free from other grain, and free from noxious weed seeds within the meaning of the Seed Control Act, weighing not less than 36 pounds to the bushel.

No. 3 Extra Canada Western seed barley shall be composed of the six-rowed barley, sound, plump, of fair color, free from other grain, and free from noxious weed seeds within the meaning of the Seed Control Act, weighing not less than 48 pounds to the bushel.

These special grades will be given for the crop of 1915 only on car lots of grain that are inspected into the government interior terminal elevators at Calgary, Moose Jaw and Saskatoon, and the seed will be made available to farmers and seed merchants at the close of navigation or about December 1st. The advance in prices over commercial grades will be just sufficient to meet the extra dockage required and the cost of cleaning, storing and sacking when the latter is desired by purchasers.

It is not anticipated that the operation of these seed grades will perceptibly alter the quality or value for milling purposes of the commercial grades of grain, as cars of grain for seed will be selected primarily on the basis of freedom from noxious weed seeds.—Seed Branch, Ottawa.

Co-operative Egg and Poultry Marketing.

While the activities of the Live Stock Branch of the Dominion Department of Agriculture with regard to the organization of Co-Operative Egg and Poultry Marketing Associations have been largely confined to date to the Eastern Provinces of the Dominion, the need and opportunity for work of this kind in the Western Provinces have not been overlooked.

From the fact that co-operative marketing of poultry products was something entirely new, it was thought advisable to thoroughly test out the practicability of the system before extending it to a wider area. Satisfactory results having been obtained in the east, arrangements are now being made to extend the work to the Western provinces.

The new field to be organized will receive the benefit of the experience of mem who have been associated with the co-operative work since its inception. Mr. T. A. Benson, who for the past three years has been in charge of the co-operative organization in Prince Edward Island is being transferred to the Province of Alberta to fill a position similar to that which he has held in Prince Edward Island.

Mr. J. H. Hare, who has had an extensive experience in this work, not only with the Ontario Provincial Department of Agriculture, but also during the last two years with the commercial and marketing end of the work undertaken by the Live Stock Branch, has been given general supervision of the Egg Circle work being conducted by the branch. Mr. Hare is now in the western provinces and will devote the greater part of his time for the next year to directing operations there. For the present he will confine his activieies principally to the Province of Saskatchewan.

Mr. R. J. Allen, B.S.A., has been appointed to take immediate charge of the organization of co-operative Egg and Poultry Marketing Associations in Manitoba. Mr. Allen has had an extensive experience not only in departmental work but also in the commercial field and goes to Manitoba well fitted to carry on this work effectively.

Mr. Wm. Kerr, B.S.A., who was in district representative work in Ontario for some time previous to joining the staff of the Live Stock Branch, and who has been associated with Mr. Benson in Prince Edward Island during the past summer, is now in charge of the work inthat province. Both during his college course and later, during active work in the field Mr. Kerr has made a special study of the theory and practice of the co-operative marketing of farm products. He enters the work in Prince Edward Island, therefore, well equipped to take up the problems that have developed in connection with the advanced nature of the work at that point.

HORTICULTURE.

Get Your Nursery Stock Through New Brunswick Fruit Growers' Association.

Editor Maritime Farmer:

Placing of Orders.—Arrangements have been made that orders for apple trees and other fruit stock sent in to me by members, after being approved here, will be sent to the local nurseries and filled by them in the spring.

Cost—Apple trees purchased through the Association in this manner will cost 24 cents each, the trees to be well packed and shipped, freight prepaid, to any railway station or steamship landing in the province. Plums, cherries and pears will cost about 35 cents. Orders for small fruits will be filled at prices to be determined later.

Method of Payment.—The nurserymen supplying the trees, **and not the association,** will collect payment making drafts at thirty days from date of shipment, or otherwise collecting payment in that time. Members sending in their orders must be prepared to comply with these conditions of payment.

Members Only Eligible to Procure Trees—Members only shall be eligible to procure fruit trees at reduced rates through the Association. No orders will be sent in to the local nurseries or accepted unless the person sending in the order is already a paid up member of the Association, or unless he joins the Association and accompanies the order with his membership fee of $1.00.

Nurserymen's Guarantee.—The local nurserymen state that they take the utmost precaution to have their trees true to name, but do not hold themselves responsible in this respect further than to guarantee to replace free of charge any tree or trees that do not prove to be true to name, or to refund the price paid for them. They further state that they take the most of their scions from their own trees, and when getting new varieties they endeavor to purchase their scions from parties of absolute reliability. A considerable portion of their scions are collected for them by the Horticultural Division of the Department of Agriculture, from some of the best orchards in the province. In this respect it is well to mention that I do not think any nurseries will assume any more responsibility in regard to trees not proving true to name, than the above. I understand that it is the general attitude of all nurseries on this qeustion.

Replacement of Trees at Half Price.—The nurseries with whom these orders will be placed agree to replace any apple trees procured from them that fail to grow with proper care, at half price, provided they are notified by the first of September following the delivery of the trees, and provided also that the money which represents the half price accompanies the notice.

Inspection of Nursery Stock—The stock in these nurseries has been thoroughly inspected by officials of the Horitcultural Division of the Departpartment of Agriculture, and has been found to be apparently free from San Jose Scale, and is good healthy stock.

Saving in Price.—By ordering apple trees through the Association members will be effecting a saving of six cents or more per tree and a corresponding saving on other classes of nursery stock. At the same time they will be getting local grown stock that has been inspected and which is sold under about as good a guarantee as it is possible to obtain from any nursery. It must be borne in mind that there is always some percentage of loss in nursery stock no matter where it comes from; in fact, this applies generally to the handling of living things.

Orders Should be Placed Imemdiately.—Orders should be placed immediately, and if possible within a day or two of the receipt of this letter. If this condition is complied with, almost any of the standard varieties may be obtained, but the longer the order is withheld the greater the possibility of one or more of these varieties most in demand becoming exhausted.

Write to A. G. Turney, Secretary, N. B. Fruit Growers' Association, Fredericton.

Seasonable Garden and Orchard Hints.

Diseases in the Orchard.—Once the vegetative or growing season is over, the fungi causing apple or pear scab, bitter rot, black rot and other diseases, are at rest just as much as the trees themselves. Left unattended to, the fungi will safely hibernate and be ready for another attack in the spring. Spraying is very effective, but this cannot be done in winter. On open days, there is no reason, however, why the trees should not be examined carefully and all dead limbs taken off, cankers and bark scraped and disinfected, and the trunks and main branches lime-washed. These precautions will satisfactorily assist in the prevention of destructive epidemics.

Strawberries.—In almost every part of Canada where strawberries are grown it is desirable to protect them from frost with a light covering of clean straw or grass. All the covering that is needed in most localities is sufficient to prevent the sun from shining through and thawing the soil beneath when the temperature goes a few degrees above freezing in winter or early spring, as it is the thawing and freezing of the ground which causes much injury. A heavy covering is not desirable, except on the prairies where there is little snow. The covering should not be removed until the plants begin to grow in the spring, as the longer it is left on the less danger there will be from spring frosts. On the prairies, particularly, it is well to leave the covering on as late as possible because of danger from frost. If there is danger of moulding, or if the plants become spindly before it is safe to remove the protecting material, it should be loosened to let the air through so as to dry off the tops of the strawberry plants. In places where ice is liable to lie over the plants it is a good plan to run a shallow furrow between each row in the autumn to ensure a better circulation of air.

Protection from Mice.—During some winters mice are very destructive to fruit trees, even after the latter have been planted several years. Just before winter sets in, wrap ordinary white building paper around the trunks, tying it with twine; mould up the soil a little about the base to prevent the mice entering at the bottom of the paper, and there should be no trouble from them. If this has not been done before the snow has fallen, tramp the snow well around the trees, after putting on the paper, which will prevent the mice from reaching the trunks.

Scions for Grafting.—A good time to cut scions for root-grafting is just as winter is setting in. They may be kept in good condition until wanted by burying them a few inches deep in the ground, preferably in sand, or by keeping them in forest leaves in a cool cellar.

Plans for Spring.—Most of the seed and nursery catalogues appear early in the new year, and the sooner orders for seeds and plants are sent in after the catalogues are received the better the prospects of getting what is desired.

Careful planning of the season's work during the winter months, whether with fruits, vegetables or ornamental plants, will well repay the time and thought thus given. So many things demand attention in the spring that it is not always possible at that time to give the necessary attention to planning details, and often a little forethought will mean the difference between profit and loss.—W. T. Macoun, Dominion Horticulturist.

Winter Protection of Young Apple Trees.

From Injury by Vermin

Precautions must be taken to prevent injury from mice, rabbits, etc. Many failures in apple growing here and elsewhere are caused by these pests and a large annual toll in the form of dead trees is annually exacted by them. As far as possible crops harboring and attracting such pests should be avoided and the accumulation of litter, trash, weeds, long grass, etc., which furnish suitable winter quarters for these animals, prevented. Mice work under the snow and damage from them may be prevented by tramping the snow solid round the tree after the first few snowfalls. This method of protecting is however somewhat dependant on the weather. The cheapest and safest protection is secured by wrapping the trunks cylinder fashion with paper, wood-veneer or some such material. Good strong building paper, as light as possible in color gives good satisfaction. This may be placed round the trees in the fall, not tightly, but leaving an inch or so of space between the inside of the paper and the bark or the tree. The soil should then be mounded up around the bottom of the paper to a height of six inches or so. Veneer tree protectors, made of thin material. one-eighth inch thick, 12 inches high, 12 inches wide, and costing about one cent each will last two and three years and afford good protection. The paper or veneer as the case may be should be removed in the spring, about the middle of April.

From Sunscald.

This form of damage is very common in some localities, so common, in fact, that a tree which escapes it is a rarity. The greater part of the damage occurs in late winter, or during the warm spring days when the snow is going off. During the warm afternoons the sun, reflected from the snow against the southwest side of the tree trunks, becomes very warm. The trunks are thoroughly warmed on that side. They are thawed out, and the bark becomes soft, sappy and pliable. Then, when the sun goes down and the temperature falls again to zero, the bark is again frozen tight. The next day the same thing happens, and so day after day the young bark freezes and thaws, and by this means is torn to shreds. When spring arrives the bark is killed and broken open. Then various kinds of fungi get in and the damage which begins by

Will Pump 1000 Gallons of Water an Hour

No. 1, Price $48.

And pumping is but one of many labor-saving jobs that can be done on any farm with a

FAIRBANKS-MORSE ECLIPSE ENGINE

It can be easily moved from place to place and put to work in a few minutes time—grinding, pulping, sawing, hoisting or any other light work of this nature. In fact, its uses are practically unlimited.

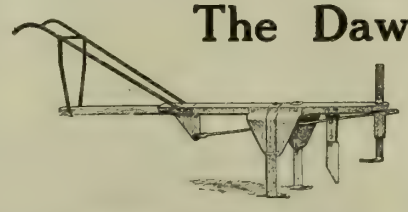
The Dawson Ditch Digger



Price $38.00 F.O.B. Toronto

Will dig 5 feet or more in depth, cutting the ditch 10 inches wide, allowing the use of tile as large as 8 inches if needed. The average cost of ditching with the **Dawson Digger** per 100 feet, which is approximately 6 rods, has averaged up to $1 50 per 100 feet, that is, to dig the drain. lay the tile, and to fill the drain back in again. We do not say that it will cost every farmer $1.50 per 100 feet. or 6 rods, as it has been our experience that lots of drains with the **Dawson Digger,** have been put in under 70 cents per 100 feet. We know, however, that the **Dawson Ditcher,** if handled according to instructions, will pay for itself in 2,000 feet of ditching, whether you figure it against hand or machine ditching.

Write for full particulars, and testimonials from farmers who have used the Dawson Digger.

freezing and thawing ends with spread of canker and other troubles about the trunk of the tree. The best preventives of sunscald are low heads and veneer and paper cylinder protectors. High-head trees, which are of doubtful value anywhere, are undesirable in places where sunscald is bad. The protectors of paper or wood veneer recommended above for mice and rabbits will also give practical immunity from sunscald. This trouble is a very serious one. It is not uncommon to find young orchards ruined by it. In sections where this trouble is prevalent great pains should be taken to protect young orchards from it. For the benefit of the fruit growers, the Fruit Growers' Association has secured a number of veneers and will fill orders for them at cost price. Apply to: A. G. Turney, Secretary-Treasurer, N. B. Fruit Growers' Association, Fredericton.

Fall Work in The Garden.

FALL WORK IN THE GARDEN

Traveling about the country in the late fall, after the frosts have killed all the tender plants, I have been much interested in noting the condition of the gardens. So many seem to think that no more work is necessary after the fullness of summer, except to garner the crops. The litter of vegetable crops, weeds and vines is left to be cleared up next spring when time is limited and moments are precious.

Some contend that the weeds and vines serve as a mulch and help to conserve the fertility. Be that as it may I have practiced the method of clearing away all surplus weeds and vines and placing them on a compost heap, where, with a mixture of muck and leaves, the elements are prepared to be returned to the soil next year. When any vine has ended its career of usefulness it is promptly removed. So far as possible no weeds are allowed to go to seed and in this way fewer weeds appear each year. We believe few gardeners really appreciate how much labor can be saved in this way.

My gardens are covered with a layer of stable manure from the cow barn after everything is removed and this is plowed under in the spring. Vegetables like parsnips and salsify are covered with coarse, strawy horse manure to guard against alternate freezing and thawing. Straw and litter from the stable also serve as an excellent covering for the asparagus and strawberry beds, as well as the autumn-sown spinach. In the spring all the coarse material should be raked away and will serve to build up the compost heap. This compost heap is an excellent fertilizer for sweet corn and has given good results with melons and squashes as a supplement to the manure. It is also the best obtainable material for the greenhouse plants.

In the small fruit patch all dead canes are cut away in the fall, not too closely, but no dead branches are left. If any leaves collect about the blackberry and rapsberry bushes they are allowed to remain and serve as some protection against the frost of winter. Some of the tender shrubs and rose bushes of the border are wound in straw and burlap and we are well repaid by the beautiful flowers each year.

Celery may be banked with earth and left in the rows until after quite severe frosts have occurred. The dirt is drawn up well toward the tops of the plants and a layer of straw or hay spread over the whole patch. At the proper time this is removed and the bleached product taken to the cellar or placed on the market.

One should see that pits for the hotbeds are dug and the frames properly placed in position before the ground freezes. It is something of a task to dig a pit in the winter. It is also well to put a supply of soil and compost where it can be had when needed for filling seed boxes and repotting plants during the cold weather, when the ground is covered with snow.

Free Seed Grain and Potatoes

By instructions of the Hon. Minister of Agriculture a free distribution of superior sorts of grain and potatoes will be made during the coming winter and spring to Canadian farmers. The samples will consist of spring wheat (about 5 lbs.) white oats (about 4 lbs.) barley (about 5 lbs.), and field peas (about 5 lbs.) These will be sent out from Ottawa.

A distribution of potatoes (in 3 lb. samples) will be carried on from several of the Experiment Farms, the Central Farm at Ottawa supplying only the provinces of Ontario and Quebec.

Each application must be separate and must be signed by the applicant. Only one sample of grain and one of potatoes can be sent to each farm. If both samples are asked for in the same letter only one will be sent. Applications on any kind of printed form cannot be accepted.

The destruction by fire of the cereal building at Ottawa, which contained grain-cleaning machinery and a large stock of seed grain for distribution, may make it necessary to curtail the distribution to a certain extent. We shall fill as many as possible of the applications which conform to the rules; but requests received after the end of December will probably be too late. Samples cannot be sent in response to applications (no matter when received) which fail to state clearly the needs of the applicant, his experiences in crop-raising, and the character of the soil on which he intends to sow the seed.

All applications for grain (and applications from the provinces of Ontario and Quebec for potatoes) should be addressed to the Dominion Cerealist, Central Experiment Farm, Ottawa. Such applications require no postage. If otherwise addressed, delay and disappointment may occur.

Applications for potatoes from farmers in any other provinces should be addressed (postage prepaid) to the Superintendent of the nearest branch Experimental Farm in that province.

Easiest Starting Gasoline Engine For Farm Work

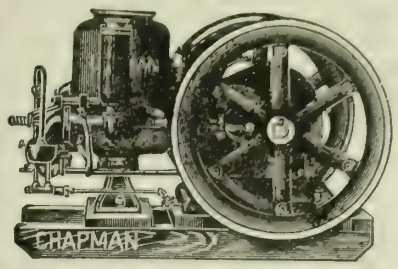
All you have to do is to turn the throttle—give the fly wheel a half turn each way—throw on your switch—and the engine starts. Nothing simpler—nothing better.

Easy to Run—Easy to Fix

Something worn? Want to fix your engine Just undo four bolts, take off the plate containing the whole mechanism (only 20 pieces), do what is needed, put it back. You could not go wrong putting those twenty pieces together if you tried. It is easy to be your own expert with a Chapman Engine.

Chapman Gasoline Engines

Don't like handling machines? 50 cents to $1.00 sends the plate to our nearest branch. We do this work, and save you experts' expenses.



GRINDERS THAT GRIND

On account of our special bearings and high grade plates you get a grinder that grinds fine chop with a minimum of power. Toronto Grinders are the Canadian standard of what a grinder ought to be.

DAIRYING.

Proper Storage of Butter Important.

Nearly every creamery during the course of a year meets conditions which are either to its advantage or which make it necessary to place butter in storage for a week or more at a time. The common custom among creameries is to use the refrigerating room as a cooler and place of storage for butter during the time between manufacture and shipment or sale. Wholesale dealers must use storage to preserve the quality of their purchase whether for a few days or until delivered to the retailer; and left in the refrigerator until it is sold and delivered to the customers. They in turn, either use an ice box or take the chance of eating rancid butter before the pound is consumed. The existing condition then is, briefly, that refrigerating devices are used for butter by manufacturers, dealers and consumers for the common purpose of preserving quality.

The difference between freshly churned butter and the same after storage, providing no foreign odor has been absorbed, is due to changes in texture, in aroma and in flavor brought about by biochemical alterations in the butter constituents. (Average fat 83.75%, water 13.03%, salt 2.09%, casein 0.64%, lactrose 0.35%, ash, 0.14 %, and a trace of acids, coloring matter, aromatic compounds, etc.) That these constituents, except water and salt are subject to alteration through the agencies of various groups of microorganisms is a well established fact and is proof that butter may be the site of many changes.

Buter fat is composed of a mixture of fats—fatty acids combined with glycerin—of which olien constitutes about 35%. The various elements, carbon, hydrogen and oxygen, of which olien is composed are so hitched together in the molecule, the smallest particle which can exist as olien, as to leave a place unsatisfied for oxygen. During storage this place is gradually fillled, changing the smooth-spreading texture of butter to a tallow consistency. Through the agency of microorganisms a part of the lower fats in butter are split during storage into fatty acids and glycerin. These fatty acids thus set free have been thought, until recent years, to be the sole cause of rancidity in butter; but at present many investigators claim that other products of degradation accompanied with the formation of acids from sugar and casein play the important part.

Water, salt and ash are not susceptible to deleterious alterations under the conditions existing in storage butter. A little of the salt and water is lost by leakage and a little water by evaporation. Salt plays the part of inhibiting changes which otherwise would occur; while moisture above 15% encourages both the work of microorganisms and chemical activities.

The alteration in the small amount of casein present in butter which occur during storage are gradual changes from an insoluble casein into cleavage products soluble in salt solution and in water. If this degradation of casein follows the lines of digestion, as would be the case when certain groups of microorganisms are responsible for exciting the changes, no great harm is done outside of impairing the flavor; but if the nature of this change is putrefactive, as certain groups of microorganisms commonly found in milk would excite, the trouble at once becomes serious. There would be formed ill-smelling and foul-tasting compounds resembling spoiled eggs, decayed animal tissue and putrid milk, a trace of which would render a whole tub of butter unpalatable.

The per cent of lactose present in fresh butter whether it is made from pasteurized or from unpasteurized cream is very much the same; representative of the amount of milk serum remaining in the butter. About 7% of the total amount of lactose present in fresh butter is used up during the first ten days and another 7% during a year in storage. The sugar is transformed into acid and flavoring compounds, a change which for the first two weeks is looked upon as a temporary improvement and not as a deterioration.

During the storage of butter the coloring compounds both natural and artificial are reduced to lighter shades, a fading which corresponds more or less closely to the deterioration in quality. Vegetable colors fade rapidly under the influence of light. It also is well known that microorganisms through their biochemical activities are capable of destroying coloring matter, a property which is made use of to an increasing extent in the bleaching of fabrics. While the fading in the color of butter is not indicative of degeneration in quality, yet it does indicate that forces are at play and that these forces may cause decidedly detrimental changes.

The total number of living microorganisms in fresh butter under the deleterious influence of metabolic products, low temperature and salt die off rapidly at first then more gradually until after nine months of storage less than one per cent are alive. That is, there are then about 20,000,000 dead cells per gram of butter or about one gram of dead microorganisms in a 60 lb. tub of butter. The changes excited by microorganisms does not necessarily cease with death; in fact the dead starter bacteria which while alive are considered highly beneficial may after death become exciters of deleterious changes, not as a dead mouse in the well but through the biochemical activities of enzymes liberated after death from the broken down cells. The changes excited by certain groups of microorganisms in butter afe nothing else but detrimental as during their metabolic processes casein is broken up into various compounds, many of which are highly objectionable.

After discussing briefly the changes which occur in the constituents, fat, casein, sugar and coloring matter there remains last but not least in importance the flavoring compounds. The quality of the butter as estimated by the consumer is based largely upon flavor. The buttermaker seeks through the use of a starter to develop in his ripening cream aromatic products which extended to his butter will characterize it as a product of high quality. Flavors and aroma in butter, previously indirectly referred to as products produced from milk sugar and protein by the biochemical activities of microorganisms, are so delicately balanced that the slightest change is sufficient according to the scoring of the judge to lower the score several points and to stamp the butter as a lower grade. These compounds are believed to be ethereal salts, the bases of which are ethyl and butyl ethers combined with lactic, acetic and butyric acids. Through the action of specific organisms any of these compounds may be produced from milk sugar, and less easily from casein. Changes in flavor are gradually being wrought in ripening cream and if a cream is churned while under-ripe these desirable compounds continue to be developed in the butter for several days, thus making it possible for the same judge to sincerely score the same butter after a week's time than when the butter was first placed in the tub. Other aromatic compounds of complex nature are formed during storage and it is to these that the judge applies various descriptive terms. The most common is the so-called "storage flavor" which appears only in old butter, although in this sense butter may become old within two or three weeks. The kind of flavor which develops in the butter is determined almost entirely before the butter is placed in the tub. The flavor of the butter-milk will give a very good indication as to the quality of the butter and also whether that butter will stand up well in storage. The statement of L. A. Rogers, "There is almost always a complication of flavors and probably some sort of sequence of flavors, that is to say, one

"Spot It? Oh dear, No!

There is never the least bit of dust from our furnace—it's a Hecla."

Wouldn't that give you constant joy? Air free from fine coal dust! No sticky soot to float about and soil the wall paper, the curtains, or furnishings! And never an odor of gas! The air comes from the registers, mellow, warm and pure.

There never can be a leakage of gas or dust from a Hecla Furnace. Because of our patented Fused Joints we are able to guarantee that.

Let us tell you more about healthful heating. Keep dust away from your curtains and furniture. Keep pure the air you and your family breathe. Mail the coupon for a booklet on this subject.

HECLA WARM AIR Furnace

Hecla owners save coal year after year, because the Hecla has a patented Fire-Pot with Steel Ribs that get wonderful heating with a little bit of coal.
This is explained fully in our booklet.
You will see it clearly. Send coupon for a copy free.

FREE Book

Would you be willing to hire a "fellow" like this if you saw his advertisement?

JOB WANTED—Willing worker, no board, or time off for meals or holidays; will saw wood, thresh, turn churn, pump water, and all work of that nature. Wages about $5 a month, working 16 hours a day; permanent job. Apply Empire "STA-RITE" Farm Engine.

Wise farmers are solving their labor problems by using gasoline power wherever they possibly can.

With a farm engine you can cut down the number of men on your farm—you have help that doesn't demand more money or quit in the busy season; there is no cost for board and no kicking about long hours.

You have no trouble with an Empire "STA-RITE" Farm Engine. Most gasoline engines require a qualified engineer to keep them running. The Empire "STA-RITE" is the simplest form of power generation by gasoline, suited to the farmer's limited knowledge of machinery.

The Empire "STA-RITE" is easy to start and it stays right without a lot of delicate adjustments.

You won't realize fully all this means to you and to your profit, unless you read the Empire "STA-RITE" Farm Engine Book. That is why we want you to cut out the coupon below right now, fill in at once and mail to

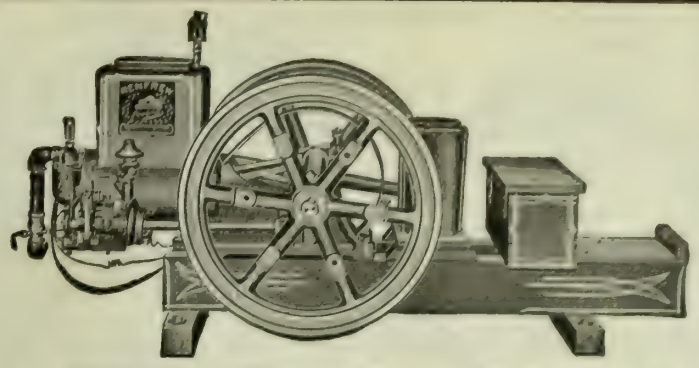
flavor may develop into another, and this in the course of time into a third. The temperature of the storage doubtless retards this transition, and the holding of the butter for some time at one stage makes certain flavors evident." The rapidity with which these changes proceed, or in other words, the stability of the product, is governed largely by the biochemical changes causes by microorganisms in the cream during ripening and the subsequent changes resulting from this activity.

Of the many factors influencing the changes, both the nature and the rate at which they take place, the three most important are the amount of salt, the temperature of the storage and the condition of the cream when churned. Unsalted butter is known not to hold up in storage as well as salted butter, and, too, the results of a number of experiments indicate that a butter heavily salted (3½ to 4%) will not be of equal quality when removed from storage as another sample of the same butter with less salt; that is, the presence of 2½ to 1% salt is favorable for storage butter. Chemical and biochemical changes proceed more rapidly as the temperature rises; and the alteration in butter constituents during storage follows the same general laws as have been experienced repeatedly when samples of the same butter are stored at different temperatures. The lower the storage temperature, until all parts of the butter have been congealed, the slower will alterations occur and from then on the changes are almost negative. A temperature near 0°F. has been proved by numerous experiments to give best results. The stability and keeping quality of butter is to a large extent determined by the condition of the cream from which the butter is made. A cream in which the starter type of bacteria is unable to make further growth is overripe and the butter manufactured therefrom is subject to rapid changes. For great stability of product overripe cream and over-ripe starter are at all times to be avoided. By overripe we mean a condition when the acidity of cream or starter has increased through the activity of the starter type of bacteria to an amount, representing the maximum toleration, which prevents further growth and which inactivates and kills many of the starter bacteria. This condition is reached when the acidity of milk roses above 0.70% (lactic acid determined by "Mann's" method), of 20% cream above 0.56%, of 27 % cream above 0.51%, and of a 34% cream above 0.45%. Then a ripe condition exists when milk (starter) is between the point of loppering and 0.70% acid and when a 30% cream is between 0.39% and 0.49%. Where gathered cream, ripe or even over-ripe when it is received, constitutes the raw material, it is unwise to try to ripen further; but what may be done to a good advantage is pasteurization to kill a large percentage of the bacteria present and to eliminate much of the various odors. Cool, then add 10% or more of good starter (a strain of acid bacteria selected from many because of its desirable qualities), a little under-ripe and hold at low temperature for a short time or until you are ready to churn. The under-lying principles are these: First, that the starter bacteria in cream, providing the acid fermentation of a sweet cream (not a pasteurized sour cream) is controlled by starter, are most active and in greatest numbers when the cream is ripe (a 25% cream with acidity between 0.42% and 0.52%), exerting at this time the greatest inhibitive influence which they possess over other types of bacteria; second, that the fresh, rich, desirable flavors and aromas reach their maximum at the time of greatest bacterial activity; third, that a large number of dead organisms (those killed by pasteurization are not so detrimental as heat destroys with the cell the contained enzymes which are responsible for many of the changes) in the cream together with high acidity renders the butter unstable and subject to early deterioration. —By Chas. W. Brown, East Lansing, Mich., given before the Michigan Dairymen's Convention.



A High Tension Magneto As Well As Batteries

In addition to the regular equipment of batteries the Renfrew Standard gasoline engine is now equipped with a high tension magneto. This means that the Renfrew Standard now has two complete ignition systems, each one entirely independent of the other. With this dual ignition equipment the

Renfrew Standard
It starts without cranking

is a doubly reliable engine—one that comes as near to giving an absolutely perfect service day in and day out, as it is possible for an engine to do.

Do not confuse this high tension magneto equipment with the low tension magneto or dynamo you can procure with some eingines. With the low tension magneto unlike the high tension, you cannot start the engine without batteries. But with the high-tension magneto you can both start and run the Renfrew Standard without the aid of batteries should the latter become weak or exhausted.

With the Renfrew Standard gasoline engine you can now get dual ignition, fly ball governor, bearings running in best babbitt, most economical carburetor built, semi-steel cylinders, and an engine that is considerably larger in size than ordinary engines of same rating. More high-grade features, more metal, more strength, more service, more value for your money—that is what you get with the Renfrew Standard. We include a lever type friction clutch pulley without charge on engines of 6 h.p. and up.

Grain grinders, saw frames and B. Bell & Son ensilage cutters, furnished at very reasonable prices.

Engine catalog, describing sizes from 1½ h.p. to 60 h.p. free on request.

Feeding the Dairy Cow for Best Profits.

I am aware that farmers, as a rule, are not in the dairy business simply for the sake of their health. The cow requires certain specific food substances for certain specific purposes. We may liken the animal body to a machine which, like the steam or gasoline engine, moves itself and may supply power to move other machines. Such an engine requires two things for its operation: First, sufficient repair material to keep its working parts in order; second, a supply of fuel in proportion to the work to be done. These two things—repair material and fuel, likewise constitute the requirements of the animal body.

The machinery of the body is composed of water, ash and protein. These, then, are the materials which must be supplied to keep it in repair. The first of these is found abundantly in nature, so that we need not concern ourselves therewith save to call attention to its importance and to the necessity of supplying it in abundance The animal's body is nearly three-fourths water, while milk is 87% water. This means that unless the water supply is abundant it is impossible for the cow long to continue at a maximum production of milk.

Ash (mineral matter) is especially valuable for growing animals since it is the substance out of which the bony framework is largely composed. Ash, however, is supplied in sufficient quantities in all normally constituted rations. Hence, like water, it may be dismissed from further consideration.

Protein is the most important nutrient used for repair material. It is the substance out of which the flesh skin, vital organs, brain, nerves and the other machinery of the body are largely formed. Since the body machinery is running constantly, whether any work is being done or not, the loss of protein is constantly going on, and must constantly be renewed. Protein as well as ash is needed by growing or pregnant animals to enlarge the working machinery of the body itself or that of the fetus. Moreover, the body cannot manufacture protein for repair purposes out of carbohydrates and fats any more than a machine can manufacture its repairs out of fuel. The body must absolutely depend upon the protein in the food for repair material. Carbohydrates and fat are used in the animal body as fuel to furnish energy to run the animal ma-

Checking Stomach Worms in Sheep.

The infestation of the stomach worm can be held in check by drenching, and there are a number of proprietary remedies (salts, powders, and liquids), which many evidently believe help in keeping the worms under control. Of the drenches gasoline is the one most commonly used by flock owners in the United States (writes W. C. Coffey, Illinois Experiment Station, in the "Breeders' Gazette"). It should be given on three succsesive mornings after the animals have been kept away from all feed and drink for sixteen hours, and after the dose is given, they should be fasted for two or three hours more. Each dose should be measured separately and given in milk, linseed oil, or flax-seed tea. Whole sweet milk, about 5 oz. with each dose for both sheep and lambs, is the medium most frequently employed. One-fourth of an ounce of gasoline for lambs and half an ounce for sheep are the sizes of doses most frequently advised. The writer, however, after considerable experience, has adopted larger doses because they seem more effective. Lambs at weaning-time are given ¼ oz. on the first morning, ½ oz., (one tablespoonful) on the second, and ¾ oz. on the third. Sheep are given ½ ounce, ¾ oz., and 1 o . respectively on succeeding mornings. Just before drenching the gasoline and milk or other medium should be shaken vigorously, in order to have the gasoline mixed with the medium while the drench is being swallowed. It is said that gasoline should never be given with water.

Administering a Drench.

The animal should be allowed to stand while being drenched, as it is less likely to become strangled. It should be backed into a corner or against a wall, and the one giving the drench should stand astride it in order to keep it from twisting about. The nose should be lifted no higher than necessary to get the dose down, for the higher it is lifted the greater the probability of causing strangling. If the drench is given from a bottle, it should have a long, slim neck, which should be inserted at the corner of the mouth. In order not to give the dose too fast ,the bottle containing it should be tipped gently up and down while the drench is being swallowed.

A metal syringe, with a nozzle about 3 in. long and a barrel large enough to hold one dose—that is, milk and gasoline—is a useful instrument for drenching, although the work proceeds a little slower than with a bottle. By placing the dose in a glass graduate, such as druggists commonly use, the gasoline and milk can be thoroughly churned together by working the piston of the syringe. Then, too, when drenching the pressure from the piston forces the liquid so far down the throat that the sheep or lamb does not seem to notice the gasoline. This is an important point, for if the animal is not excited and struggling when the dose is being swallowed it goes directly to the fourth stomach where the worms live; otherwise it is likely to go into the first stomach or paunch, where it will do practically no good.

Other drenches are coal tar creosote and bluestone, or copper sulphate. Coal tar creosote solution is made by shaking together 1 oz. of coal tar creosote and 99 oz. of water. The doses of this 1 per cent. mixture, recommended by Stiles, are as follows:—Lambs, four to twelve months old, 2 oz. to 4 oz.; sheep, 3 oz. to 5 oz. Coal tar creosote, so-called, seems considerably to vary in composition, and this has been a serious objection to it. The copper sulphate solution is prepared by dissolving 1 lb. avoirdupois of pure copper sulphate crystals powdered fine in 9½ U.S. gallons of warm water. It is better to dissolve the crystals in a gallon of boiling water, and then add cold water and mix thoroughly. The dose for a three-month-old lamb is ¾ oz.; for a six-month-old lamb, 1¾ oz.; a yearling, 2½ oz. to 3 oz.; old sheep, 3½ oz. As with gasoline, the animals should be deprived of all feed and water prior to the drenching, if either coal tar creosote or copper sulphate is given, and those treated with the latter should not have water from twelve to twenty-four hours after dosing. But, unlike gasoline, neither of these remedies has to be given on three successive days.

Raising Lambs Free From Stomach Worms.

There is one way in which it is possible to raise lambs so that they will be practically free from stomach worms, even though their dams are badly infested. That way is to raise them in a dry lot—a lot in which no plant is to be found growing. Such lambs have all the manifestations of health, and postmortems show them to be almost free from infestation. Out of a number of stomachs examined, twenty-two was the largest number of worms found by the writer in any individual, and this animal had a wool ball in its stomach. In case of purebred flocks becoming heavily infested, it may be advisable to raise a crop of lambs in a dry lot as in so doing clean, vigorous breeding animals can be secured. Then, too, other undesirable internal parasites may be avoided at the same time.

It is timely to say that the sheep is host to other harmful internal parasites besides the stomach worm. Most animals, man included, are the abodes of many families of nematodes. For instance, there is the nodule disease in sheep caused by a worm (Olsophagastoma columbianum) that causes greenish concretions to form on the intestine. This is a common disease, which impairs the intestinal digesti n. It is so common in the corn belt, in fact, that local butchers have supposed it is natural for sheep to have knotty intestines. But the point we are driving at is that we should not lay all of the sheep's troubles with internal parasites to the door of the stomach worm. And as a rule the stomach worm gets in its most deadly work when it acts in conjuction with some other nematode parasite.

This summer threatens to be a propitious season for stomach worms, because there is an abundance of moisture. That little ensheathed larvae will have easy swimming up the grass stems and blades; so, beware. Shift the flock as much as possible, give it forage crops, and feed it well, for in so doing one better prepares the animals to resist attack. Get rid of the lambs intended for market as soon as they are ready if the price is not bad; drench at least twice, and perhaps three times. Let nobody assume that his sheep do not have stomach worms, for such an assumption is dangerous, and it is characteristic of the man "asleep at the switch."

THE UNIVERSAL CAR

Seasonable Live Stock Hints.

Feeds.—Feed the live stock carefully; the spring pasture is a long way off. Plan to give the pasture a good chance next year by conserving a reserve of roughage for spring feeding.

Laxative feed and exercise are the secrets of successful feeding. Should ensilage or roots be short, molasses makes a very good supplement when fed at from two to four pounds per head per day.

Cut-feed means less waste and greater palatability. Cut straw mixed with the ensilage ,or hay that would otherwise be wasted, cut and mixed with the ensilage and roots is a great saving to the feeder, yet a mixture which is very acceptable to the stock.

Good rations for any class of live stock must be well balanced as to variety and palatability, succulence and nutrition. No two animals respond the same to any one food-stuff; a study of the feeding of individuals is most essential and most remunerative.

Totally Discouraged by Nervous Prostration

After Many Weeks of Doctoring a Friend Recommended Dr. Chase's Neve Food, and She Was Cured.

There is nothing more discouraging than Nervous Prostration. Because of the exhausted condition of the nervous system, weakness and helplessness take possession of the body. The faculties of the mind as well as those of the body are affected and hope and courage disappear.

The patient, often appearing well, gets little sympathy, and few doctors understand diseases of the nerves well enough to treat nervous prostration intelligently. Dr. Chase's Nerve Food is founded on the prescription of a great nerve specialist, and hence its wonderful success in curing ailments of this nature.

Mrs. Edith May Williams, Tillsonburg, Ont., R. R. 3, writes: "I cannot speak too highly of Dr Chase's Nerve Food. I suffered for years with my nerves, and at one time I was confined to my bed with nervous prostration for several weeks. I cannot just explain my feelings, but I was weak and helpless and so discouraged and despondent that I thought I would lose my mind. I doctored with several doctors and received but little benefit. At last I became very much discouraged and thought I would never get better. A friend advised me to try Dr. Chase's Nerve Food, and before I had finished the first box, I knew that it was helping me. It took several boxes of the Nerve Food to make me well and I can truly say that it is a wonderful builder-up of the nervous system."

It is only wise to prevent such dreaded diseases as Nervous Prostration, Paralysis and Locomotor Ataxia by keeping the nervous system in good condition at all times. When you cannot sleep well, have headaches and indigestion, be warned of approaching dangers and restore the nervous system by using Dr. Chase's Nerve Food. 50 cents a box, all dealers or Edmanson, Bates & Company, Limited, Toronto.

Careful, co-operative buying of the necessary mill feeds is profitable, and will lead to healthy co-operation in all live stock operations in any neighborhood.

Make, and keep, at least this one New Year's resolution, namely: to **make every pound of feed more profitable by better feeding methods.**

Beef Cattle.—Don't winter scrub cattle; finish them off now and lose as little money as possible.

Prices warrant raising all the good beef calves.

Why lose money in rearing three- and four-year-old steers when baby beeves and well finished two-year-olds are commanding the top prices Finish beef early and thoroughly.

Winter well the calves and yearlings. Don't lose gains from last summer's pasture, but keep the young stock growing and thrifty; succulent feed is essential for this purpose.

Good beef bulls are scarce; use and keep only the best.

Sheep—Keep more sheep and fewer dogs.

Separate the lambs from the mature sheep and keep them growing by feeding good hay, turnips, and a limited grain ration.

Good preparation of ewes for lambing is as essential as preparing a dairy cow for her lactation period. Don't get the ewes too fat.

The yeaning ewe requires a warm pen; but the remainder of the flock is better in an open-front shed or shelter.

Winter Feeding of Pregnant Ewes.—An excellent ration is composed of clover hay, two or three pounds, and roots, two to three pounds per days. This is sufficient except when ewes are thin, in which case a meal mixture also should be fed at the rate of about a half pound per day. A good meal mixture consists of oats, two parts; bran, one part and linseed oil cake or peas, one part. Ewes lambing in February, March or April should be well prepared with the use of the above ration.

The most economical use of roughages is the secret of successful sheep feeding. If good clover hay is absent, the cheaper roughages must be supplemented with grain. Pea straw, unthreshed, is an excellent substitute for clover hay; pea straw, threshed, must be supplemented with grain. Fine grass hays may require an addition of some coarse grain in order to take the place of clover hay. It would be better to feed coarse grass hays to some other class of stock.

Ensilage may take the place of roots to within a month of lambing, at which time ensilage should be stopped and roots gradually decreased until after lambing.

For feeding sheep, the roots may be either mangels, turnips, or sugar beets, except in the case of rams, where turnips only should compose the root-ration.

Winter Feeding of Lambs—A good ration consists of a mixture of equal parts ensilage and roots, two to three pounds; clover or mixed hay, two to three pounds; and a grain mixture starting at half a pound and finishing at one and a half pounds per day. A good grain mixture for this purpose consists of oats and bran, two parts each; linseed oil cake, one part, to which may be added toward the end of the fattening period two parts of corn.

Swine—The feeding pig not making rapid gains is being fed at a loss. Exercise and succulent feed are as essential to breeding pigs as to any other class of stock. Prepare the sow for the farrowing period. Fine clover hay and whole or pulped roots may be fed advanteously to mature sows and boars.

A warm pen is necessary for the farrowing sow, but a single-board, low-roofed cabin is ample shelter for all other mature pigs.

Good breeding boars are scarce; keep and breed only the best.

Farm Buildings.—Keep the dampness out of the barns. A ventilating system means both a good fresh-air intake and a good foul-air outlet; either of these missing means poor ventilation. Fresh air is essential to all live stock; draughts and dampness in the stables are dangerous and unhealthy.

The comfortable modern stable is not necessarily extravagant, but insures healthy stock, greatest satisfaction and maximum profits to the owner.

The Animal Husbandry Division may be able to assist you with building plans free.—E. S. Archibald, Dominion Animal Husbandman.

The Ram as a Flock Improver.

There is unfortunately less attention paid to the pedigrees of sheep than to those of any other class of stock. Fine-wool breeders cannot be criticised so much as breeders of mutton sheep. Some benefit has been derived from the lack of interest in pedigrees. This has stimulated among some breeders a more rigid and careful selection of the character of the rams used to head their flocks. A poor individual cannot be carried through the sale ring on the reputation made by its grandsires.

It is not the thought to minimize in any way the value of a good pedigree. The careful selection practised by the sheep breeder has led to the building of a reputation for his flock as a whole rather than a particular individual . Thus we hear Shropshire breeders talk of Mitnon, Buttar or Bibby rams instead of Minton's Best and the like. However, it makes little difference how we improve a flock, so long as we accomplish permanent improvement.

Farmers in the cornbelt who keep flocks of grade ewes depend upon the larger breeder to maintain and advance the quality of the flocks. No matter how high-class a flock the pure-bred breeder may develop, he can not improve the quality of sheep in general unless the producers of mutton and wool u > improved rams at prices that will give breeders fair profits.

The farmer with a grade flock does not usually give it much thought until the breeding season is at hand. Then he is busy with the fall plowing and planting, and he is tempted to buy a ram in the quickest and easiest possible way. He may call one of his neighbors and find that he has a likely ram lamb. Probably this lamb was too small and thin to send to the market with its brothers and sisters. Yes, he could be bought very cheap; most discards are cheap.

The Missouri Experiment Station bred a lot of 18 western ewes to a scrub ram, and another lot of 18 ewes to a medium-priced ($30) purebred ram. Both lots of ewes were as uniform as to size, condition, age and quality as it was possible to select them. The ewes and lambs of both lots were treated alike throughout the experiment. On July 7 the lambs were sold at East St. Louis. The lambs sired by the purebred ram at the same age averaged 9.4 pounds per head heavier and sold for $2.85 more per 100 pounds than the lambs sired by the scrub ram There was a difference of $2.12 per head in favor of the lambs sired by the pure-bred ram.

The ewes in this experiment were bred the following year to a Hampshire ram and the ewe lambs were kept in the college flock. These first-cross Hampshire ewes at the age of two years averaged 190 pounds in weight, which was 85 to 90 pounds more than their mothers. The mutton conformation was much superior to their mothers. These ewes had dark mottled faces and ears. The ears were large and shaped like those of the sire. The fleece graded ⅜ and ½ blood combing. The average weight of the fleece was 11½ pounds, which was nearly as much as the combined weight of both the sire and the dam. These first-cross Hampshire ewes were bred again to an unrelated Hampshire ram to drop lambs at the age of two years. The lambs resulting from this cross would pass for purebreds with the exception of the mottled ears found on most of them.

In selecting a ram, keep in mind that the ultimate object of raising sheep is the production of mutton and wool. Different conditions make necessary different types of sheep, so that no one breed or type will fit all conditions. East of the Missouri River the grade flock in the main is bred to a mutton type ram. One likes to see a mutton ram with a strong, broad nose, bold front and a short, strong neck. These masculine characteristics indicate prepotency; that is, the ability to stamp his characteristics on his offspring. A clear skin indicates a vigorous and healthy condition. Excessive fat is not advantageous; frequently it is a detriment. A medium condition of fat is most desired.

The fleece deserves more attention than hs been given it. If one can increase the shearing quality of his flock 5 per cent without injuring the mutton qualities that much is gained. A good shearing fleece should be dense, of good length, and have a soft, elastic feel, indicating a healthy condition. A dead, harsh, dry-feeling fleece should be avoided

The use of a good sire is one of the recognized principles of improving live stock. This principle is fundamental. However, some breeders, through neglect or a lack of knowledge and interest in improved types, use sires which retard the general quality of their flocks and herds. A good, strong yearling ram should be able to serve 50 ewes. A good ram when used on a flock of grade ewes is in many cases more than half the flock, because he will usually have greater ability to stamp his character on the offspring than will the ewes. So with a small flock of grade ewes, worth from $8 to $10 per head, one can afford to purchase a good mutton ram. As the value of the ewe flock increases one can afford a higher-class ram It is economy to have a ram of superior character at the head of the flock.—Howard Hackedorn, University of Missouri, in Breeders' Gazette.

LOUDEN
BOOK OF BARN PLANS FREE
If You Intend to Build a New Barn or Remodel an Old One You Should Have This Book
Louden Barn Plans is not a catalog of barn equipment. It is a complete and valuable book of reference and instruction on barn construction.
The 96 pages of Louden Barn Plans are full of dollar-saving information. It contains 51 representative designs for cow barns, horse barns, combination and general purpose barns, as well as many other designs for hog barns, pens, hay sheds, chicken houses, etc
In addition to the barn plans shown in the book, there are 32 pages devoted to general construction problems, such as concrete work, laying floors, roof construction, ventilation, etc.
When Writing for This Book Please State When You Expect to Build, and How Many Cows and Horses You Want to House
We have designs for nearly 4,000 barns, and our architects will give your letter personal attention if we learn your exact requirements.
Louden Barn Equipment
Louden equipment makes possible a clean, sanitary barn with a minimum of expense. When cows are transferred from dark, dirty barns to Louden barns the milk flow often increases from 15 to 25 per cent, and the labor of caring for the herd is reduced from one-third to one-half. Louden equipment is just as great economy for the man with a half dozen head of stock as for the man with hundreds of animals. The percentage of labor saved is the same.
The Louden Line of Sanitary Steel Equipment Includes:
Litter Carriers
Feed Carriers
Milk Can Carriers
Harness Carriers
Hay Carriers
Feed Trucks
Cow Stalls
Horse Stalls
Mangers
Manger Divisons
Feed Racks
Hay Loft Equipment
Cow Pens
Calf Pens
Bull Pens
Hog Pens
Sheep Pens
Water Basins
Bird Proof Barn Door Hangers
Power Hoists and Other Barn Specialties

THE HORSE

Looking for Defects in Horses.

With a display of keen pride a breeder trotted out what he considered an extraordinarily good two-year-old draught filly. He asked the visitor's candid opinion of her, and expressed amazement at the answer. The disinterested party remarked that if she stood 16 hands instead of 15, and weighed 1,600 lb. instead of 1,300, and had larger bone, and did not have a spavin on her right hock, she would be quite a promising filly. Various excuses were given for her stunted growth with the stereotyped remark that she would grow three years yet and would catch up. The bad hock had not been noticed by the owner and he could not account for it. He pointed out the good big mare which produced this filly and named the stallion which was the sire. Again he was amazed when told that the stallion was not worth half as much as the mare, and was so coarse in his hocks that unsound offspring should naturally be expected. He had not noticed these defects. He bred his big mare to the undersized and inferior stallion because he was near by, and was greatly praised by the owner. Goating over the good points of the filly he had been blind to her defects. Needless to say, that man is not a successful breeder, and never will be. He is too old to start anew and form the necessary habit of critical examination of his own stock. Their merits enchant him; their faults are unseen. He will always be thinking he has splendid horses, and is likely to become offended at others who do not appreciate them so highly.

This man is not alone in his error. The disappointed owners of tail-end stock in all our show-rings are numerous, and most of them complain bitterly of biased judgment, if not unfair discrimination. The successful breeders know better than anyone else the faults of their own animals. That is their persistent and particular study. They know well enough about where their horses should be placed in the show-ring and about what they should bring when sold. From earliest experiences they have made a study of the defects in horses, particularly their own, and that has enabled them to eliminate inferior stock from their farms. Young breeders may take a useful hint from these facts. The temptation is to glory blindly in the merits discovered, and that helps to keep up courage during early disappointments. But resolute search for defects must be made if one is to weed them out. And only by rigid cutting from the very first can one hope in the span of one short lifetime to secure even a fairly uniform measure of merit in the horses ne breeds.—"Breeders' Gazette."

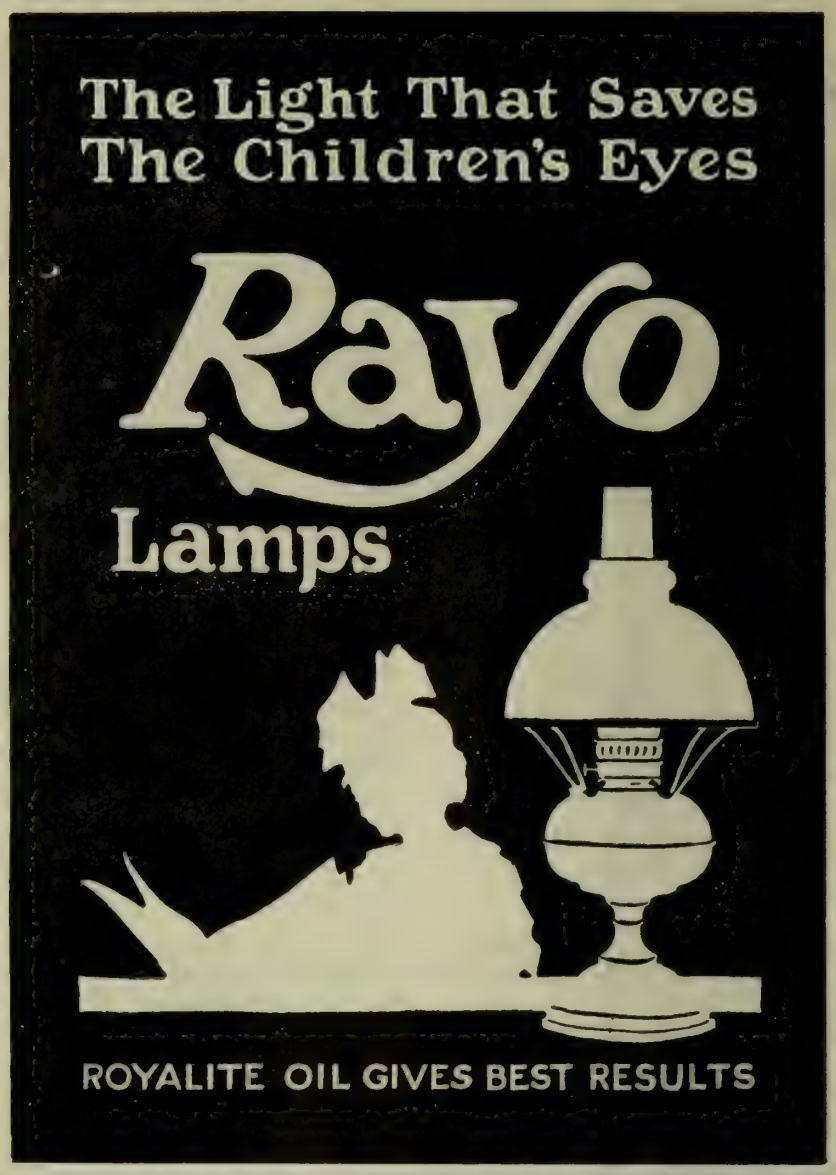
The Rearing Horse.

Rearing is one of the worst forms of vices to which a horse used for saddle purposes can be addicted, it being not only very troublesome, but also highly dangerous to the rider, since there is always the risk of the animal over-balancing himself and falling backwards. Fortunately, the vice is not of very frequent occurrence, but it may be rather easily developed in a young unmade horse through bad breaking or poor horsemanship, which two things are generally the causes to which the vice is due. Once it is firmly established, it is most difficult and more often than not impossible to break the horse of it again; hence, when a young horse is found to be at all inclined to rear, the greatest care should be taken to avoid all occasion of encouraging it to indulge in its rearing propensities by improper methods of management or by the use of too sharp a bit. The young animal must be very carefully handled, and, above all, lightly bitted while it is being broken in and until it has acquired the good manners which a properly-broken saddle-horse should possess. The vice of rearing, when it does occur, is met with practically only in geldings; mares are not given to rearing excepting in very rare instances. Stallions, of course, very commonly possess great rearing propensities, but we are not speaking of them here, as they are not used for riding purposes. In dealing with a horse that is addicted to rearing, the use of a standing martingale is to be recommended. This must be fairly short, and may be buckled either to the nose-band—if one is used—or to the rings of the snaffle (or of the bridoon when a double bridle is used.) By the use of this kind of martingale, the horse's head is kept down, and that to a large extent prevents the animal from rearing, since, in order to rear, it is necessary for the horse to extend its neck and get up its head. When recourse is had to a standing martingale, this must not at first be made too short, but should be put on rather long, as, when a horse is not used to wearing one, considerable trouble may easily ensue if the martingale is made very short to begin with. When the horse has got used to wearing this piece of gear it can be shortened to the required extent. A running martingale—which is the kind generally used—is not nearly so efficacious in preventing rearing as a standing one, but if used very short, it is of some help in checking the habit.

The Gunner Type of Horse.

We need a new breed of horses—a breed of the type of horse that is in most demand as a gunner at the present time. While there are many horses that approach this type, most of them are geratly lacking in quality and uniformity. There will likely continue to be a strong demand for horses of this type after the war, as they are the best type for the southern farmer. One or two of them are needed by every farmer in the United States except those few farmers who are surrounded by hard roads. The farmer who owns an automobile needs them to haul his buggy when the roads are muddy, and the farmer who cannot afford an automobile, needs them, as the heavy drafter is no more adapted for hauling a biggy than is a heavy motor truck for pleasure touring. On the other hand, a 1,200 or 1,300-pound horse of this type can do his share of all ordinary farm work except ploughing and heavy hauling, and can also do a considerable amount of this if necessary.

I am one of the large number of farmers who cannot afford either an automobile or a horse exclusively for driving purposes. I have owned two standard-bred horses with considerable speed and found them very



MATCH SPECIALTIES

We have been making Matches for 64 years now—domestic matches and every other kind.

Some of our specialties are "The Gaslighter" with a 4 1-4 inch stick; "The Eddystone Torch" for outdoor use, (burns 35 seconds in any weather); Wax Vestas for the smoker and many other varieties.

unsatisfactory in the mud. Since then I have owned two horses of the gunner type; they have been able to do their full share of the work on an 80 acre farm, and one of them can haul an enclosed storm buggy through the mud with ease. This is almost impossible for a light trotter, and a draught horse hitched to a single buggy is a joke. One of these horses is in France, and a war horse buyer is after the other one, but will not likely get her, as it is now almost impossible to buy good horses of this type in this locality.

As the automobile has replaced the trotter, so are the tractor and motor truck replacing the heavy draughter. The last to go will be the mule, the horse of the gunner type, and the saddle horse."—Breeders' Gazette.

Grease Heel is Often Caused by Over Feeding Horse.

These diseases are practically identical and might be prevented in a majority of instances. A bad smelling discharge from cracks and sores of the skin between the heels and fetlock joint characterizes "grease heel" and a similar discharge, associated with a growth of few or many grape-like tumors from the skin of the fetlock and the leg above that joint, is the indication of true "grease." The affected leg becomes swollen or "stocked" and lameness may be present as the result of crackling of the skin. The grape formation, and grease, commonly affect horses of heavy draft breed and more particularly those that have long hair (feather") upon their legs. The disease is an indication of coarseness, sluggishness and phlegmatic temepra-ment. Tendency to the disease is hereditary. Grease heel may affect a horse of comparatively light weight and then is not os often a constitutional disorder. While the tendency may be hereditary there is no need of it materializing into an actuality, if proper precautions are taken. It is a common error to blame the breed when a Shire or Clydesdale becomes afflicted with grease. It also is an error to say that the disease never attacks a Percheron, French Draft, Belgian or Suffolk stallion. We have seen cases in these breeds, as well as in the English and Scotch draft breeds; but in all the man more than the breed of the horse, is to blame.

Grease commonly results from overfeeding, lack of exercise and lack of grooming, together with lack of sanitation in the stable. The heavy draft horse is stuffed with rich food, often including boiled mashes and steamed feed which are quite unnatural and unnecessary and often injurious to a horse. Instead of being worked daily, or at least worked abundantly every day, the horse is kept confined in a box stall, or ordinary stall, and too often the stall is in a dark, hot, dirty, badly ventilated stable. Under these conditions the horse becomes unhealthy, the excretory organs are overtaxed and fail to act properly, poisonous matters are retained, the skin becomes foul, lack of circulation induces stocking (filling) of the extremities, the skin becomes itchy and the horse rubs, stamps and bites. Washing is resorted to by the groom and he neglects to perfectly dry the skin. This aggravates "scratches" and helps to induce grease and grease heel. At the first sign of the disease, stopping the rich feed, working the horse daily and grooming him perfectly might ward off the attack, but such treatment rarely is given and drugs are the resort of the owner or attendant.

The hairy legged draft stallion, like the ordinary horse, should either work hard for his living every day, or be made to take abundant exercise every day. His stable should be light, clean and perfectly ventilated. He should have no boiled, or condimental, stimulating feed. His skin should be kept clean and his extretory organs active.

Gombault's Caustic Balsam

The Worlds Greatest and Surest
Veterinary Remedy
HAS IMITATORS BUT No COMPETITORS!

SAFE, SPEEDY AND POSITIVE.

Supersedes All Cautery or Firing. Invaluable as a CURE for

The Lawrence-Williams Co.
TORONTO, ONT. CLEVELAND, OHIO.

If leg washing is done it should always be followed with a brisk rubbing with sawdust to perfectly dry the skin. No drugs, condition powders, or stimulating feeds should be given. Feed the stallion white oats, roots and a little clean oat straw or bright corn fodder, according to the season of the year. So fed, exercised and groomed grease heel and grease will rarely if ever occur.—A. S. Alexander, M.D.C.

An Equine Prohibitionist.

A year ago an owner and groom were hitching a kindly disposed trotter for his race when the blare of a brass band marching by made him take a step or two. A helpful individual, slightly intoxicated. took him by the bit, when with ears back, teeth bared and eyes blazing the trotter downed the unfortunate and but for prompt assistance would have seriously injured or possibly killed the prostrate man. The horse was a recent acquisition and had shown no temper before with his new owner and groom, so the cause of the sudden rage was a subject of anxious thought which had a speedy solution when the next man saturated with alcohol came near him. Then it became the somewhat strenuous job of owner and caretaker to keep the drunken men out of his reach in order to save their lives.

After a winter and stud season on a farm where no one used liquor, the same owner and groom were hooking the horse after his first ride of the year on the cars. A third person, apparently sober, stepped to his head, but quickly got out of reach of the horse's sudden rage. The unmistakable odor of liquor explained the situation and brought to mind the fact that the memory of a horse is his most perfect attribute. The horse had been owned by a saloon-keeper whose great anxiety to dispose of him had been so apparent as to create suspicious, but never of the true cause. Little children play with and pet the horse. Dogs, chickens, cats, all animate things, are safe in his stall, if free from the odor of liquor.

Way of Curing a Halter Breaker.

I have cured halter-breaking from the bronco to the pure-bred stallion. As yet I have failed with none.

My method of halter-breaking is simple. I tie the horse by the neck with a rope which he can not break. The other end of the rope is tied to something that the horse can not move. A bow-line knot is used. It will not slip and choke the horse, and one can untie it as quickly as he can put on a leather halter. This knot can be untied in wet or dry weather, no matter how hard or long the horse has pulled on the rope. If the horse throws himself the rope can be easily cut. This is much safer than using a chain.

One week effects the cure. On the second day the top of the neck is a little sore, if the horse is a bad one, and the little soreness reminds him of the fact that he did not break loose the last time.

POULTRY

Seasonable Poultry Hints.

November.—Early in October the pullets should have been housed in their winter quarters, but if this has not been done do not delay any longer; have all the houses ready and the layers into them as soon as possible now. Make repairs, put glass and cotton in the openings and have everything ready for the pullets to go right ahead. Arrange the house so that the pullets may be divided from the hens.

All surplus cockerels should be disposed of by this time, as well as pullets which are not likely to be fit for laying or breeding purposes, and, of course, all old hens which are not suited for breeding next spring.

Select the pullets very carefully; do not retain for winter laying any but the very best. Market all pullets which are lacking in vigor, are undersized or deformed in any way, and keep only those from which good production can be expected.

Do not move the pullets from house to house or even from pen to pen, at this time of the year; they are very sensitive and the least excitement will mean a loss of dollars by a decreased egg yield. Never allow them to be chased, and particularly do not allow the dog to amuse himself with them.

Adopt system in feeding; have a supply-bin in each pen and in this put a bag or two of mixed grain as required. The mixture may consist of almost any good sized grain raised on the farm. A good combination is wheat two parts, corn one part, oats one part, barley or buckwheat one part; the corn may be cracked or given whole as desired. Feed this morning and night in a heavy litter, making the birds scratch for all the grain they get. In a dry-mash hopper put some dry bran or crushed oats, depending upon the price; leave this before the birds all the time. In another hopper put beef scrap alone, or ten per cent beef scrap mixed with bran. A supply of grit and oyster shell should be available to the birds; also plenty of water, though if milk can be obtained give them what they will take of it as well. Should there be plenty of table scraps and milk, the beef scrap could be left out, but give what will take its place to the pullets rather than to the old hens at this time of the year.

Feed regularly; not just when you happen to think of it; let some one person be responsible for the work.

If it has not already been done, now is the time to see about a special egg-market. It is during the early winter months that consumers find it difficult to get new laid eggs, so that those who have what others are willing to pay a good price for, if they can be shipped direct and with an absolute guarantee.

December.—Go over the poultry house again; make sure that it is ready for cold weather; see that the cracks are all stopped, especially on the north side; provide for plenty of ventilation without draughts. The month of December should be a continuation of the work started and carried on in November. It would be well to market turkeys and geese a week or more before Christmas; see that the breeding waterfowl and turkeys have a shelter they can call their own; don't let them mix with the hens. They do not require anything very elaborate; merely a shelter from the storm.

January—During this month the hens which were pullets last year—the best of which were kept for breeding purposes last spring—will begin to lay. They have not been housed with the pullets nor have they been fed quite as strongly. By the latter part of this month a little beef scrap can be added to their mash; but to keep hens healthy and not too fat, keep them hungry; that is, keep them working for all the grain they get.

February.—Go over the breeding pens; get ready for mating; see that there are no weaklings in the flock. be sure that the male birds are healthy and vigorous, and it is well to keep one or two extra birds in case of accident.

In the American breeds, mate at the rate of one male to ten or twelve females; in the Mediterranean breeds, a vigorous male might be mated with fifteen to twenty females. If the males agree, several can be placed in the one pen; if not, it is better to have a coop for the extra males, keeping only one with the flock at a time.

Upon the health and vigor of the breeding stock will depend largely the success of hatching and rearing during the breeding season. The safest plan is to keep only those with vigor and good constitution, and give them plenty of fresh air and exercise.—F. C. Elford, Dominion Poultry Husbandman.

Picking Out Good Layers.

There are four physical indications of a hen's laying condition, says O. B. Kent, poultry instructor at Cornell University. These are the time of molting, color of shanks, texture of comb and color of ear lobe. The first and third points apply to all breeds, the others only to those having yellow shanks and yellow in the ear lobes.

Good layers molt late and quickly. If you go through the flock the first of October and pick out the hens that are just beginning to molt, or have not started, you will get most of those which are laying.

In yellow skin breeds the paleness of the shanks after a period of laying is a good indication of a hen's capacity. Any bird with bright yellow shanks after a year of laying may be picked out as a poor producer.

Soft, pliable combs are also an indication of good laying condition. When a hen stops laying her comb dries up and becomes smaller and harder, while those which are laying will have soft and pliable combs; not necessarily large combs, however.

In breeds like White Leghorns, which show a yellow cast in the ear lobe, the color fades as the pullets or hens start laying and after two weeks or a month one can quickly pick out the layers by this change of color. It is important to observe the color and shade during the year.

No one of these tests alone is infallible, and maybe not all of them when taken together, but when carefully applied by an observing poultry keeper they should prove a great help in sorting out the flock and picking the good and the poor producers.

Moulting Season.

The fall of the year is the natural moulting season. A hen's ability as a winter egg producer depends largely on how she passes this moulting period.

While the moulting period can be forced and shortened by the use of stimulants, it is usually best to allow it to take its natural course. As a general rule the hens that moult late and quickly are the highest producers and the early moulter is seldom a winter layer.

To grow a new set of feathers is a severe drain on the birds and the nature of the feed at this time is of the utmost importance. The common grains such as wheat, corn and oats fed in sufficient quantities will keep the fowl warm and maintains the body weight, but these grains alone are not enough. The fowls need some real feather making food, rich in protein and mineral.

A mash composed of equal parts by weight of wheat bran, ground oats or berley, shorts and meat scrap will make a very good supplement to the grain ration. The addition of one half part each of oil meal and sunflower seed to this mash will give the new coat of feathers a very sleek, glossy appearance. If the hens do not have full access to some form of green feed it should be supplied. One of the best green feeds is cabbage. At this time of the year cabbage is usually plentiful and the waste leaves and spoiled heads make a valuable feed for the moulting hens.—C. S. Anderson, Colorado Agricultural College, Fort Collins, Colorado.

Farm Poultry Houses.

No particular style, size or shape of house is the best under all circumstances or in all sections. In northern climates with deep snows and strong, cold winds, houses must be built much more thoroughly than further south. There are certain essential points which every house must embody in order to give entire satisfaction.

A good house must be dry, well ventilated, but free from draughts, with a southern exposure, with windows or openings that will provide a good supply of sunlight and protected as much as possible from strong north and west winds. The house must be economical of construction, easy to keep clean and sanitary.

A front that is partially or entirely

GILLETT'S LYE

HAS NO EQUAL

It not only softens the water but doubles the cleansing power of soap, and makes everything sanitary and wholesome.

MR. C. T. LOGAN, R. R. No. 1, Amherst, N. S.

open is shown in the picture, provides good ventilation, a plentiful supply of sunlight, is easy to keep clean and sanitary, and is economical to build. The nearer square it is made, the cheaper it can be built.

A house 16, 18 or 20 feet square of this shape will provide accommodation for 75 to 150 fowls. It shuold be 4 to 4½ feet high at the rear, 8 feet at the highest point, 6 feet where the front part joins the rear, and 3 or 3½ feet in front. Nail an 8-inch board above the front sill to keep out the snow. Cover the space above with inch-mesh wire netting to keep out sparrows.

In severe climates half of the open front can be enclosed in winter with glass and the balance with cloth-covered frames. Across the rear of the building 2 feet from the floor build a platform 4½ feet wide of matched boards, and 9 inches above this place three roosts of 2x4's 12 inches apart on the centers.

Dead Leaves for Litter.

Leaves gathered when they are thoroughly dry constitute the very best litter for the poultry house. There is usually but one time in the early fall when freshly fallen leaves in the weeds and along roadsides are in prime condition for such use. This lasts only a few days, and it is at such times that they should be gathered.

Barrels or sacks may be used for storage, but if an abundance of room is available, it is best to put them away loose. Empty stalls or grain rooms offer the most satisfactory means of keeping such litter free from mold.

If there is anything in which a hen more dearly loves to scratch than rustling leaves we have yet to see it. A flock will work busily all day long in such litter—far more contentedly than in straw. Continual scratching reduces the leaves to a mass of powdery mulch in which condition, bearing a generous amount of droppings, it becomes a splendid product for the home garden. Not only is such a soil dressing of some fertilizing value, but it provides a large element of humus which is of great worth.—Orin Crooker.

The Poultry Breeders' Opportunity.

Canada in past years has imported more poultry and more eggs than she has exported. Yet her production has materially increased, but it has failed to keep pace with the consumption. In twenty years the egg production developed from 64,499,241 dozen to 123,071,034 dozen, but the consumption increased from 11.8 per capita to 17.39. That is to say the individual fondness for eggs had increased over fifty per cent. The population grew in those twenty years, or from 1891 to 1911, according to the census, from 4,833,239 to 7,204,838, an increase of 2,371,599, and the egg production mounted up 58,571,793 dozen. In spite of this fact, and although the exports fell about to zero, 2,378,640 dozen had to be imported. In the same time the number of poultry in Canada grew from 12,696,701 to 29,548,723. Here again, although the increase was close upon thirteen million, the imports exceeded the exports in value to the amount of $111,696.

Last year, the excess of imports of eggs over exports reached the virtually enormous total of 11,150,106 dozen, while of poultry in 1914 we exported in value $206,370, but we imported $406,366, a difference against us of $199,966. These figures, striking as they are, and almost impossible as they seem, are yet official, being taken from Pamphlet No. 7, of the Poultry Division of the Dominion Department of Agriculture, entitled, "The Egg and Poultry Situation in Canada, with notes upon the possible effect of the war upon the Development of the Industry," by W. A. Brown, B.S.A., M.S., and can be verified on application for the pamphlet to the Publications Branch, Department of Agriculture, Ottawa.

The statistics given in the pamphlet are both phenomenal and interesting. No other articles of food have shown such an increase in popularity. At the same time prices generally have increased and been well sustained. Mr. Brown does not undertake to explain the phenomena, but contents himself with proving that it is so and that the increase in every particular is common to all the provinces. He also gives particulars of imports of poultry into Great Britain, which in 1913 amounted in value to $5,411,684, of which Russia supplied $1,640,923, the United States $999,890, Austria-Hungary $470,767, Italy $410,902, China $219,472, Egypt, $130,300, Holland $121,739, Belgium, $108,268, Norway $68,960, Germany $58,005, and Canada, seemingly, nil.

From the foregoing figures and the general condition of things in Europe, Mr. Brown arrives at the conclusion that Britain will this year be short of eggs and poultry to the amount of a million and a half of dollars, or of eggs alone to the sum of one hundred million dozen.

Rhythm of Fgg Production.

Where it is possible to trapnest for at least thirty days, much can be told of a hen's value as an egg producer by the rhythm of egg production. The number of eggs produced by a hen without missing a day is called a cycle.

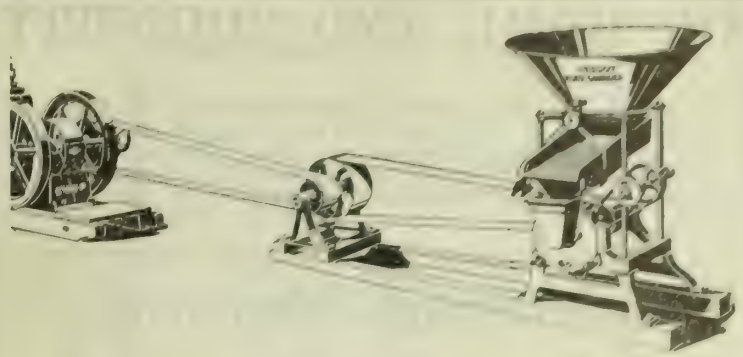
The number of eggs in each cycle tells whether the egg organs have the ability to produce eggs rapidly and the frequency with which these cycles are repeated tells whether the hen has a constitution which will stand up under the strain of heavy egg production. In other words, the number of eggs to the cycle tells the hen's breeding and repeating the cycles tells of the constitution.

If a hen lays four or more eggs to the cycle and repeats the cycles with only one or two days missed, she is a good hen. If a hen lays three or less eggs to the cycle and misses two or more days between the cycles, she is of little or no value as a egg producer.

The hen which lays 20 to 30 eggs in one cycle then misses 10 or 15 days should be classed with the hen which lays regularly, but lays only one or two eggs to the cycle. The first has well-developed egg organs with a weak constitution, while the second has a strong constitution and weak egg organs.

This method of selection is of value where the hens are trapnested for only two or three months during the breeding season or if a hen has been two or three months during the breeding season and should be killed, the rhythm of egg production would give an idea of the value of the offspring.—C. T. Patterson, Missouri Poultry Experiment Station.

Cockerels designed for the market should be prepared in the shortest possible time as the greatest profit is secured by marketing the fowls just as soon as they are ready. Leghorns and the lighter breeds should be sold as broilers as soon as they reach 1¼ to two pounds, as beyond this weight the gain is not made at a profit and the birds soon become hard and "buddy." The heavier and slower maturing breeds can be marketed as broilers, fryers or as soft roasting chickens, but in either case they should be made ready as quickly as possible. Fattening in pens has been found the most economical method of preparing broilers for market.



Vessot Feed Grinders

WHAT better recommendation than this could a feed grinder have—"It grinds flax, barley, corn, crushed ear corn, oats, wheat, rye, peas, buckwheat, screenings of any kind of mixed grain or any other feed stuff, fine or coarse as desired, and removes foreign substances."

"It grinds all feed stuff"—because of its excellent grinding plates. So well known are the original **Vessot** plates, and so highly regarded by all who know them, that imitations are appearing. To insure our customers getting genuine plates, we have arranged to have the trade-mark, "S. V.", placed on every genuine **Vessot** plate so plainly that you cannot go wrong. Look for the "S. V."

Vessot grinding plates do their work so uniformly well that a clean, satisfactory job is assured. The two-sieve spout removes all foreign matter, from nails and stones to dust and sand. One caution only—use steady, reliable power to drive a **Vessot** grinder, such power as is furnished by an **International Harvester** oil engine—**Mogul** or **Titan.**

Buy a **Vessot** feed grinder in the size best suited to your work and a **Mogul** or **Titan** oil engine to run it.

See the I H C local dealer, or write to the nearest branch house for full information.

A Militant Measure.

By Emma Clayton Seabury.

If you do not like things as they are in my home, you know what you can do, Esther; leave them. I can doubtless get another cook. These things have been good enough for me and mine for a quarter of a century. A city school-teacher cannot metamorphose country living in a day, or a year, or ever. We may as well understand each other, and stop talking."

"But, Arthur, have you forgotten we talked all these improvements over before I came—the things most needed for comfort, and those desired for beauty? Does a promise mean nothing after a marriage ceremony?" Her cheeks were aflame, her eyes flashing through indignant tears at the injustice of it all.

"No, I think most of us lose our heads before we are married; we get down to common sense after."

"Then you mean to say that you do not intend I shall have a new stove this winter? That I must endure the smoke and discomfort of this old one, which spoils half the things I attempt to cook and bake?"

He shrugged his shoulders. This hot-headed woman needed discipline. "Times are close; we can get along very well, Esther, and I hate scenes. Let us have no more."

"Times are close because you are close, Arthur. What is forty or fifty dollars in the bank at three per cent, to a woman's comfort and happiness? You love your money more than your wife, and so you shall enjoy your money!"

She turned and went into the house. The afternoon sun streamed through the windows, and there was a gold and crimson gleam in the vines which she fastened back on their trellis. The trellis she had made. How beautiful and peaceful the country landscape lay in its sweep of upland and meadow, of forest and hill. The spire of the village church seemed to hang like a star in the misty silence—everything at rest but her own tumultuous heart.

She had been married a year. She had left her well-paying position as a city teacher for the home of this farmer whom she had met the summer before at a resort near. She was so tired of teaching she almost disliked children sometimes—so tired of the noise and smoke, the bustle and hustle, the drudging routine, and she longed for a home of her own. She had buried the little romance of her girlhood's love years ago, and was the sweeter and better for it, anl she took all her enthusiasms, her ripened experience and judgment, her mature womanhood and its disenchantments, to her new life.

Her husband had always been kind and sympathetic, except when the money question came up. Then he froze up and disappeared as soon as possible.

His first wife had lived and died in the same small economics with which she had commenced her married life, when economy was a necessity. As he prospered and accumulated, barns and storehouses were added, cattle, horses and carriages—anything for his own convenience and pride—but the old house remained the same.

He had papered a couple of rooms before he had married, and promised all the improvements Esther wished should be under her supervision thereafter. So she had waited and hoped, but the time never came.

When Esther had seen the new paper she had recoiled from its hideousness, and as soon as possible, not to seem unappreciative, she and the hired man peeled it off and calcimined the walls. She said it was to match the rug, which she had woven from the cabbage-rose wreathed carpet that was a nightmare to her cultivated taste. So she had used up all her savings, and school-teachers can have very few, if they meet the demands upon them in the poorest paid of all the professions, the most exacting and nerve-racking.

There were white muslin curtains at the windows and dainty bedding, instead of heavy patchwork quilts. She had worked hard to make the home what it was, and had it so changed that she was no longer ashamed to have her friends see it. She had trusted him for the necessities, and she had coaxed and pleaded a year for them, to lighten her work, to which she was all unused—but all in vain.

She had no more money, and finally she had decided to bear it no longer. She felt she had spoiled him in supplying what he would not, and that he must loosen his purse strings for necessities. She had come to a point where her judgment told her she was catering to his selfishness and laying up trouble for her old age—hence the final appeal this morning and the cutting words and taunts.

She was aroused from her bitter musings by the postman's whistle at the gate. She brushed away her tears, and hurried down the walk over which the trees arched lovingly, to the letter box, the only link between her and her past.

She gave a little cry of joy at the bunch of letters and gifts awaiting her from city friends. They were full of loving remembrance of her birthday which had been yesterday.

Arthur had forgotten till evening, and then they had driven to town, where he had invested in a fifteen cent box of candy.

Here was a box of Huyler's, a dainty apron and handkerchief, a cushion cover, a scarf and lovely veil, with cards from the teachers and some of her old pupils. What would they all think if they knew how he had talked to her that morning

Then she opened the last letter:

Dear Esther:

I am going abroad for a year. If only you were here to take my place, we all say, it would be ideal. You had better come and let the old farm run itself for a year, for Esther, with my salary you could save enough to make your home prettier and more inviting.

Forgive me, dear, but I saw this summer how things are. You are a dear, brave girl, and you did not mean I should see, but I am not blind. Maybe it pays to give up all you have of the graces of life for board and washing, part of which you do yourself, but I think it is very doubtful. Sometimes a stingy man needs a wholesome lesson to open his eyes to the value of a wife like you. This is not an age for a woman to endure what she was never meant to endure—being a drudge, without the modern conveniences of even a city slum apartment.

Come and take the school, and I shall leave, feeling my work is in good hands. I must know at once, so please answer without delay.

Lovingly, Adelaide.

Here was a way out. He had told her to take it, or cease to complain. She knew men better than a year ago, and that sometimes a man's respect for a woman increased in proportion to her money independence of him. It mattered little whether it was thoughtlessness or penuriousness, patience had ceased to be a virtue.

She had the individuality and quick decision which teaching develops, and she was not used to being ruled in a dogmatic manner. She had renounced everything for love's rule, and had it been wisely administered, she would have asked nothing better, but she felt she had nothing further to expect from her husband, except a repetition or refusals of what she needed.

Dear Adelaide:

I will take the school. Keep the place for me. I shall go to the city tomorrow.

Sincerely, Esther.

She put it in the box and saw the postman take it out. She breathed a new sense of freedom and went back to her kitchen stove, and valiantly labored with it, prpearing the evening meal.

"Mother, where are you " cried a voice from the door. Her heart sank. In her absorption she had never thought what this would mean to Lucy, and she loved her step-daughter dearly.

"Here, my dear, in the kitchen."

"O, how the old thing smokes! It is a shame you haven't a new stove. You must have one. When I grow up you shall have everything you want," and the girl kissed her stepmother passionately. There were tears in Esther's eyes as she kissed the dark-eyed sensitive girl—but the step was taken; she could not go back.

The supper table was decorated with autumn leaves and was unusually attractive and there was a good hot supper. Esther tried to seem lighthearted and happy. Arthur sulked and said little to her and Lucy, who was bubbling over with spirits. He was injured and he inteded to prevent any more scenes. He would be so disagreeable she would not dare again. How little he dreamed she was unafraid of any man.

After supper she helped Lucy with her lessons, and they talked of the city school and its advantages, and how some day Lucy would be in one worthy of her. They went upstairs, and still not a word from her husband. She tucked Lucy in bed and kissed her. "What a grouch Daddy has on tonight. What is the matter?" asked the girl

"Some business trouble probably," replied her mother.

She went into the guest room she had made so dainty, and locked the door. She pulled out her steamer trunk and packed it, then packed her big trunk in the closet. After that she went downstairs, but Arthur did not look up nor speak, and so she went back and slept in the guest room, and was conscience-stricken that she dreamed a dream of freedom.

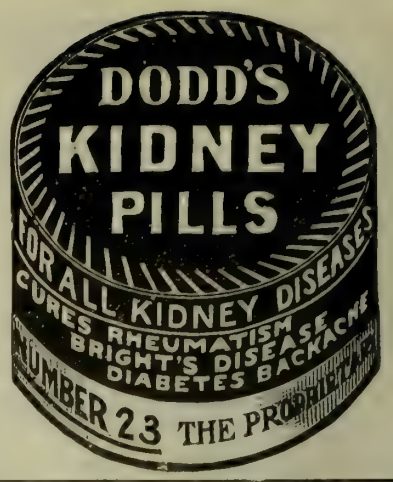
At breakfast she was smiling as usual, but her husband was glum and silent.

"I am going to town; I shall not be back till ten o'clock," he said, after the meal was over, but without looking at her. Usually he asked her to go with him, when he expected to be gone all day.

"All right. But Arthur," and there was a little break in her voice "won't you kiss me goodby?"

He did not seem to hear, nor did he look at her as he went off gloomily. She turned to Lucy and helped her off to school, and then broke down and cried as if her heart would break.

After a while she bestirred herself and made the house tidy, and then she went over to her nearest neighbor. Aunt Mattie was an old maid cousin of sixty-five, who had introduced her



TWO WOMEN SAVED FROM OPERATIONS

By Lydia E. Pinkham's Vegetable Compound—Their Own Stories Here Told.

Edmonton, Alberta, Can. — "I think it is no more than right for me to thank you for what your kind advice and Lydia E. Pinkham's Vegetable Compound have done for me.

"When I wrote to you some time ago I was a very sick woman suffering from female troubles. I had organic inflammation and could not stand or walk any distance. At last I was confined to my bed, and the doctor said I would have to go through an operation, but this I refused to do. A friend advised Lydia E. Pinkham's Vegetable Compound, and now, after using three bottles of it, I feel like a new woman. I most heartily recommend your medicine to all women who suffer with female troubles. I have also taken Lydia E. Pinkham's Liver Pills, and think they are fine. I will never be without the medicine in the house."—Mrs. FRANK EMSLEY, 903 Columbia Avenue, Edmonton, Alberta.

The Other Case.

Beatrice, Neb.—"Just after my marriage my left side began to pain me and the pain got so severe at times that I suffered terribly with it. I visited three doctors and each one wanted to operate on me but I would not consent to an operation. I heard of the good Lydia E. Pinkham's Vegetable Compound was doing for others and I used several bottles of it with the result that I haven't been bothered with my side since then. I am in good health and I have two little girls."—Mrs. R. B. CHILD, Beatrice, Neb.

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

to Arthur. She had kept house for Mr. Stilson after his first wife's death, and taken care of Lucy, and had a heart big enough to mother the world. She loved Esther as if she were her own daughter.

"Aunt Mattie," Esther said huskily, "I want you to go over and take care of Lucy and the house. I am going back to my school."

Then she broke down again and buried her face in Aunt Mattie's lap.

"Oh, Esther, is it as bad as that You know, dear, I told you of his peculiarities. He seems stern and autocratic, but he has the bst heart in the world, though he makes grave mistakes. He sent his two boys away from home without a penny, he shortened the life of his wife, and now you are going away. When will he learn his lesson? You thought you could manage him A man—yes, and a woman, too—is sometimes like a mule. He needs a beating, metaphorically, to make him wake up to see things. But this will break Lucy's heart!"

"Oh, that is what breaks mine. Aunt Mattie. But I shall send for Lucy soon if he will only let her come."

"Why not take her with you, Esther?"

"I dare not do that. My life is my own, but she is his, and he loves her in his own way."

"Please send your man over for my trunks, and Aunt Mattie, I shall have to borrow money to go. I haven't a penny. Think how hard it has been for me to beg for a postage stamp. But that is over now. In a month I shall pay back with interest," and she kissed her tenderly.

"Yes, dear, all I have is yours, though it is not much, you know. I will do the best I can for them, but I dread it, Esther."

At noon the sorrowful wife went to a town in an opposite direction to the one her husband had taken, leaving the following letter for Lucy:

My dearest girl:

"I am going away to take my old school for a while, but how my heart will ache for the dearest girl in all the world! Take good care of Aunt Mattie and Daddy, and remember, you are the home maker now. I shall send for you by and by. Be brave, dear, if you love me as I love you.

Lovingly, Your Mother."

To Mr. Stilson she wrote:

Dear Arthur:

I have taken you at your word, and have gone to teach Adelaide's school, while she is abroad. Aunt Mattie will care for you. Be very tender with Lucy, and let her come to me soon. I am sorry that you would not kiss me goodby.

Sorrowfully, Esther.

Lucy had read her letter and cried herself into a sick headache before Mr. Stilson came home. He read his letter, with white face and tightened lips, and then went upstairs without a word. Later he stole into Lucy's room. She was wide awake, and flung her arms around his neck and sobbed hysterically.

"There, there," he said huskily. "Don't ,Lucy; please don't, I cannot bear it."

But the child paid no attention to him. "If you had done what you promised she would never have gone away. What shall I do, oh, what shall I do? I know I shall die; I mean to!"

He turned away in despair and called imperiously. "Aunt Mattie, come up and quiet this child, if you can." Then he went into his room to battle with himself, and to think more deeply than he had ever done before.

Meanwhile, into the city, every street of which was so familiar, swept the train bearing Esther without her dreams. She went to the family hotel where she had lived for ten years before her marriage, and was not, as her conscience told her, nearly as miserable as she ought to be.

She explained nothing and no one questioned the dignified, reserved little woman. It was easier in the city among tragedies than in the quiet country life. She was only one of many here, and she knew that in her work and her love of it, she would lose herself. She was hungry for libraries and pictures, for lectures and concerts, for her church and friends—all of which she had so gladly given up for marriage, and a drudge's place in a kitchen with a smoking stove, she said to herself bitterly. Arthur had never loved her. He only wanted a housekeeper for himself, and a caretaker for Lucy. Aunt Mattie would do just as well.

Her work seemed easy after the farm work, and she loved it, but her heart ached for Lucy and the love she had idealized.

Next morning Mr. Stilson ate his breakfast in silence. Then he asked Aunt Mattie. "Did you lend Esther money to go to the city?"

"I did; she hadnt' a penny of her own," replied Aunt Mattie.

He handed her a twenty-dollar bill. "Is that enough? I prefer to pay you."

"That is what she borrowed, but I think she'd rather pay me herself."

He threw the bill on the table and strode upstairs. Lucy's room was cold and she was huddled down in the comforts. He remembered how Esther had urged him to run a pipe from the dining room through Lucy's room, and put a drum in it. Lucy did not move, and he bent over and called softly: "Lucy dear."

She flung a hand out at him to push

him away and then she burst out between sobs: "Don't come near me, Daddy. I have been awake all night, thinking how you have sent her away, and I cannot love you any more. She was so good to us, and worked so hard, and you wouldn't get her a stove, or put in a sink, or a new floor, or get the wood cut, and piled in the shed, and put the pump in the kitchen. And now she doesn't have anything to do but teach, and she gets a hundred dollars a month. She doesn't have to get breakfast, or make fires, or anything, and her room is warm. Of course she will never come back. She would be a fool. You never gave her a penny, and I cannot love you, Daddy, to treat her so, and I know I shall die!" She covered up her head and burst into uncontrollable sobbing.

Mr. Stilson was appalled at this tiny rebel. No human soul had ever talked to him like that before. He was conscious he should scold and punish her, but he had no nerve left. He only pleaded "Lucy, Lucy," and left the room in despair.

"Aunt Mattie, get Lucy down here on the couch, where it is warm, and get her some breakfast."

He remembered how days and weeks after her mother's death when she had drooped lower, and lower, he had thought he should lose Lucy too. Then how she had blossomed under Esther's care and love. What could he do He went out and hitched up the horses, but he felt ashamed to meet his neighbors. What would they think? She might at least have asked him to take her to the train, and not have shamed him utterly. He felt angry and bitter, but crushed and alone.

He drove away without any definite object. Then he stooped at the house of a carpenter, and asked him to look in some time about some repairs. He ordered the hired man to cut some wood and pile it in the shed for Aunt Mattie. He wished Esther knew.

At noon Lucy lay still and white on the couch, a hot stove plate at her feet, her head wrapped in a cold compress, which she pulled over her eyes when her father came in. She had eaten nothing, nor did she speak or move. The storm was spent, but she was exhausted and ill. At night it was no better, but next day a big fat letter came for Lucy, and there was a box of candy, and tiny handkerchief with her name on it, and Lucy sat up and smiled.

Among other things Esther begged Lucy to be brave and sweet, and to help make a home for Daddy, and help dear Aunt Mattie. She told her of her room, and how her desk was piled up with flowers, and how glad her friends had seemed to see her. She had been to a concert last night, and was going to a lecture tonight, but she missed her dearest girl every moment, and would send for her soon, if Daddy was willing.

Lucy cried tears of joy over it, and every day thereafter came a letter to her or Aunt Mattie, but not one word for her husband. He stole the letters and carried them to his room every night and read them, but found scant comfort.

Lucy blossomed under love and hope again, and went to her little country school, Aunt Mattie mothering her as best she could. They spent their evenings together, or talked or read apart, while Mr. Stilson pored over his paper. He was silent, knowing Lucy had not forgiven him, and they never spoke of Esther.

Before Thanksgiving Esther wrote to Arthur, begging for Lucy for a week. She said: "I will meet her at the station, and also see her off, and pay all expenses." He winced at that word "expenses," and told Lucy to write her mother that she could go, but that her father was able to pay her expenses.

Such a flutter of joy as Lucy was packed off in. Such a beautiful time as she had with Esther, for the city was like a fairy tale to her. And such a lonesome Thanksgiving as Aunt Mattie and her father had. He wrote to ask if Lucy needed money, but did not enclose any, Esther noted and sighed.

Lucy was too much her father's daughter ot make any sign of contrition when she left him, but Esther insisted on her writing home twice a week. She stayed ten days, and was to go back at Christmas with Aunt Mattie, so the time flew by swiftly. Esther hoped against hope that in the Christmas spirit Arthur would ask her to come home, though she intended to refuse and work the year out. She had also made up her mind that she

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of **ill-health**, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience,** we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. **If you suffer from pain in the head, back, or bowels, feeling of weight** and **dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid,** to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers** of **Daughters,** I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day,** as you may not see this offer again. Address:

MRS. M. SUMMERS. **BOX 309, WINDSOR, ONT.**

would insist on his coming to her.

When Lucy came back she talked of nothing but Esther and the city, and a great pang of jealousy pierced her father's heart. But he steeled himself against it, and shut out her innocent prattle to Aunt Mattie, while he wrapped himself in his own bitterness.

Christmas came and went, and still he made no sign. Esther sent for Aunt Mattie and Lucy, and made them the happiest people in the world, Mr. Stilson declaring he was going away too, and insisting on their departure. He really went to a church dinner, and was asked so many questions about Esther and Lucy, that he left early, pocketing his wounded pride.

To make matters worse, his oldest son came home, to find his father keeping bachelor's hall in the smoky kitchen.

"What under the sun is the matter with you anyway" said he. "That woman is fit for something better than an old rat trap of a place like this. She is a fool if she ever comes back. Do you mean to stay here alone the rest of your life?

"Joe and I would have gone to the dogs, very likely, if Uncle Harold had not made men of us. Now you've quarrelled with Lucy and Esther.

"Say, why don't you tear down this old house, or move it back for the hired man and build a neat bungalow Leave Lucy with Esther for the winter, and surprise them next summer?"

"When I want your advice, Dick, I will ask you for it!"

"No charge, Daddy. Now come back to town and get a square meal with me. You said you thought you would sell that twenty-five acres of pasture land. I've got a scheme. I have some plans with me I drew up for a friend of mine—the cutest little house, and not so small either. We will look them over after dinner."

"You need not trouble yourself, Dick."

But they went to town and had a good dinner, and Dick rattled away in his good-natured way.

"It makes me laugh, Dad, to think how terrified I used to be when you bluffed me, and how I kept silent a long time in consequence. But Dicky is never bluffed nowadays."

"I am not an architect for nothing. Now look at this house. And the beauty of it is that it won't cost more than three thousand, and look what you get!"

So they talked everything over, Dick battling for all modern improvements, and winning out every time. He also suggested that Lucy remain with her mother and go to school with her for the winter.

The next day they rode around and interviewed contractors and workmen, and had a really very chummy time, the first since Dick left home. "And all because I am no longer afraid to beard the lion in his den," Dick chuckled to himself. "Of course, Esther will win out."

"Dad, Joe and I are going to educate Lucy, and have you and Esther come and keep house for us some winter in the city."

"I think I can manage Lucys' education without your assistance, young man," his father returned sarcastically.

"All right, then, but she is a beautiful girl, and she shall have the best; we have decided that."

So Lucy stayed with Esther, to the great joy of both, and a check came for her board and clothes. And Esther for the first time cried over that check.

Aunt Mattie went back to the lonely house. Winters always go by somehow, the cold and snow, the shut-in days, the short gray days, the blustering and sleet, in the country. In the city they were as paradise for Lucy.

When the May sunshine came, Esther drooped in the confinement of her school work. She longed for the country in May, the apple blossoms, the velvety green everywhere. And she loved the chickens and the frisky lambs, the cattle and horses. She longed for the rides, and the freedom of it all. Still Arthur did not write to her, but he asked the date of the closing of the school, and said they would of course spend the holidays with him. Black Dinah would be there and do the hard work, and Lucy and Esther could live outdoors and rest.

"You will go back with me, mother dear. I cannot go without you," Lucy pleaded.

"I hope to, dearest," was all Esther could say. Once she said, "You know I can never go back to that old stove and the hard work again. You would not want it, Lucy."

And Lucy answered quickly, "No, mother, I never shall ask you."

The girl wrote passionate, pleading letters to her father, which no one saw but him, and he finally wrote her: "Don't worry, little girl. We are going to have the finest summer you ever had."

Then Lucy wrote: "I cannot go without her, Daddy, and she will never go till you ask her. You must make the home nice for her, for she is right and you are wrong, Daddy dear. If you love me, you will do as I say."

Aunt Mattie seldom wrote, and then told them very little.

Finally the closing day of school came. The teachers were all gathered together talking of the summer's plans

Knowlton, Que. Dr. True

The Rule of Kindness.

(By Graham Hood).

"Kind words are the music of the world," said Father Faber. Kindness adds sweetness to everything. Turn back the leaves upon which you have written the story of your own life! Is it not true? Have you not found that the greater part of your unhappiness has been due to the conduct of other people? Can you not truthfully say that the wrost hours you have had to bear are those which other people have caused? The thought and acts for which we ourselves are responsible bring pain enough, but we can always find relief from them by selecting a wiser course and avoiding the old mistakes in the future. Against the conduct of others, however, we have no such defense. Though we may accept the blow philosophically, and may—metaphorically, at least—turn the other cheek, the hurt is felt deep down in the heart, and we suffer—more poignantly, perhaps, because we have so successfully concealed the pain.

It is this very fact—the fact that unkindness can bring so much woe to the hearts of others—that should make us strive to master the art of being kind, a purpose that may be attained more easily than one might imagine. All that is necessary is that we should apply the principles of the Golden Rule to everyday affairs. By doing this we should naturally be compelled to put ourselves in the place of other people, a point of view that must of necessity be taken if we are to treat other persons as we wish them to treat us.

A man, or woman, who can—in imagination—change places with others will gradually overcome the habit of judging others, and few acts of which we are guilty cause more pain and sorrow in the world than this uncharitable practice. We know by our past experiences that it is not always possible to judge a man's motives by his actions. We know—by experience, too—that our unkind judgments have frequently proved themselves unjust judgments, even if—and this often occurs—we are not actually compelled to admit that our unfavorable opinions of others are reflections of our own character. A man who always imputes dishonorable motives to others is almost invariably capable of dishonorable acts, even when he is not actually guilty of them. A person who is forever looking for evil attributes in others is in sore need of a moral house cleaning.

Kind words and acts not only produce happiness—for ourselves as well as for others—but, as we soon discover, the habit of kindness is infectious. Our kindness, our sympathy, our helpfulness, are never wasted. Invariably they are returned—like the scriptural bread upon the waters—and often they are increased a hundredfold. In fact, it is the law that our kindness to others makes them kind to us, and as the very acts in themselves have already repaid us by adding incalculably to our happiness, the reward we gain in overcoming the tendency to be unkind is more than we could ever ask.—"The Globe Women Advertiser.'

A druggist can obtain an imitation of MINARD'S LINIMENT from a Toronto house at a very low price, and have it labeled his own product.

This greasy imitation is the poorest one we have yet seen of the many that every Tom, Dick, and Harry has tried to introduce.

Ask for MINARD'S and you will get it.

Some Hints on the Care of the Fingernails.

Finger-nail gnawing should be a punishable offence. Only a term in prison can sufficiently punish such a crime against society, for the appearance which nails so mistreated present is positively revolting. Yet many young girls who have contracted the practice of nail biting in childhood are not nearly so much to be blamed as are the persons responsible for their upbringing. The habits of a lifetime—no matter how brief may have been the span—are not easily broken, but the exercise of will power will certainly break one off the habit of biting at the nails.

"The finger-tip of the guawed nail usually becomes thick and square," but if rightly and regularly treated it may in time be made to taper. While a girl is reading or studying she may comfortably wear upon each one of the maltreated fingers little caps made specially for the purpose and so shaped as to compress the flesh about the nail into a tapering form. These caps may also be worn under the gloves used to protect the hands when out of doors or to bleach and soften them in the night, so that they really work while the wearer walks, or visits, or sleeps.

To Shape Them

As the nails which formerly have been gnawed begin to grow longer they must be handled carefull, as their texture is extremely delicate and easily broken or carcked. To shape them only the most pliable of files should be employed, and an emery board is even better, as any steel instrument is likely permanently to injure the tender nail. For the same reason the cuticle around the base of the nail should be kept from growing too rapidly by applying lemon juice. The cuticle should be pushed back a little each day, but not until the hands have first been thoroughly soaked in warm water and Castile soap and then

PEERLESS

VENO'S LIGHTNING COUGH CURE

Discouraged Woman!

A Woman Understands Your Case and Offers Relief, Free!!

There are thousands of women going along through life under a heavy physical burden; never entirely free from pain, never without those down-dragging symptoms which only a woman can fully understand; never without melancholy, depressed spirits that give rise to all sorts of forebodings and groundless fears.

Such sufferers often incur heavy doctor bills, yet it avails them nothing. Being still uncured, they do not know what it means to enjoy even one single day of health and happiness.

To all such, I want to say that I have been in precisely the same condition; caring little whether I lived or died, without hope for the future, a burden to myself and others. Because I know the joy and glad relief I experienced when I found permanent improvement through the use of the great "Orange Lily" discovery, I know how happy you will be at the quick improvement in your condition that will result from its use.

"Orange Lily" is a natural specific for our ills. It acts directly and powerfully upon the seat and centre of the trouble. Its healing, toning benefits are felt almost immediately even in the very worst cases. I am so positive of the good it will do you that I will send you ten days' treatment FREE, for the asking.

Don't Give Up!

Just write me to-day and get my free package. You'll be glad you did so, and I will be only too glad to help you. All correspondence held absolutely confidential. Address Mrs. Frances E. Currah, Windsor, Ont.

16

in olive or sweet oil heated to a temperature as hot as can be endured.

When the nails have been properly soaked and softened, an orange stick wrapped in old linen should be used to press back the cuticle, but very gently indeed, so that it shall not be torn and have to be clipped off or remain and necessarily form the painful and unsightly hangnail.

Nearly always finger-tips that have been the victims of the gnawing habit have a permanent and unsightly dark or black streak just under their upper edge. This is because lack of nail protection has permitted grime to accumulate there, and by some mischance this dust remained for long enough to allow a thin layer of cuticle to grow over it. This sort of thing may happen in the course of ten or twelve hours, and the streak is usually acquired during a long and dusty journey, when it has seemed scarcely worth while to wash the hands or to run an orange stick under the nails, as they were certain to get soiled again almost immediately, even though covered with gloves. The girl who has long, flexible nails, never has to contend with this difficulty, because the well grown, very thin nail naturally bends slightly inward at the top edge, and may be said to protect itself from grime.

While a girl is quite young, her hands are the least lovely of her physical attributes. The fingers of even the heiress to great welath, who has never put on her own shoes, are quite likely to be somewhat red and rough, while those of her sixty-year-old laundress, are white and soft—with age. But the finger-nails may always be made beautiful—and kept so—and the girl who does not cherish the ambition to have hers in that condition certainly lacks the sense of refinement which is an attribute of the thoroughly well-bred feminine person.—Daily Dispatch.

Well Brushed Clothes.

It is as necessary that daintiness should breathe forth from the clothes as that it should shine from the person. A woman may take care of her hair, her skin, her hands, and yet her clothes be sadly in need of airing or brushing or mending.

One's clothes should always be well aired after wearing, and in addition, sachet pads in drawers, wardrobes and cupboards will add a delicate, elusive fragrance that is a decided charm.

Clothes and hats should always be well brushes or dusted. A man rarely goes out without brushing his clothes; it is one of the cardinal principles of dress with a man. If a brush isn't handy a man will rub his hat with his coat sleev. But how often does a woman brush her hat, her coat, her dress? Yet dust is no respecter of persons. It will settle on a woman's clothes as quickly as on a man's.—Selected.

Adjust Height of Tables, Etc., in the Home.

A woman, 4 feet 10 inches in height, will find 32½ inches a satisfactory working surface height for kitchen tables, etc. Above this, an addition of half an inch in table height for each inch of increase in human stature will usually be about right.

Low sinks, tables, ironing boards, etc., are responsible for many tired, aching backs. By a little thought in purchasing, these pieces of furniture may be of such a height that an upright position may be maintained while the housekeeper is working at them. In any case, it is well by some means to adapt all kitchen furniture to the height of the user.

The Woman In Halifax Who Didn't

A little incident about "Beaver" Flour

MRS—(well, never mind her name) couldn't make good Pies with "Beaver" Flour. The crust was "always heavy", as she told her grocer.

He couldn't understand it, because he was selling "Beaver" Flour to all his customers. In fact, none of his customers would use western wheat flour after trying "Beaver" Flour.

The grocer asked Mrs.—how she made the pies. The recipe seemed all right until she came to the water.

"What kind of water do you use?"

"Why, WARM water, of course", exclaimed the poor young bride.

"Well, just try COLD water, ICED WATER, and you'll have the kind of Pies you read about."

"Beaver" Flour is a better pastry flour than even special pastry flours; because it contains the same choice Ontario wheat from which special pastry flours are made. In addition, it also has a little Manitoba wheat to increase its strength.

This means, more Cake and Pies and Pastry to the barrel, while retaining its whiteness, lightness and home-made flavor.

Being blended in exact proportions, it is always uniform in strength and quality—and you can depend on it to give you the best results every time.

Order a bag at your grocer's and try it when next you bake.

HALF THE ILLS OF LIFE

Are Caused By CONSTIPATION.

When the bowels become constipated the stomach gets out of order, the liver does not work properly, and then follows the violent sick headaches, the sourness of the stomach, belching of wind, heartburn, water brash, biliousness, and a general feeling that you do not care to do anything.

Keep your bowels regular by using Milburn's Laxa-Liver Pills. They will clear away all the effete matter which collects in the system and make you think that "life is worth living."

Mr. B. W. Watson, St. John, N.B., writes: "I have been troubled with constipation, for the last three years, and during that time have tried several remedies, all of which failed to help me. A friend recommended Milburn's Laxa-Liver Pills, and after using three or four vials, I felt like a new man. I am now still taking them, and am positively sure that I am on the road to recovery. I strongly recommend Milburn's Laxa-Liver Pills.

Milburn's Laxa-Liver Pills are 25c per vial, 5 vials for $1.00, at all drug stores or dealers, or will be mailed on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

A Militant Measure.

(Continued from Page 95)

Esther's desk was piled with gifts and flowers."

"And you, Mrs. Stilson, where are you going "

"Oh, we shall go to the country, of course. We love it, don't we, Lucy?"

Just then a telegram was handed her, and she added with a flush on her pretty face, handing the message to Lucy: "My husband comes for us tonight."

And so mother and daughter hurried home to do their packing, and await Arthur's coming. Esther's heart beat hard when the rap came, and she went to the door. There he was, grave, quiet, dignified and handsome. Esther had almost forgotten how strongly his personality had always appealed to her. He held out his arms and folded her to his heart, and not a question was asked or a word said. Lucy cried for very joy and hugged her father rapturously.

Then came the trip to the station, two hours later, and the ride home. How lovely the country was everywhere, how green and clean and inviting! There was a full moon, and the landscape mellowed into beauty, swimming in glory to these returned wanderers. Their man met them with the carriage, and they drove along the country road with expressions of joy at every turn in the road.

"Oh, smell the clover, how delicious!" cried Esther.

"And see the trees in the river, how lovely they are. Let us go by the river road," said Lucy.

So they made the drive as long as they could, and when they reached the outskirts of the Stilson farm Esther said: "It is like the Stilson farm Esther said: "It is like the sweep of a long avenue, Arthur, these trees you planted long ago. They will be more and more beautiful for many generations."

But she was thinking and wondering about the old stove and the horrid old kitchen, in spite of herself. She never could endure them again.

Finally they turned into the gate, and Esther gave a cry of delight. Lucy screamed for joy, and while the team stopped, she jumped out and ran ahead. There was a new house, a bungalow in style, artistic and beautiful, nestling among the trees! The old house had been moved back of the barn for the hired man, and the whole place had been metamorphosed!

On the doorstep of the new house were Dick and Joe, come to meet them. Aunt Mattie, smiling and happier than ever before in her life, was there too.

Esther and Lucy ran from room to room, exclaiming over this that and the other, upstairs and downstairs, and in my lady's chamber. Dick led them to the parlor and said: "You and Dad are to go to the city tomorrow to buy the new furnishings, so they will be just what you wish, little Mother.

"Now come to the kitchen. It is the most complete room of all—a modern one, with every convenienve; such a big shining range, a tiled floor, and a sink, and running water!"

"But how could you " exclaimed Esther.

"Oh, there is a windmill outside now, I am a magician!" said Dick.

"And are we to have fried chicken for supper," cried Lucy.

Arthur stood at the door of the dining room, watching them, with an expression on his face so full of love and pride that Esther went up to him with brimming eyes.

"Will you fogive me, Arthur, you dear, blessed man?"

"Can you forgive me, Esther Can you ever forgive my stubborn selfishness? You were right and I was wrong. If you had given me an easier liesson, perhaps I might never have learned so well."

Dick shouted: "Three cheers for the Stilsons," and taking Esther's arm, he led her to the dining room, where supper was served by Dinah, to one of the happiest families in the land.

Standardizing Canadian Eggs.

From present indications it would appear that one of the most important developments to date in the improvement of the Canadian Egg Trade was the action taken by the Canadian Produce Association last winter in adopting definite standards for Canadian Eggs.

Hitherto each market and in most markets each dealer had a system of grading peculiar to his own trade. This resulted in endless confusion to the consumer and great difficulty was experienced at times on the part of the producer in finding a satisfactory market for his product.

Realizing the importance of having definite standards for all live stock products, the Live Stock Branch of the Dominion Department of Agriculture has endeavored by means of pamphlets, placards, and other means to give the standards for eggs as much publicity as possible. The co-operation of exhibition associations has also been secured, prominent among which has been that of the Canadian National Exhibition Association at whose exhibition in Toronto this year in response to prizes offered, probably the largest collection of eggs ever brought together in one exhibition of the American continent was displayed. Some 7,000 dozen in all were on exhibition. The prize list for eggs was prepared in acocrdance with the standards and the judges made their awards according to the accuracy of the interpretation, on the part of the exhibitor, of the definitions of the various grades.

At a number of exhibitions where no extensive classes for eggs have been offered, the Live Stock Branch has made a display of eggs graded in accordance with the standards and in each instance has supplemented the display with actual demonstrations, in a candling booth specially designed for the purpose, of the way in which eggs of the various grades appear when candled.

In order that the consumers and producers generally may become more familiar with the various classes and grades the following explanation is given.

Three general classes for eggs are provided under the standards, viz:—

"Fresh gathered," "storage," and "Cracked and Dirties." Four grades are provided in the first class, three in the second, and two in the third.

The grades in the "Fresh Gathered" Class are "Specials," "Extras," "No. 1's" and "No. 2's." The grade "Specials" is omitted from the "Storage" class, and both specials and extras from the class for "Cracked and Dirties."

"Specials" according to the standards are eggs of uniform size weighing over 24 ounces to the dozen or over 45 pounds net to the 30 dozen case; absolutely clean, strong and sound in shell; air cell small, not over 3-16 of an inch in depth; white of egg firm and clear and yolk dimly visible; free from blood clots.

"Extras" are eggs of good size, weighing at least 23 ounces to the dozen or 43 pounds net to the 30 dozen case; clean, sound in shell; air cell less than ⅜ of an inch in depth; with white of egg firm, and yolk slightly visible.

"No. 1's" are eggs weighing at least 23 ounces to the dozen or 43 pounds net to the 30 dozen case; clean, sound in shell; air cell less than ½ inch in depth; white of egg reasonably firm;

GOOD DIGESTION

When your digestion is faulty, weakness and pain are certain and disease is invited.

Its flavor so pleases and satisfies that users are glad to tell others.

REMEMBER the Guarantee!

"You'll like the flavor"

yolk visible but mobile ,not stuck to the shell or seriously out of place.

"No 2's" are eggs clean sound in shell; may contain weak watery eggs, and eggs with heavy yolks, and all other eggs sound in shell and fit for food.

Consumers in order to protect themselves in the matter of purchasing eggs should acquaint themselves with these standards and the above definitions of the grades. Only by creating a demand for certain grades of eggs will the supply be forthcoming, and the demand can come only with a thorough knowledge on the part of the consumer as to what constitutes the various grades. It has also been frequently suggested that since the adoption of the standards consumers generally, in order to safeguard themselves, would do well to insist that all eggs as offered for sale be labelled in accordance with their proper grade.

Producers too, would do well to more systematically grade their eggs before marketing, and knowing definitely what they have in hand thereby be in a better position to demand a price commensurate with the quality supplied.

Ground vs. Whole Grain For Live Stock.

It is somewhat doubtful whether the grinding of corn for some classes of live stock is worth the labor and expense involved. Tests conducted for ten years at the Wisconsin Experiment Station showed an average increase in gains of about 6 per cent from grinding corn for hogs. The results for individual years ranged from 11 per cent loss to 18 per cent gain. The Iowa station has also done done considerable work in testing various methods of preparing corn for hogs, and found that while grinding showed a slight increase in the feeding value of corn for older hogs, such gains did not begin to pay the cost of shelling and grinding. Soaked shelled corn showed to much better advantage than the corn meal, and also proved somewhat better than the dry ear corn.

It was a question however, whether the difference in feeding value paid for the labor of shelling and soaking.

It is advisable to grind small, hard grains as kafir, milo, barley, rye, or sorghum seed, as otherwise a large proportion of the feed may not be digested.

Ground oats for horses have not shown any great advantage over whole oats, except in the case of horses that are at very hard work or have defective teeth. Grinding oats for hogs, however, will increase their feeding value from 20 per cent to 30 per cent since the hog is not able to digest the whole grain to advantage.

As much as 25 per cent of whole corn may remain undigested when fed to cattle. Unless hogs follow the cattle in the feed lot, it is therefore desirable to grind the corn to prevent this waste. Sheep will handle whole grain to much better advantage —Chas. I. Bray, Colorado Agricultural College, Fort Collins, Colorado.

Mulching Strawberries.

The object of mulching strawberries in the fall is to prevent winter-killing.

Winter-killing is usually caused by the plants dying out too much during the winter months, or by alternate freezing and thawing.

The best mulch material to use is clean straw; this is placed on the plants 4 to 6 inches deep after the ground has been frozen.

In the spring after the ground is thawed, the straw is worked around the plants. This serves several purposes, such as keeping the patch free from weeds, conserving the moisture, and forming a clean mat for the berries to ripen on.

After the fruit has ripened, the straw should be removed.—E. F. McKune, Colorado Agricultural College, Fort Collins, Colorado.

The Source of Speed

Note the STEEL LINING in these Speed Shells. An exclusive Remington-UMC feature—found only in

NITRO CLUB SHELLS

It's the source of their surpassing speed. The steel lining permits high powder-compression. This means quicker combustion and greater power. Puts ALL the power in a straight-line drive. Practically a gun within a gun. Result: Quick fire—shorter lead—greater accuracy—deeper penetration—more uniform pattern. You want more birds. Use SPEED SHELLS—and get them!

"Successful Sport"

Another name for Speed Shells in a Remington-UMC Pump Gun. A combination favored by experts and sportsmen throughout the world. Let your Dealer show you the *latest* in World-Standard Arms and Ammunition.

When the Back Becomes Lame

IT IS A SIGN OF KIDNEY TROUBLE

Doan's Kidney Pills cure the aching back by curing the aching kidneys beneath—for it is really the kidneys aching and not the back.

Doan's Kidney Pills are a special kidney and bladder medicine for the cure of all kidney troubles.

Mrs. Louisa Gonshaw, 683 Manning Ave., Toronto, Ont., writes: "I take great pleasure in writing you, stating the benefit I have received by using Doan's Kidney Pills. About three years ago I was terribly afflicted with lame back, and was so bad I could not even sweep the floor. I was advised to try your pills, and before I had used one box there was a great improvement, and my back was much better. However, I kept on taking them until my back was completely cured. I highly recommend 'Doan's' for lame back."

Doan's Kidney Pills are the original pill for the kidneys. See that our trade mark the "Maple Leaf" appears on the wrapper.

Doan's Kidney Pills are 50c per box, 3 boxes for $1.25; at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

SYNOPSIS OF CANADIAN NORTH-WEST LAND REGULATIONS.

THE sole head of a family, or any male over 18 years old, may homestead a quarter-section of available Dominion Land in Manitoba, Saskatchewan or Alberta. Applicant must appear in person at the Dominion Lands Agency or Sub-Agency for the District Entry by proxy may be made at any Dominion Lands Agency (but not Sub-Agency), on certain conditions.

Duties—Six months residence upon and cultivation of the land in each of three years. A homesteader may live within nine miles of his homestead on a farm of at least 80 acres, on certain conditions A habitable house is required except where residence is performed in the vicinity.

In certain districts a homesteader in good standing may pre-empt a quarter-section alongside his homestead. Price $3. 0 per acre.

Duties—Six months residence in each of three years after earning homestead patent; also 50 acres extra cultivation. Pre-emption patent may be obtained as soon as homestead patent on certain conditions.

A settler who has exhausted his homestead right may take a purchased homestead in certain districts. Price $3.00 per acre. Duties—Must reside six months in each of three years, cultivate 50 acres and erect a house worth $300.

The area of cultivation is subject to reduction in case of rough, scrubby or stoney land. Live stock may be substituted for cultivation under certain conditions. W. W. COREY, C. M. G.

Deputy of the Minister of the Interior.

Feeding the Dairy Cow for Best Profits.

(Continued from page 85.)

chine. If the supply of carbohydrates and fat is insufficient for this purpose, protein may also be drawn upon as a source of fuel, but since use of protein is expensive, since the latter is the most costly of the nutrients. On the other hand, if more carbohydrates and fat are supplied than are necessary to meet the needs of the animal, the surplus may be stored up as reserve fuel in the form of fat. The unit of measure for the energy or heat-producing power of a feed is the therm, i.e., the amount of heat required to raise the temperature of 1000 pounds of water 4 degrees.

Available Energy, Net Energy.

The amount of heat evolved in burning a food substance does not necessarily measure its nutritive value to the animal since from the total fuel value of the feed the following losses must be deducted in order to determine the available energy:

1. Undigested food in the alimentary canal.

2. Gases due to fermentation in the paunch and intestines.

3. Urea, a nitrogenous compound which escapes through the kidneys.

From the available energy we must deduct a certain amount which is used up in the work of mastication, digestion and assimilation, in order to secure the net energy which the animal may use for the work of the heart, lungs and other internal organs, and in case any repairs after the maintenance requirement of the animal is met, it may be used in the production of milk. When 100 pounds of peanut oil is burned it yields 399 therms of energy. When fed, none of this oil passes into the feces or solid excrement as waste, all being absorbed by the small intestine and going into the body proper. No fermentation takes place and since there is no nitrogen present there is no nitrogenous waste in the urine. To digest and assimilate this 100 pounds of oil required 174 therms of energy, leaving 224, which might be stored in the body for the use of the tissues.

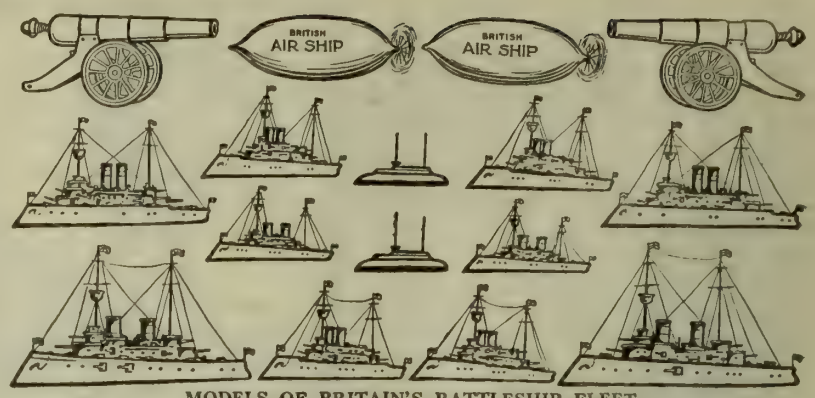
When 100 pounds of wheat gluten, which is practically pure protein, is burned, it gives off 263 therms of energy. No part passes away in the solid droppings, or in gases, but a large amount is carried away by the urine, this loss coming from the breaking down of protein nutrients within the body. This fact also explains why it is unprofitable to feed animals an excessive amoutn of protein. The excess nitrogen simply passes off with the urine and the animal gets no benefit therefrom. In all 167 out of 263 therms, in gluten are lost, leaving 95 therms, which may be used temporarily or stored in the body.

With 100 pounds pure starch we find that there is no loss in the feces nor urine, but that a considerable amount is lost by fermentation, the gas thus formed (methane gas and carbon dioxide) escaping from the body without being used for fuel. The total loss is 87, leaving 98 therms for the use of the body.

While the total fuel value of corn, timothy and wheat straw is not greatly different, yet a much larger portion of the energy in the roughage escapes with the excreta, so that a comparatively small amount is left for the use of the animal body. In terms of per cent we find that only 9% of the value of corn meal passes away with the excrement, while with wheat straw 54% of the fuel value is excreted, the total loss ranging from 58% with corn to 94% with wheat straw. The net energy that the animal can use is 41% with corn and only 6% with wheat straw. This explains why milk cows do not fatten up and at the same time give an abundant supply of milk when wintered upon straw; 100 pounds of wheat straw contains 10 therms of energy. A 1000-pound cow requires for maintenance and for 20 pounds of 4% milk 12 therms of energy. It is thus evident that the cow would have to consume over 100 pounds wheat straw per day in order to maintain her body and have sufficient energy left to produce 20 pounds of milk.

There are several objects to which the cow may devote her food: Maintenance, milk production, growth of fetus and gain in weight. Since the animal machine cannot be stopped, even when it is not in active use, it follows that a certain amount of food is constantly required simply to make good the wear and tear of the body. This is called the maintenance requirement. When a cow giving an average amount of milk, the maintenance requirement calls for about half the food value. Moreover, maintenance is an arbitrary requirement and cannot be decreased.

If insufficient food is supplied, the cow must use as much for her maintenance as when she was receiving a full ration and thus the decrease comes entirely on the portion that would ordinarily be devoted to milk production. When the dairyman has gone to the expense of supplying the



MODELS OF BRITAIN'S BATTLESHIP FLEET

GIVEN FREE TO BOYS

BOYS—Just think of owning twelve (12) beautiful models of the fine ships of the British Navy—two great Super Dreadnoughts, two Dreadnought Battle Cruisers, four Destroyers, two Torpedo Boats, and two Submarines—a veritable battle fleet. Just look at them. With them you get two dandy breach loading, trigger firing cannons that actually fire ammunition—peas, beans, or anything else you put into them, and two toy airships. You'll just get a barrel of amusement out of these fine ships, and they will surprise and interest all your friends wherever you show them. We have brought them for you all the way from Japan, where they are made by the clever Japanese. All the boats are fully rigged and painted in full colors. You'll agree that they're the finest models you've ever seen, and you'll soon devise all kinds of great games with them.

Just write to us to-day, boys, and get, postage paid, a free sample of **"Fairy Berries,"** the delightful new Cream Candy Coated Breath Perfume, together with just **25** big handsome packages to introduce among your friends at 10c. each. Open your sample package and ask all your friends to try a "Fairy Berry." They'll be so delighted with them that everyone will buy a package or two at once. No trouble at all to sell delicious "Fairy Berries." Everybody just loves them.

Return our money, only $2.50, when the breathlets are sold and you'll promptly receive the complete set of twelve model battleships, two cannons and two airships, exactly as represented. We pay all delivery charges. Hustle, boys. Don't miss this great opportunity. Address

maintenance requirement it is poor economy to withhold the other half of the feed that would be used for the production of milk. The function of maternity, however, is so strongly developed in the cow that she will continue to give some milk, even when the food supply is insufficient. The material for the milk thus formed is taken directly from the animal's body with a consequent emaciated condition of the animal.

In fact, the weight of the animal forms a very fair index as to the relation between food supply and milk production. The amount of milk a cow gives is usually in direct proportion to the amount of food she consumes over and above the maintenance requirement up to her limit to produce milk. If she eats more than this she gains in weight, storing up the excess in the form of fat, to be given off again when the food supply is insufficient. If she eats less, she either robs her body or decreases in milk flow.

Clover hay contains more than 2½ times as much protein as timothy hay and also more energy than timothy. In spite of its low feeding value, timothy hay is high in market price on account of the demand for it as a horse feed. This combination of low feeding value and high market price makes timothy hay a very expensive roughage. At the usual market prices timothy hay charges the feeder the enormous price of $45 for 100 pounds digestible protein, while clover hay furnishes a like amount of protein for only $14.80. Similarly, timothy charges $2.73 for 100 therms of energy, but clover only $2.29. Corn stover may be substituted for timothy hay to advantage since the stover is nearly equal in feeding value to timothy hay and at $8 per ton furnishes nutrients at a much lower cost than does timothy hay at $18. Corn silage, besides being a succulent, palatable feed, is at the same time an economical roughage, since it furnishes energy at the very low price of $1.18 per 100 therms.

When timothy hay alone forms the roughage, the cow will need about 20 pounds of it. In addition she must have two pounds of corn meal, two pounds ground oats, two pounds wheat bran and two pounds oil meal. This ration will cost about 31.7 cents. The man who has mixed hay can dispense with one pound oil meal and his ration will cost 28.8. With clover hay as roughage another pound of oil meal can be left out and we get a ration for 25.9 cents. With 30 pounds corn silage and eight pounds clover hay forming the roughage, there is needed to complete the ration two pounds corn meal, two pounds ground oats, two pounds wheat bran and one pound oil meal. We now have a ration that costs but 24.2. The dairyman who uses this ration will save in cost as compared with the first 7½c per cow per day. In a 40-cow dairy this would amount to $90 per month, and to $540 during the six months winter feeding season. This difference is brought about entirely by the character of the roughage. With the timothy hay ration the cost of feed is almost as great as the average price of butter throughout the year. The roughage, in fact, is the most expensive part of the ration. It is evident that when timothy hay forms the roughage there is only a narrow margin between the cost of feed and the market price of butter produced. Silage and clover hay, on the other hand are not only the less expensive roughage in themselves but do not demand so much grain nor so expensive a grain ration to complete the ration as does timothy hay.

We have found that corn silage and clover hay form a palatable, nutritious and economical roughage. A grain mixture made up of 200 pounds hominy or corn meal, 200 pounds cottonseed meal, 100-pounds distillers' dried grains and 100 pounds wheat bran is high in feeding value, low in the cost of protein and energy and contains sufficient variety to be fairly palatable. This mixture will serve to illustrate how a combination of economical roughage and an economical grain mixture will still further lower the feed bill. Let us make up a proper ration for a 1000lb cow giving 20 pounds of 4% milk, and for the sake of the dairyman who does not have clover hay, we will use mixed hay instead.

A Daily Ration

30 lbs. corn silage	$0.060
10 lbs. mixed hay	.085
2½ lbs. grain mixture	.072
Total	$0.217

This is 10 cents less per day than the timothy hay ration and would mean a saving for six months' feeding in the 40-cow dairy of over $700. The greatest efficiency at the least cost should be the aim. Proper feeding is desirable, but kindness and good care are just as essential to large milk yields. Furthermore, good cows are just as essential as are proper rations. Neither can give the best returns without the other.

What a shame and a disgrace it is to feed good hay, silage and grain to a scrub cow that will not repay the market price of the feed given her. Good cows, good feed and a good dairyman are a winning combination but "the greatest of these" is a good dairyman. No matter how well balanced the ration may be, it is of little value unless fed by a well-balanced dairyman.

Many cows are now kept at a loss that would transfer their balance to the credit side of the ledger if they could simply exchange owners. Good judgment must be exercised in the selection of feeds that will maintain the health of animals, provide a palatable table, nutritious and economical ration and produce a liberal flow of milk.—New England Homstead.

If there's one thing more than another that's a necessity to the housewife, it's a good range!

She'll get along without other conveniences, but give her a satisfactory, good-baking range.

In the "Kootenay" range nothing is omitted that makes for comfort and convenience, for durability, economy and efficiency.

McClary's Kootenay Range

There's a good reason for our using "Armco" rust-resisting iron for its body, and Semi-Steel for the firebox linings; a good reason for its burnished smooth top, its nickelled steel washable oven, its double duplex grates, patented detachable reservoir, its scientifically planned firebox and flue system.

These and other patented features of the "Kootenay" are fully described and pictured in the dainty recipe booklet. Do not hesitate to write for this booklet.

By doing so you can study and know every detail of the Range before personally examining it at your merchant's store. You will then be able to more intelligently discuss the range and understand its many good points.

The booklet is free. Write to-day.

Pig Notes.

Many persons seem to think that pigs cannot be over-fed, and that it makes no difference if they do leave a lot of food at one meal—they will come back and eat it when they are hungry, so that nothing is wasted after all. But it is easily possible to go to either extreme—to feed too little, so as not to secure a steady gain, or to feed too much, and so increase the cost as to lessen the profits. Feeding an economical plan, is to feed regu while fattening, all they will eat up clean. They will keep healthier, and thrive better, than is possible by keeping food before them all the time. It is what the animal digests, and not what he eats, that determines the gain in proportion to the amount of food supplied. Food left over is, to say the least, distasteful to a pig, while if food is soaked too long before feeding, it will become so sour as to be unpalatable; it should, however, be slightly sour, but any excess in this direction is not to be recommended. The pig ,when growing or fattening, most benefit from it, and he will hardly do this if he eats what he wants, obliged to come back and finish it up. This is not economical, and, when the margin of profit is small, the waste of feeding in this way will greatly lessen, if not entirely cut off, the possible profit. It is an important item in management at all times to feed stock well, and fattening stock should have all that they will eat clean, and be supplied with a variety of foods, in order to secure as good a growth as possible.

Killing and Curing

A pig that is to be kiled should be kept without food for twelve or sixteen hours. Every effort should be made to get every drop of blood out of the body, otherwise the carcase will not cure so well. The pig is next immersed in nearly boiling water. The temperature of the water is very important. If it is either too hot or too cold the hair will not come off freely. A good old-fashioned plan is to try the temperature by letting a few drops of the pig's blood fall into the water—if it spreads over the surface the temperature is right. Leave the pig in the water until the hair comes off freely. Pigs are not easily lifted out of the water, especially when hot, and it is a good plan to erect a block overhead so as to facilitate the operation. The pig should now be vigorously scraped with a blunt instrument, and there is nothing better for the purpose than the lid of an old tea kettle. When the hair is all removed the skin should be well dried. The inside is then removed in the usual way, and the inside wiped with a clean cloth. The pig should then be allowed to hang in a clean, airy place for twenty-four hours. It is then cut up into hams, hands, spare-ribs, loins and belly pieces. The spare ribs and loins are generally used for roasting fresh. The other portions are rubbed over with coarse salt and a little saltpetre, and laid on a table, flesh uppermost, so as to drain off any blood. The system of dry salting is to be recommended, as by this system the bacon is so so flabby as when steeped in dry process, equal quantities of salt and brown sugar are used, with ¼ oz. saltpetre to each pound of the mixture. This is thoroughly rubbed into the pork every second day, and the position of the meat changed at each rubbing, that is, the top portions put at the bottom, and vice versa. The time required for finishing the bacon will depend upon the size of the pig and the state of the weather. The salt goes into the meat more quickly in wet than in dry weather. The place for curing should be cool, with a free circulation of air. From three to four weeks will be required for the curing of a good sized pig.

Fall Cleaning of the Truck Garden

In the control and prevention of plant diseases sanitation of the garden is important. There are a number of our fungus diseases which rest over the winter on or in decayed stalks, leaves, or fruit. The resting stage of the fungus is resistant to winter conditions. Among such diseases which rest over in the above manner are:

Club root cabbage, onion mildew, leaf spot of strawberry, leaf spot of beets, early blight of celery, late blight of celery, and asparagus rust.

If a disease is not destructive one season, it is no sign it will not be another season. Rake up and burn the old stalks, leaves and fruit left in the garden patch.—W. W. Robbins, Colorado Agricultural College, Fort Collins, Colorado.

Using Sulphur as a Disinfectant.

When preparing a building for fumigation with sulphur move the animals out of it, and also such metal goods as are movable, but it is a great mistake, although a common one, to sweep and clean down the building before fumigation, as this tends to the spread of both vermin and disease germs, by stirring them up and distributing them about, before being subjected to the fumes or poisonous gas. The windows and ventilators should be carefully closed and stopped up, so that fresh air, which would dilute the gas, is not admitted. The contained air in the building is usually sufficient to secure complete combustion of the sulphur. There are several ways of burning the sulphur. One is to place a large tray or bath in the centre of the building with a few inches of water in it, and stand it on a couple of bricks, an old iron saucepan or small zinc bucket. Break up roll sulphur into tolerably fine pieces, and drop a few lighted matches or some red hot coals on to it, and when it is seen to be well alight, leave the building quickly, and lock the door—personally retaining the key. Another plan is to set up a brazier of charcoal or a tinker's fireplace, and place the broken roll sulphur over the fire on a stout seet-iron tray. In the case of large buildings it is well to have several centres of combustion, dividing the sulphur into two or three parts, and burning them simultaneously. The quantity of sulphur recommended to be used is 1 lb. of roll brimstone for every 1,000 cubic feet of air space. The way to calculate this is to multiply the length of the building by the breadth, and the result by the height, in feet, and divide by 1,000. Before

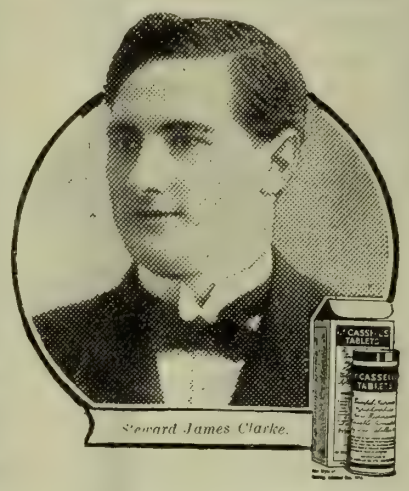
Saved from the Lusitania

Steward Who was Picked Up Unconscious describes his experience.

So Nerve Shattered His Friends Hardly Knew Him.

Now, Restored to Vital Strength by Dr. Cassell's Tablets, He Sends Letter of Thanks and Praise.

Mr. James Clarke, of 12, Kew-road, Birkdale, Southport, Eng., a Steward of the Lusitania, was attending to his duties below deck when the German torpedo found its mark, and in sixteen minutes sent the superb vessel to the bottom. Then began his terrible struggle for life. With many others he managed to catch hold of a drifting box and cling to it. Hour succeeded hour, and one by one as their strength failed his companions were carried away on the surge of the sea. At length only he and one other remained, then he alone. After that unconsciousness. The last thing Mr. Clarke remembers is a vision of smoke on the far horizon. As it proved this was the smoke of a rescuing vessel, which picked him up just in time.



Steward James Clarke.

It will easily be understood that such an experience must shatter the strongest nerves; and so it was with Mr. Clarke. But on recommendation he took a course of Dr. Cassell's Tablets, and now he sends us a personal letter in praise of that great remedy. He says:—

"Dear Sirs,—Just a few lines to thank you for the grand benefit I have received from Dr. Cassell's Tablets.

"I was on the Lusitania when she was torpedoed on May 7. After floating about on a box for four and a half hours I was picked up in an unconscious state by a rescue-vessel and taken into hospital.

"You will quite understand that my nerves were in a dreadful state after the terrible shock. My appearance was so changed that friends who came to meet me on my arrival at Birkdale did not know me.

"To cut a long story short, Dr. Cassell's Tablets have worked wonders in my case, and I am now feeling fit and well. You can publish this letter along with my photograph if you care to do so, for Dr. Cassell's Tablets are really an excellent nerve tonic.

(Signed) "James Clarke."

Dr. Cassell's Tablets

SEND FOR A FREE BOX.

starting the sulphur burning, have some paste and strips of paper, and, when outside, paste up cracks in the door, and around window frames that are ill-fitting. The great thing is thoroughly to saturate the atmosphere contained in the building with the sulphurous fumes, and to keep the place shut up for some hours. Eight hours is the period recommended by sanitary experts, but in the fumigation of stables and agricultural buildings it is generally the best plan to start the fumigation in the late afternoon, and leave the sulphur to burn out, and the building to remain hermetically sealed until next morning. Needless to say that, as gaseous disinfectants destroy parasites and bacteria, and their presence in any quantity is incompatible with the existence of human or other animal life, the building must afterwards be thoroughly ventilated. The best plan is to throw open the door, quickly open the windows, and unstop the ventilators, and leave the place until the air is quite clear.

Keeping coal slack and salt in front of the hogs even when they are on good pasture is advisable. Care should be taken when these ingredients are first fed, as the hogs not infrequently eat larger quantities than are beneficial. Some cases of loss as a result of over-eating salt and impaction of cinders are reported. Death usually follows before the animals are discovered to be sick. Ordinarily, however, there is no danger in feeding salt and coal at will, once the hogs become accustomed to them.

Growing the Potato Crop.

(Continued from Page 77)

two hours, then dried, and cut for seed. As the spores live in the ground for several years the treated seed should be planted on land that has not produced scabby potatoes for several years.

Digging

If potatoes are not diseased they should be dug as soon as the tops die down, while if they have been killed by blight they should be left in the ground as long as possible before digging.

For large growers the potato digger is a necessity but where small fields only are grown the potato hoe or fork are used for digging.

Storing

Each farmer must decide for himself whether under his particular conditions it will pay best to market the potatoes at the time of digging or to store them. Storing should be done in a cool, dry, well ventilated cellar which is perfectly dark.

Idle Stallions Not Profitable.

Idle stallions are usually not very profitable. This is the conclusion one is sure to draw from a knowledge of the stallion business. There is too much work in caring for the idle stallion and too little income from him Frequently he is not very sure as a breeder. Except in the breeding season he is usually neglected to such an extent that unsoundness develops or bad habits are formed.

Work is the remedy. Farmers who own stallions have been the first to put this principle into practice. Without precedent for working draft stallions in this country they were slow to undertake it. Yet it is unseemly for an enterprising farmer with much need work to be done to have a big, strong horse idling away his time day after day.

It has usually been found that stallions are the very best of workers. They are strong, quick, alert and courageous. The work keeps them in fine physical trim. It occupies their minds and steadies the nerves so they are more readily controlled and cared for. When a stallion is working he gets good care as a matter of course, and that is what he needs. There is no extra expense about it and no hours wasted leading him along the road for aimless exercise. The working stallion is so cheaply kept, so easily handled and so sure as a breeder, that farmer who is fairly successful with horses can conveniently keep a sire. This fact is resulting in a gradual transfer of the stallion business from the professional owner to the farmer. It tends to encourage the keeping of a larger number of stallions for breeding purposes.

Treating Wire Cuts on Horses.

Don't apply axle grease or similar ointment to a barb wire wound on a horse. First wash the wound with warm water, clip the hair closely around it and then wash again. Never use a sponge to clean out foreign material lodged in a deep cut, but use a piece of absorbent cotton or cotton-batting. This is not so likely to cause infection. It is useless to put stitches in a deep or ragged wound or one that is located in a place not in rest while the animal is moving. A dry dusting powder consisting of equal parts of slaked lime, sulphur and charcoal has a healing effect on wire wounds and similar cuts.

The danger from nail wounds or other punctured wounds is lockjaw. Open up such a wound freely so that the pus drains out and saturate with a solution of corrosive sublimate and water in proportion of one to 500. Cover with dusting powder, absorbent cotton and a bandage and repeat the treatment daily.—Dr. A. S. Alexander, Wisconsin Agricultural College.

THERE'S a smart fit and superior appearance about Penmans Sweater Coats that stamp them as distinctively better than others.

They give warmth, comfort and freedom of movement, without sacrificing "class" and style.

They are permanently shape-retaining; give long service and lasting satisfaction. All styles and colors at all good stores.

Springbrook Ayrshires !

At our recent sale we sold many valuable cows, bulls and young stock. We still have on hand some of the best cows, heifers and young bulls in Eastern Canada, and with these we purpose to remain in the Ayrshire breeding business and again build up our herd to its former numbers. Meet us at the fairs this fall.

Our present offering includes:—1 bull 20 months old, 1 bull 8 months old, several females, all ages and some grand high grade cows fresh in milk.

McIntyre Bros.,
Sussex, N. B.

Maple Green Farm Holsteins

To avoid inbreeding, we now offer for sale our senior herd bull "Maple Grove Mercena Mercedes," coming 5 years old; weight about 2500 lbs., active, sure and exceptionally kind. His first daughter to be officially tested made 15.46 lbs. butter in 7 days at 1 year and 11 mos.; another at 2 years and 2 mos. was making nearly 3 lbs butter per day when she met with an accident and we had to drop testing her. His dam gave 12664 lbs. milk and 568 lbs. butter at 2 yrs. old in the R.O.P., and her sister Posch Mercedes Springbank 2nd, is the Canadian Champion 4 yr. old in the R.O.P. with 22000 lbs. milk and over 800 lbs. butter in the year. We are also offering Bull and Heifer Calves sired by him and "King Lyons Colantha" and out of high-class Record of Merit and Record of Performance Dams.

For further particulars write

Importance of Veterinary Instruction.

Veterinary science, in common with other branches of education and instruction, is rapidly advancing in recognition, exactness and unsefulness. For many long years it was neglected and ignored, both in the new and old lands. Approaching the middle of the last century there came an awakening and in England royal patronage was extended and the Royal College of Veterinary Surgeons was established, or rather came into existence by consolidation, for from 1791, there had existed schools in which the health and mending of animals received attention. It was the consort of good Queen Victoria, Prince Albert of Saxe-Cobourg Gotha, who of royalty first manifested an interest in veterinary science in the motherland, and rendered immense service in helping to remove the seeming reproach and stigma conveyed in the phrase once often heard: "He is only a horse doctor." In the year mentioned, that is in 1791, the English veterinary college, still doing its good work, was established in Camden Town, London. In 1865 the Albert Veterinary College, named in memory of the late Prince who died four years previously, was opened and then came the Royal College of Veterinary Surgeons, and today the much cherished, valued and rare title of Fellow of the Royal College of Veterinary Surgeons. In passing it might be suggested that "veterinary doctors" or "physicians" would be more appropriate and indicative, for bone-mending or curing by incision, forms but a small part of the duties the modern animal doctor is called upon to perform, even though bone-setters of the lower creation have proved of exceeding usefulness in practicing their swill upon the higher order.

A long time prior to the establishment of the Albert Veterinary College, the College at Edinburgh had been fulfilling its noble mission, and it was from that institution tha veterinarism in Canada received its early seed. It was from there came the late Dr. Andrew Smith, founder fifty-three years ago of the Ontario Veterinary College. That was the beginning of recognized veterinary instruction in this country. The first class was very small, only three young men having the spirit and intelligence at the time to recognize that the doctoring of animals was not a haphazard, but an applied and practical science. From that time the growth of that recognition has been gradual, but it is to the credit of Canada that it has been more insistent and vigorous than in older lands. Almost from the first the provincial government of Ontario displayed helpful interest and thus materially aided in the development of the struggling but inestimably useful and valuable institution on Temperance Street, Toronto, where the early foundations were laid and which grew in time to inhabit a building of size and importance. In Quebec, too, the advance in veterinary knowledge has been equally significant, but of later origin. When, however, some energetic, learned men did come to the front in the eighteen eighties progress speedily followed until today French Canadian students have at their disposal in connection with Laval University facilities on a par with those that their fellows of English extraction are privileged to posses in Ontario. In the time to come it is not difficult to believe that elementary veterinary education will receive much wider attention and occupy at least a minor place in rural schools.

Of the importance of veterinary science, of the health of live stock that contribute, in rivalry with the instant productions of the soil, to the welfare of humanity there can be no over-estimation. There is perhaps no greater vehicle for the conveyance of the disease germ under neglect than the domestic animal—the creature of one kind that we pet and another that we devour. We caress and hug the dog and cat, we associate with and utilize the horse, and we eat cattle, sheep and swine. They all in their way, if understood and well-cared for, afford health and comfort. If neglected, the life they yield and are intended to yield to mankind, they confer with equal ease upon pests that deal widespread destruction—that disseminate ills of a numerous, various and complex nature, and of an order that is more deadly and universal even than war. It is to cure, check or suppress this tremendous evil begotten of a blessing vastly beyond estimating that is the object and aim of veterinary science that the governments of Canada, both federal and provincial, are bending their energies to combat, and that means much, perhaps more, to the well-being of the nation as any branch of sanitation, yes, and as any branch of production.

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer::—

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16.114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

LEA & CLARK, Victoria, P. E. I.

Soil Sense--Suggestions on Soil Treatment

Preparing the Seed Bed

The problems of the soil are the most important problems of the nation. Their successful solution means food, clothing, and the necessities of existence for the people. They call for knowledge and training as great as the problems of business and science, in fact, farming is today both a business and a science to which the best minds of the country are devoting their attention.

Modern systems and methods have contributed and will contribute wonderful things to the farmer, but the farmer who makes the best of these newer aids must not lose sight of the older principles that common sense and experience have taught him.

Digging for the Truth

For the man who is a thinker there is no better way to learn about soils and crops than to get out in the field and dig for the truth.

Some day in midsummer go out in the thriving field and take your shovel with you. Pick out a vigorous hill of potatoes and dig down in the earth beside it. Perhaps you can use your hands a little too to scoop the dirt away and lay bare the roots that you know are the life of the plant above.

Do your work carefully and think as you go for there before you lie the big facts that are the key to all successful farming. The ground is fairly alive with the tangle of lacy roots reaching for many inches in every direction. The root system of a plant is one of the most intricate and wonderful things on the farm, yet how many farmers ever take the trouble to unearth it and study it at first hand.

You need not be a scientist to know that it is these roots reaching out through the soil that enable the plant to live; you need not understand the complicated chemical changes that occur in the plant. The thing you are interested in is that through these millions of roots the plant absorbs plant food, taking out of the soil elements it requires for growth.

You know, too, that before the plant can take up these elements they must be dissolved in water, hence the need for plenty of moisture in the soil.

These two common sense lessons that you have learned in the field are the basis of all that is known of plants and soil culture. Reasoning from them you can make your own rules and theories regarding the proper treatment of soils and cultivation of plants.

How Roots Grow.

Go back in your mind a few months ago to the time when the potato sets were first planted. Perhaps you have seen seed corn sprout in a saucer with a moistened cloth over it, and you know that it sprouts in the same way when it begins to grow in the ground. The first sprouts are soft and tender—anything but strong, yet they are the beginning of that tangle of roots that you see issuing in all directions from the grown plant. Those tendrils that are broken by even the touch of your finger must push their way through the soil in and around the particles, continually extending themselves, getting into new feeding grounds and sending up food to the plant. The roots must strike downward, too, because the surface soil dries out quickly in summer weather and the roots soon die. The deeper down the roots go the nearer they get to the moisture in the subsoil, and the better they withstand the drouth. What then must be the condition of the soil in order to give these roots a chance to do their work?

Childish question, you will say, perhaps! Yet, how many of us know the answer are guided by it when we are actually in the hurry of preparing the soil for seed?

Certainly roots cannot grow at their best unless the soil particles are pulverized, crushed and made as fine as possible throughout the whole surface as far as those roots grow.

Suppose the soil is left in lumps and clods. What happens to the growing roots? They cannot go through the lumps, but must grow around them, and waste energy and time doing work that does not help but hinders the plant, and stunts its growth.

A noted farm authority writing for Wallace's Farmer says:

"A clod contributes nothing to plant growth so long as it remains a clod, for the simple reason that plant roots can not penetrate it. These clods allow too free access of air, and the land dries out. Hence the man who allows his land to get cloddy through bad cultivation invites a crop failure, which will not wait for a second invitation."

No good healthy root system can be established in a field that is not finely pulverized to a considerable depth, depending somewhat on the soil conditions and the nature of the crop to be planted.

Roots need fine soil in order that they may fine their way through it easily, but that is not the only reason. Going back again to our common sense line of reasoning, roots get plant food from soil and in order to get this food they must come in contact with the soil. As a matter of fact the scientist would tell us that each particle of soil is coated with water, and in this so-called soil water the plant foods are dissolved. The more of these particles of soil that there are touching the root the greater quantity of this soil water the plant can take up. If lumps are coarse the roots cannot come in contact with so many of them, and will not be so closely surrounded by the soil particles.

In coarse and lumpy ground, perhaps half the length of the root will be wasted so far as feeding the plant is concerned. The root winds it way in the big air spaces between the clods.

Roots grow better in fine soil and they also help to make the soil finer. All plant roots have a certain chemical action on the soil, tending to break it into finer particles and to make it mellow.

A well known farm paper editor suggests an experiment made by taking two common glas tumblers, placing three kernels of corn in each and in one a handful of finely pulverized soil, in the other a soil full of lumps.

If these tumblers are then placed out doors where they can receive the rain and sunshine the difference will be quickly seen between the fine seed bed in which the roots are closely surrounded by soil and the coarse seed bed where the roots are getting no plant food.

If you could look through a pane of glass and see things working underneath the surface in your field, you would notice these conditions and you would know at once how to remedy the trouble. First you would make the soil finer, then to bring it in still closer around the roots you would press and pack it firmly, thus getting the roots and soil closely together.

Your observations in the field have taught you these two things; that soil should be finely pulverized, and that it must be firmly packed and pressed together. There is no question but that farmers realize this. The difficulty is that they do not believe the work can be done in a reasonable length of time, and they think while such things are theoretically good it is practically impossible to obtain such conditions.

Proper methods and farm implements have decreased the labor of preparing the seed bed. Actual demonstrations without number, by different experimental stations, have shown that one acre rightly prepared will yield more than two acres seeded when in poor condition. It of course requires more energy to prepare it properly, however, it is time well spent. You have but the cost of seed for one acre and the cultivating requires only one-half the time. The other acre of land can well be used for other crops.

Making a Fine, Firm Seed Bed

To secure soil of the proper texture and fineness, we must begin with the plowing. Much depends on doing this correctly, for instance certain clays when plowed wet will puddle, and become so hard and lumpy that no amount of work can get them in shape for planting in one season. The correct time for plowing and the manner in which it is to be done is a study in itself. It depends upon the territory, upon the soils, the nature of the crops, and many other conditions.

Once the field is properly plowed, the work of obtaining a fine seed bed is well begun. For years the accepted method has been to follow the plow with a harrow. This is a good implement as far as it goes, but it does not go far enough. The best it can do is to scratch the surface to a depth of three or four inches, and on some soil it will pulverize the lumps very fine to this depth. The farmer realizes that it does not work deep enough, and often adds rails, stones or other weights to make it cut deeper.

The spring tooth harrow is in some ways a better implement. It pulverizes the top and also digs deep down and brings up lumps from the bottom of the bed. The truth is, however, that no implement which cuts or drags through clods and lumps can entirely pulverize them. The teeth or edges on such an implement hit one lump and miss the one next to it, or simply cut the lump into two lumps, when it should be reduced to particles.

Walking into such a field, you have no doubt tested the soil by striking the lumps with the heel of your boot, and thus crushing them into a thousand bits. That is just the sort of work that must be done by an implement in order to put the field in proper shape.

Soil Moisture

You concluded from your observations in the potato field that moisture is necessary to the growth of the crop. Figures show that to produce one ton of dry matter in corn stalks 271 tons of water are needed, and to make one ton of dry mattter in oats 504 tons of water are needed. In some few territories of course there is no trouble in getting the right amount of water, in fact it is a problem to get rid of it, but in 90% of the farming territory the ground becomes very dry at least during the months of July and August.

With most farmers therefore the problem of saving moisture in the soil for dry months is one of the most important things they have to deal with.

If you will find a field in which the crops are growing well in spite of drouth, you may obtain from it some clue to the manner in which moisture may be saved. Dig in such a field and at a depth of three or four inches you will find moisture even though there has not been rain for weeks.

How did the moisture get there and how has it kept in the soil through a long dry season?

Storing Moisture in Soils

Soil moisture of course comes in the first place from rainfall. Some of the water soaks into the ground and the rest evaporates. That which evaporates is lost and generally enough is wasted in this way to save the crop if it could be kept in the ground and used. If you live in some sections you find that there is often so much mois-

ture that you are glad to get rid of it in the spring, but by proper methods and with soil in the right condition this moisture can be stored and made use of instead of being allowed to evaporate and become lost.

On lands where there is too much moisture in the spring, drainage will take care of it in a way that will be beneficial for the crops. It is better to drain the water away through the soil than to allow it to evaporate because drainage carries the moisture downward instead of allowing it to dry out slowly, and thus form a wet and soggy surface. As the water goes downward toward the drain it tends to make the roots strike downward rather than to grow upward toward the surface, as they will when the surface is wet. Surface feeding roots soon die when drouth comes, and are of very little value to the plant. The deeper the roots can be made to grow the nearer they get to the stored moisture and the better they withstand dry seasons.

In the saving of moisture much depends on the plowing. The depth of soil has a pronounced effect on the way in which the soil retains the moisture. In fact, unless deep plowing is practised many of the best authorities on dry farming maintain that no amount of subsequent cultivation can bring the moisture in the subsoil up to nourish the roots. In some cases subsoil is gashed deeply with a plow made for the purpose in order to loosen it up and make it suitable for receiving and storing large quantities of water.

In the so-called "dry farming" country this question of storing moisture is naturally given the most careful attention. Prof. Ten Eyck of the Kansas Experimental Station says:

"That most important part in soil moisture conservation, the most important factor in dry farming, and the one which has been most greatly neglected by our farmers is getting the rain water into the ground and safely stored or conserved in the subsoil, where it may be drawn upon by the growing crop. The firming and pulverizing of the soil to restore capillarity and the cultivation to maintain the soil mulch are each without avail unless there has been stored in the deeper soil a sufficient amount of moisture to support the growing crop in time of a drouth."

If newly plowed land is left for two or three hours on a day when there is sun and wind, the ground will lose the equivalent of two or three inches of rainfall.

On this point Prof. Bedford of Manitoba Agricultural College says in a bulletin:

"If the newly plowed furrows are allowed to remain as left by the plow for any great length of time, particularly during hot windy summers, a large amount of moisture will evaporate. For this reason the plow should be followed closely by the soil packer. In fact, every day's plowing should be packed before night. This will press the soil closely together and check evaporation at once. Soil will always pack together more firmly when freshly plowed. The following striking results were obtained from the Brandon Experimental Farm in 1914, The average yield from four unpacked plots was 45 bushels of wheat per acre. The average of four adjoining packed plots was 52 bushels and 55 pounds per acre, or seven and a half bushels more than unpacked.

The plow should be followed directly by the culti-packer. The cultipacker will pulverize the top surface and make a mulch, leaving the soil in condition to retard evaporation until the seed bed can be completed.

Land which is plowed in the fall and then gone over once with the Culti-Packer, is left in condition to absorb great quantities of moisture from winter's snow and rain. This moisture seeps down through and is stored in the subsoil. Says J. M. Neale in an article in the Scientific Farmer:

"We could not always get the necessary spring rains to put our lands in proper condition, but often the fall and winter rains are quite sufficient. Let us store them as they come for one inch of rainfull stored in the fall or winter is worth two or three inches in the spring and summer Then we do not always get them in the spring when we want them."

Care in the tilling and preparation of soil is necessary in order to have the moisture there for later use.

Getting the Stored Moisture to the Plant

With the moisture in the soil the work is only begun. The next thing is to get the water to the plant roots at the time when it is needed, and when the rains fail to supply it. You perhaps have noticed foot prints, in a dry field early in the morning. They are dark and moist even though the rest of the field is dry as dust. The explanation of this is that moisture has risen through this soil because it is packed more closely than that around it.

You can illustrate this action of the water by taking a lump of sugar and dipping one end of it in the coffee. The coffee will rise rapidly through the whole lump.

The liquid rises through the lump of sugar because the particles are closely packed together. The same condition is found in soil which has been firmed by going over it with the right kind of an implement. If the sugar were loose, granulated sugar, the moisture would not rise through it. Neither will moisture rise through soils that are loose and open.

Take a small glass tube, such as a thermometer tube and place one end of it in water, and you will see the water rise in the tube above the level of that outside. The rise of oil in a lamp wick is another familiar example of this same principle. The soil is in reality made up of a number of little tubes or passages, and the closer the particles are together the smaller these passages are, and the more rapidly this moisture rises through them. This is called capillary action and is that which must be depended on to bring moisture from the reservoirs below up to the plant roots in time of drouth.

Large Air Spaces Prevent Moisture Rising

There are several things which will prevent this desirable rise of moisture if they are not guarded against. As the furrows are turned over in plowing the furrow slices do not turn completely over against the bottom of the furrow, they stand a little on edge leaving air spaces in between the slice and the furrow bottom. This can be seen by digging down across the furrows in a newly plowed field with a shovel. Often the grass or stubble of the field can be seen in these cracks, and these dry up and remain there instead of decaying as they would if closely packed in the soil.

Then when water begins to rise from the subsoil it will come up to this gap and stop there, and the roots above will die for lack of moisture. The only remedy for this condition is to get the furrow slice packed down in close contact with the bottom of the furrow. This should be done directly after the field is plowed, making a firm continuous bed of soil for the water to rise through.

The only satisfactory way to do this work is to apply a weight heavy enough to bring the furrows down into place.

The Culti-Packer is the most successful impelment for this work. It is heavy enough to make the most stubborn soil yield. The weight is not spread over a large surface but the edges of the wheels cut down through the top of the plowed field and bring packing action to bear down near the open air space, thus closing up all such spaces evenly. The trash and stubble then is packed in with moist earth and soon decomposes and becomes a valuable fertilizer in the soil. Thorough culti-packing directly after plowing will do more to prevent drying out of soils than any other work the farmer can do. Lumps and clods down in the seed bed have nearly as bad effect in retarding moisture ts the large air spaces, as they do not allow the upward passage of moisture so readily as the finely pulverized particles.

How to Stop Evaporation of Moisture

In packing the soil to bring the moisture up there is one difficulty. Moisture to be of value to the plant must remain about the roots. If it comes to the top of the soil as it does in the foot print, for instance, it will be lost. If we pack the top of the field perfectly smooth moisture will rise clear to the surface and be evaporated by the wind and sun. This evaporation is ordinarily prevented by stirring the surface of the field and thus making a mulch of dry earth over the top, thus it is necessary in using a smooth roller to follow it immediately with a harrow or cultivator to stir the surface.

This may be well illustrated with our experiment on the sugar lump. If you sprinkle a little sugar over the top of the lump with a spoon it will be found that the coffee when it rises to reach this point will take considerable time to pass through this loose sugar. This is the principle of the mulch in saving moisture.

The culti-packer performs the work of both the packer and the cultivator, and makes the extra cultivating unnecessary. The wheels pack the soil beneath the surface, making a layer of firm earth at a depth of three or four inches, so that the water rises to this firm earth and remains in the soil about the roots. At the same time the surface of the soil is worked and stirred by the two sets of wheels making the mulch which prevents evaporation. The culti-packer makes this mulch at the same time that it packs the soil thus saving the moisture that would be lost between the time of rolling and harrowing.

Dr. Taylor in his book on Soil Culture devotes considerable space to the important question of saving soil moisture, saying among other things:

"Moisture is conserved or prevented from escaping through surface cracks and insect holes by maintaining a soil mulch blanket on the surface. The culti-packer forms a retaining mulch and at the same time packs the soil about the grain roots. This implement can be used to good profit even when the grain is beginning to joint."

If soil is allowed to form a crusted or baked surface it very rapidly loses all its moisture to a depth of many inches. Cracks open up in the soil and form regular chimneys for the escape of the moisture. This hard crusted top surface is also a good conductor of heat and will carry the sun's heat down to dry up the moisture where if the surface were loose and pulverized it would form a non-conductor to retard the heat of the sun's rays.

In dry weather occasional work in the field with the cultipacker will bring to the roots every available drop of moisture, thus nursing them through drougths that would otherwise prove fatal.

Starting the Seed Right

There is no question that starting the seed well has a great influence on the later growth of the plant. It used to be common practice especially in garden planting to soak seeds a little to soften the outer envelope, and to start the sprout before they were planted. We can obtain practically the same effect by proper teratment of the soil when the seed is planted.

Strangely enough, packing the soil after seeding has never been thoroughly appreciated. A writer in Pacific Farmer states:

"The rules for securing water for our cultivated plants are well known, though for the most part not much observed in the United States. Use the packer after planting in order to make the soil firm and to assist the seed in getting the moisture from the lower layers of soil by means of capillarity."

Prof. Ten Eyck of Kansas Agricultural College says in one of his practical articles:

"To secure the ideal condition for seed germination and plant growth, a seedbed for planting small seeds should not be too deep and loose. The soil should be mellow and well pulverized but below the depth at which the seed is planted, it should be firm and well settled, making a good connection with the subsoil, so that the water stored therein may be drawn up into the surface soil and supply moisture to the seed. The loose, deep seedbed is almost wholly dependent upon rains for sufficient moisture to germinate the seed and start the young plants. In such a seedbed the crop is more apt to 'burn out' in summer or 'freeze out' in winter, than a crop grown in the 'ideal' seedbed described above."

You perhaps have observed that wheat or other grains will often grow higher at the ends of the field where the horses turn when drilling planting or cultivating. The weight of the machine and the horses' hoofs firms the soil about the seed and thus it gets the start of that in the rest of the field. Wagon tracks can often be traced in a field for the same reason.

As mentioned before the culti-packer is an ideal tool to precede the drill, as the drill wheels will cut through the loose surface left by the culti-packer, and plant the seed bed down in the firmer soil, leaving the loose soil on top to act as a mulch in retaining the moisture. This produces a condition which could not be excelled even by the most careful hand gardening methods.

Sunflower Seed in Grain Ration.

We grow quite a few sunflowers. Will you kindly inform us how to feed them to fowls or what other use we can make of them? We have taken this magazine for several years; it has been a great help to us.—B. J.

Although rather expensive, sunflowers are chiefly grown for their seeds which are fed to birds and poultry. In Europe and some parts of the United States the seeds are a source of oil, while occasionally the green stalks are made a part of the silage mixture. The seed is given to poultry just as it comes from the flower, or crushed so that the fowls may consume the white, meaty part alone. Fowls in poor condition seize the unbroken seed greedily, while those which are fat and plump take to the crushed seed more readily. Some poultry raisers are accustomed to mix the seeds in the grain ration during October and November or in the early molting season.

Control for the Leaf Spot of Beet.

1. Deep fall plowing and crop rotation is the most satisfactory method of control. Beet tops should be plowed under in the fall, to a depth of 10 inches or more.

2. Care should be taken that no diseased leaves are scattered to fields intended for beets the following year. Do not allow live stock to enter fields to be used for beets the following year, until several days after they have been taken off the beet-top pasture. The spores of the leaf spot fungus pass through the alimentary canal of cattle uninjured.

3. Manure from stock fed with diseased beet tops should be applied to the land one or two years in advance of the beet crop.—Otto A. Reinkingi Colorado Agricultural College, Fort Collins, Colo.

An Appreciation of the N.S.B.A. and the Maritime Winter Fair.

Strong and well established associations have been towers of strength in enabling various trade classes to overcome otherwise insurmountable obstacles. History always repeats itself along this line. The Maritime Winter Fair, the child of the Maritime Stock Breeders' Association, is no exception to the rule. Until a few years ago our Maritime stock breeders had overlooked the scriptural injuction: "Neglect not the assembling of yourselves."

It is now less than twenty years, since the most optimistic stock breeders of the Maritime Provinces began to realize that there was no reason why the pure bred stock that was every year required in the provinces by the sea should not be largely produced here. But to do it they must be up with the times. They must look after their own interests and fight their own battles.

They realized that live stock was at the base of the best and most progressive systems of agriculture. With this awakening came the noticeable fact that the livestock industries of the respective nations of the world was commensurate with their Association life. If a nation had a strong and well managed live stock association the livestock interests of that nation flourished. If organization and concerted effort was proving well everywhere else, why not in the Maritime Provinces? The time was ripe for the breeders of the Maritime Provinces to do something to protect their business and educate themselves to a higher standard of breeding.

Some means to secure an efficient registration of stock required immediate attention. Certificates from provincial herd books, for some cause or another, were not accepted as guarantee of pure breeding and were therefore worse than useless. It was time to make a move for a Maritime herd book. Then there were matters in connection with the management of the provincial exhibition and the transportation of live stock that required special attention. The individual exhibitor or stock shipper had no redress for his grievances. He was sadly in need of the moral support of his fellows.

With these thoughts in view, a band of progressive, optimistic stockmen met in the Victoria Hotel, St. John, on September 30, 1896. Included in the group were men with a vision of the possibilities for stock breeding in the Maritime Provinces along business lines: E. B. Elderkin, F. E. Page, E. Baker, W. W. Black, C. M. Holmes, Amherst; C. A. Archibald, Truro; M. H. Parlee and W. W. Hubbard, Sussex; Donald Innis, Tobique River; J. H. Reid, Fredericton and J. F. Frost, Hampton, composed the little pilgrim band.

E. B. Elderkin was appointed chairman and C. W. Holmes, secretary.

On motion of Mr. Page, seconded by Mr. Parlee, it was decided to call a meeting of breeders to meet in Moncton on the 29th of the following December. Registration of Pure Bred Stock, Exhibition Management and Railway Tariff on Live Stock were subjects suggested for discussion.

A list of one hundred names was compiled to whom the call for the December meeting was sent. An enthusiastic band of twenty-four tried and true men answered the call. The close of the year was an opportune time to make new resolutions. The meeting was held in Orange Hall. Messrs. Elderkin and Holmes took their respective places as provisional president and secretary and there and then The Maritime Stock Breeders' Association was organized. Officers were elected and strong committees were appointed to interview the various bodies that had to do with the interests of the stock breeders.

THE IMPORTED PERCHERON STALLION GLENEUR
Owned by Wm. Jamieson, Sussex Corner, N. B.
Gleneur is now offered for sale. See ad. on another page of this issue.

As we recall the list of names of those who helped to launch the M. S. B. A. we are reminded of the changes wrought by Father Time. Not a few of the fathers of this important organization are no longer actively engaged in stock raising. Several of the number have passed to the great beyond. Other men have stepped in to fill the ranks and perpetuate the good work so well begun. And we are pleased to say that some of the original band still have their hand on the helm and with a clear brain and eye are still guiding the destinies of their pet organization.

It is needless to mention in detail the names of the men who have from time to time given of their services, either as officers or as committee men, to the Association. Suffice it to say that many of them were and are men of a calibre broad enough to get a favorable hearing before government committees, corporations and all other bodies that in any capacity could serve the best interests of their association. We have yet to hear of a case where they were not kindly received and their wishes complied with so far as it was possible to do so. In fact governments and corporations were always delighted to have the farmers wishes brought to their notice. Nothing unreasonable was ever asked for and men in authority appreciate the fact.

Through the united efforts of Live Stock Associations, east an west, the Herd Books are no longer provincial nor local in character. They have, thanks to the high ideals advocated by the breeders' associations, become national in scope and eligible to international recognition.

Exhibition managements have revised their prize lists to conform to the wishes of the breeders and have established a fairly satisfactory circuit. It is true that Fredericton and Charlottetown clashed dates this year. The boys say they will "W(Hooper) up" or make a lot of Kindling wood, no, we think (Smallwood) was the word they used, if these two fairs again clash dates.

The railways have also lent a listening ear and the various grievances re transportation facilities and charges have been ameliorated. There are very few complaints to he heard nowa-days about the rough handling of stock in transit. If employees are at any time inclined to be dilitory in moving stock within a reasonable time a message to headquarters in the name of the Maritime Stock Breeders' Association brings instructions to give train So-and-So a clear road to destination as expeditiously as possible. These and many other redresses have been secured by the M. S. B. A.

Questions demanding the attention of the breeders have been discussed and acted upon at the various meetings and so the work of educating the farmer to seek his rights has gone on. There are still some men outside the pale of the Association who are gleaning the benefits for which the M. S. B. A. has worked so faithfully. The membership fee is only one dollar per year.

Lest the idea should go forth that the M. S. B. A. was organized solely for the benefit of the breeders of pure bred stock and that such men alone are eligible for membership, we would say that such is not the case. Every one who is interested in the welfare of the country is eligible for membership. Neither is the work of the Association devoted entirely to pure bred interests for it is recognized by all that it is from the grade cattle, sheep and swine of the country must come the major portion of our milk, wool and meats. The Association only preaches pure bred doctrine for the general farmer in so far as it will help him to make his grade stock better for the purpose in view.

The Association grew apace in wisdom and stature and in favor with men. On December 17th to 19th, 1911, the first Maritime Winter Fair was held. The best farmers of the three provinces were therer. They had not gone there for fun. They had heard of the great Guelph show and its benefits and they purposed testing the truth of the matter at Amherst. No more orderly or enthusiastic gathering could be recorded. Men breakfasted, hurried to the rink where the fair was held, drank in the lectures of the experts, returned for dinner and again hurried away on the same mission. Evening come, they joined with the citizens at the town hall and there again were treated to the best efforts of the country's best minds. As a show, as an educational undertaking, as a social event or solely as an intermingling of farmers the first Maritime Winter Fair and the fairs since held have been standards to which the M. S. B. A. can look back with a feeling of pride. The readers of the Maritime Farmers are familiar with the rapid growth of the Fair. Larger and better accommodation for stock has been found necessary from time to time and in due time the various changes have been effected. Such changes are being made this year so as to accommodate the stock of the old exhibitors and that of new exhibitors who have been working their herds and flocks up to the high standards of ideals set for their chosen bred or breeds at Amherst. These young men are ever ready to learn; they are not content to come to the fair and remark at the ringside that they have just as good animals at home as is shown in the ring. They are ready to show to the world that they have the courage of their convictions, and not a few of the older exhibitors have to look well to their laurels.

The lectures, and demonstrations too, have done good work. Many excellent ideas advanced on the platform and in the ring have been carried home by our farmers and given a practical test on their farms. Ideas tried, proved and not found wanting are continually being practised.

Exhibitors of scrawny, ill fed and ill groomed stock have long since learned that The Maritime Winter Fair is no place for them and not infrequently the animals outside the money prizes would make an excellent showing by themselves.

The quality of the stock shown at Amherst has showed a steady improvement from year to year. As we travel through various sections of The Maritime Provinces we can see the influences of the fair. Our farmers are gradually coming into line for better feeding, breeding and selection.

The fat stock section of the fair compares favorably with those held elsewhere in Canada. The dairy tests bring out the largest number of individuals of any similar test in the Dominion and better than that time and again Canadian records have been broken at Amherst and that by Marittime bred cows. The boys are ever ready to assist each other in the care of stock and their interchange of experiences re herd and flock management is not the least educational feature of the Fair.

From a small beginning the M. S. B. A. has extended its influences like the Nova Scotia Agricultural College until the three provinces are feeling the throb of a new agricultural life. The work of the Association cannot be gainsaid nor denied and he who refrains from visiting the Fair does so to his own detriment.

Of all the men who ever took part in the Maritime Winter Fair we believe no one ever did more to encourage and assist young exhibitors, even when they were his own competitors than did the late Wm. Robinson, who was for many years herdsman for Mr. W. W. Black. Many a young exhibitor owes his inspiration to him. Mr. Robinson is gone, but his good work and kindly assistance remains a tribute to his memory.

To the readers of the Maritime Farmer, we say: Visit the Winter Fair and take it in good faith that if you do not find something there to inspire you to higher ideals and a broader conception of your calling there is something decidedly wrong with you

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that, in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building, 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

NOVEMBER 23, 1915.

DATES OF ISSUE.

December 7-21
January 11-25
February 8-22

FARM EXPERIENCE BEFORE COLLEGE.

Experience of farming in at least some of its phases is of high importance to young men who enter the colleges of agriculture. Without it the best that instructors can do with the excellent facilities at their command is to a considerable extent nullified. Graduation from an accredited high school does not provide the student with a sufficiently broad foundation upon which to begin the stury of agriculture, unless he has had a great deal to do with practical farming operations. Boys reared on farms have an immense advantage over city boys without farm experience in pursuing the studies embraced in the regular courses at these institutions. Moreover, the presence in a mixed class of students altogether unfamiliar with farm practices complicates and inhibits the work of painstaking instructors.

So valuable is farm experience to freshmen in the colleges of agriculture that, in justice to the students themselves, to say nothing of their farm-reared fellows, and the instructors, the time may come when the leading institutions will require a given measure of contact with practical farming on the part of new students. Graduates of high schools, who in many cases are in a feverish haste to complete their schooling, and forthwith tackle the agricultural world, would do infinitely better work, and get much more out of the courses, long or short, if they would spend an active year or two on farms before entering colleges of agriculture. It is too much to ask that these institutions, already overflowing with farm-reared young men and women, should devote their time to elementary teaching. Agricultural high schools and other minor institutions of learning in which instruction and some practice in agriculture are given are doing much and will do much more to prepare students for the most effective work in the colleges. At present, however, the situation in some places is discouraging to agricultural educators. It ought to be changed.

THE FAT OF THE LAND.

It was a country cellar. Along one side in well-built bins was a supply of potatoes and apples enough to last throughout the winter. All the apples had been hand-picked, and the different varieties kept separate. Even the potatoes were sorted as to size. Beneath the bins and packed in sand were dozens of stalks of home-grown celery. In another part of the cellar was a barrel of vinegar and in another a barrel of sweet cider. There was also lard, white and sweet, from the last butchering. Then there was the fruit cellar proper,, partitioned off from the main basement. Here was a wealth of canned fruits, pickles, jellies and preserves—in all, more than "57 varieties."

In this farm cellar there was not only an abundant supply of wholesome food, but here one answer to the high cost of living question.

There is need of a revival of the old-fashioned country cellar. Vest pocket purchases mean high prices. It must be so. Merchants cannot afford to handle goods in small quantities and make daily or hourly deliveries without charging more. Somewhere between the simple life, with its lessons of saving, and what someone has called the "delicatessen life" may be found one cause of the increased cost of living.

City folk cannot always enjoy such conveniences as a cellar; they cannot always buy and keep vegetables in bushel or barrel quantities. With the average farmer it is different, yet there are farmers who buy the very things that they should have to sell, and, worst of all, buy in small quantities. Right now the farm cellar should be a real picture of plenty.

A POINTER FOR OPPONENTS OF NATURE STUDY.

Prof. S. B. McCready, of Ontario, says:

When country people rediscover their own schools and get their eyes opened to the rich possibilities that lie in education of the right kind for them as farmers, we are going to see a great advance in rural districts and the cause of agriculture.

"We may have to wait until the next generation makes its influence felt, but the country leaders who are developing in our schools through the proper teaching of agriculture will undoubtedly exert a great influence when they "arrive." The place of the new kind of country teacher who will come into being will then be exalted and a new kind of school (or different new kinds of schools) to more adequately meet the country's needs will be formed. As man's continual struggle with nature in his agricultural work is to be the moral equivalent of war, so through the teaching of agriculture are country people to find new schools and new possibilities in education."

PAINTED BUILDINGS GOOD SIGN OF THRIFT.

Few people realize the value of paint either as a preservative for buildings or for the good appearance of the premises. Even a very unsightly old building may be brought to look acceptable, if given one of two coats of good quality paint. Nothing serves to bring the atmosphere of thrift to a run down farm as much as the unstinted use of paint.

The color of paint to be uesd is, of course, left to the best judgment of the person having the painting done. The thoughtful farmer will choose some color scheme and carry it out, for he will realize how much this will enhance the appearance of his farm. Imagine for a moment the difference in the appearance of two farms, one on which the farm house and out-buildings are all painted pure white or white trimmed in some suitable color; the other with no two buildings the same shade. It would not be difficult to decide which is the more pleasing of the two. It must be borne in mind that dark colors do not show up to the same advantage as those of a lighter shade. White or light colored buildings always look larger than those of the same size of a dark color. Light colored buildings can be seen at a greater distance than those which are painted in the darker shades.

Good paints are now placed upon the market at such a low cost that they should be uesd simply for the purpose of cleanliness and for the preservation of the buildings, if one does not prize the thought of beauty in connection with one's home.

HEAD WORK NECESSARY.

People do not stop to consider the amount of time that might be saved if a little more intelligence were exercised in tasks done two or three times a day. To illustrate this, take the matter of having the milk room inconveniently located. If the milker carries the milk of each cow 50 feet farther than need be, that means three rods and back each milking, or twelve rods per cow per day. If a man milks 12 cows it causes the extra labor of carrying a pail of milk 72 rods and carrying back the empty pail each day. In a herd of 60 cows, the milkers would walk 360 rods and back, or a total distance travelled of 2¼ miles per day. For a single milker it would mean 164 miles extra walking per year. If a man commenced doing this when he was fifteen years old and kept it up for fifty years, he would have walked 8,200 miles, or one-third the distance around the world. Yet all this labor might have been saved by a little head work in planning the arrangement of the building so as to make it unnecessary to carry the milk the extra fifty feet.

If this saving of time be true, with simply the operation of milking, what does it mean when all the numberless details of feeding, cleaning out stables, bedding, etc., are considered for a lifetime? It means the saving of several trips around the world for the dairyman. The dairyman who uses his brain sufficiently to fully appreciate and put into practice true dairy economy, can and should make trips around the world, but doubtless he would appreciate this travelling better if it were done in a Pullman car and ocean liner, than in his own cow stable.

COULDN'T MILK A BICYCLE.

A farmer went itno a hardware store and after making a few purchases was asked by the proprietor if he did not want to buy a bicycle. "A bicycle won't eat its head off," said the man, "and you can ride around your farm on it. They are cheap, now, and I can let you have one for thirty-five dollars."

"I'd rather put the thirty-five dollars into a cow," replied the farmer.

"You'd look mighty foolish riding round your farm on a cow," said the hardware man sarcastically.

"No more foolish than I would milking a bicycle," replied the farmer.

Seaweed as Fertilizer.

Some 14 years ago the Maine station published a bulletin on seaweeds common along the coast of Maine. This publication is now out of print. A few of the more important points relative to the use of seaweeds as manure are here presented. The principal deeper water seaweeds are two species of Laminaria, the ribbon weed or kelp; and the broad ribbon weed, or broad-leafed kelp, frequently called devil's apron. Perhaps three-fourths of the shore weeds covering the rocks between tide marks are two species of Fucus, the flat-stalked rock-weed and the round-stalked rock-weed. The specimens collected in the winter months carried for the most part much more nitrogen, phosphoric acid and potash than the same species collected in the summer season. On this account it is advisable to collect the seaweeds during the winter months, and if it is not convenient to apply them at once to the fields, they may be stored in large heaps until spring.

While the different species of seaweeds probably differ in composition, not enough samples have been examined to clearly indicate that fact. Winter collected seaweeds, both kelp and rockweed, carry about 80% of water, 0.4% ntirogen, 0.1% phosphoric acid, 0.5% lime, and 0.6% potash.

On account of the large water content and consequent weight of seaweeds, transportation far inland is not profitable. A part of the water can be removed by spreading out thinly on the shore and allowing exposure to a hot sun for a few days, but it is a question whether this practice is economical on account of the increased labor involved, and if the material is leached by rains after it has become partially dried a part of the fertilizing constituents are lost.

Seaweeds decomopse rapidly, so that their fertilizing constituents become speedily available. As they have no power of absorbing liquids there is no advantage in composting them. They are best applied directly in the green state.

Seaweeds produce their chief effect the first season. This adds rather than detracts from their value as a fertilizer, since when they can be obtained at all they can usually be had one year as well as another, and can be applied annually.

The analyses shows that seaweeds are not evenly balanced manures. They contain relatively considerable amounts of nitrogen and potash and but little phosphoric acid. Consequently land dressed for a long time with seaweed alone becomes exhausted in phosphoric acid unless a large excess of manure is added which would be wasteful of the nitrogen and ptoash. Excellent results have been obtained by using phosphates with these manures. Dissolved bone or acid South Carolina rock may be used, 300 to 500 pounds to the acre, with 20 to 30 tons of the fresh seaweed.

With most crops the best results are obtained by applying the fresh material in the spring and either plowing or harrowing it into the soil, but potatoes and some root crops, like the sugar beet, are said to be injured in quality by spring applications. This is probably due to the large amounts of chlorides of magnesia, sodium, etc., they contain, as it is well known that these substances have the effect of depressing the amount of starch in tubers and thereby impairing the quality. Farmers who use seaweeds for a potato manure can overcome this difficulty by applying it to the fields in the fall before planting in the spring. In this way potatoes of much better quality, it is claimed, are grown, than by applying the seaweeds at the time of planting.

In some localities seaweed is applied as a top-dressing to mowing fields, but if applied fresh in the summer season care must be taken not to apply too thickly, as there is danger of killing out the grass, especially on new fields. Some farmers prefer composting for this purpose with stable manure in order to fine the material so that it will spread more evenly over the field It is probable that the addition of acid South Carolina rock to the compost would greatly increase its value and aid in holding the amomnia. If the fermentation is carried very far land plaster or muck should be spread over the heap to prevent ammonia from escaping.

Eel grass is not a true seaweed, but belongs to the pond weed family, a group of mostly fresh water plants. Eel grass carries about the same amount of plant food as the seaweeds, but it is only with difficulty that it can be made available. Eel grass will hardly rot anywhere, either in the soil, in the hogpen, or in the manure or compost heap. When dried it is used as a filling for cushions, mattresses, etc. But the plant has no agricultural use.

A good dressing for potatoes would be had by applying 20 tons of winter-collected green seaweed, 400 pounds of acid phosphate, and 100 pounds of nitrate of soda to an acre. This would give about 100 pounds of nitrogen, of which a sixth is immediately available, 75 pounds of phosphoric acid, 100 pounds of lime, and 120 pounds of potash.

Seaweeds have, in common with commercial fertilizers, the advantage of freedom from weed seeds. the spores of fungi and the eggs of insects. In Rhode Island, where sea weeds are quite largely used as a manure for potatoes, the farmers are almost unanimous in saying that potatoes grown on seaweed are smoother and freer from scab than those grown on stable manure.—Dr. C. D. Woods, Maine.

Land in the Maritime Provinces.

Excepting Prince Edward Island and Alberta, New Brunswick and Nova Scotia have a greater percentage of land fit for agriculture than the other provinces of the Dominion, according to the Canada Year Book, issued by Sir George E. Foster's department. Almost all of Prince Edward Island is fit for cultivation, and almost all of it is already cultivated. But while New Brunswick has 10,718,000 acres officially recognized as capable of devotion to agriculture, only 4,537,000 acres are actually in use. That is to say, while we might be using for agriculture sixty per cent. of the total area of the province, we are only using 25.44 per cent. at present. Thus, according to the official reports on this subject, we had in New Brunswick in 1911, 6,181,000 acres fit for agriculture but lying idle —and the Canada Year Book says these figures "take no account of forests and swamp lands which may ultimately be tilled."

Ninety per cent of the land in Prince Edward Island is classified as fit for agriculture, and eighty-six per cent. is so occupied. In Nova Scotia sixty per cent. of the land is fit for agriculture, and thirty-eight per cent. is so occupied. In Ontario and Quebec the amount of land unfit for agriculture is astonishing. Only ten per cent. of Quebec is returned as capable of being tilled, and only 3.53 per cent. of the total is under cultivation. In Ontario only twenty-five per cent of the total is capable of being farmed and only 9.47 per cent. is so occupied. In Saskatchewan the proportion of land fit for agriculture is the same as in New Brunswick and Nova Scotia—sixty per cent. In Alberta it is sixty-five per cent., and in British Columbia it is twenty per cent. While the total area of Quebec is twenty-five times as great as that of New Brunswick, Quebec has only a little more than four times as much land fit for cultivation. Ontario's area is more than thirteen times that of New Brunswick, but it has only six times as much land fit for farming.

According to Sir George Foster's book Nova Scotia in 1914 had 693,860 acres in field crops while New Brunswick had 904,055, yet the value of Nova Scotia's field crops in that year was $21,969,700 and that of New Brunswick's $20,045,100. When we seek an explanation of that it is found, to some extent at least, in the numbers of live stock owned in 1914 by Nova Scotia and New Brunswick respectively. New Brunswick had a few more horses than Nova Scotia that year, but Nova Scotia had 128,237 milch cows to 102,713 for New Brunswick, and 148,269 other cattle as against 99,256 for New Brunswick. Nova Scotia had 211,921 sheep, and New Brunswick 121,739. New Brunswick had 73,325 swine to 53,892 in Nova Scotia. The cattle of Nova Scotia in 1914, including milch cows, were valued at $9,300,000, while those in New Brunswick were valued at $6,700,000. The average value of the farm lands of Nova Scotia is given as $18.13 in 1911 as against $14.21 for New Brunswick. The Prince Edward Island value is $25.85, that of Quebec $40.88, that of Ontario $41.77, that of Manitoba $30.47, that of Saskatchewan $23.10, that of Alberta $21.70 and that of British Columbia $67.28. The Canadian average is $30.41.

There are many other interesting statistics in Sir George Foster's book, but perhaps nothing in the whole work stands out more conspiciously as demanding attention than the great area of unoccupied land in New Brunswick and the comparatively small production of the land already under cultivation.

Today the energies of this whole country are properly directed toward the successful prosecution of the war. All other questions are, and must be for some time, subordinate. Yet the very war itself makes it necessary to look ahead in many directions. One of the things to be expected is that there will be a large immigration after peace has been concluded, and consequently a demand for land in agricutlural countries. Also, the world, shaked by enormous losses in men and goods, due to years of destructive war, will have to fall back upon greater production from the land, which after all is the source of all wealth. Having these things in mind public men in this province should be studying measures to increase prdouction from the land already in use and to prepare the immense area not yet in use for productive settlement by the land-hungry of the world.

Fall Plowing Serves Best.

Fall plowing is sometimes more important than the use of fertilizer on fresh-plowed ground. A striking case in point is that of a piece of land on the Horticultural Farm of the College of Agriculture, Truro, N.S. In the fall of 1914 a strip two rods wide was broken up from virgin soil for use in experimenting with fertilizer, and was allowed to lie fallow till the next August. It was then replowed, and one of the two rods was fertilized. At the same time an adjoining rod of virgin soil was fresh-plowed, and then the whole three rods were sowed with buckwheat and plowed under. The result was that the fall-plowed ground showed a growth at least five times as great as the land which was merely plowed and fertilized at the time of sowing.

Now, this, it must be admitted, is an extreme instance of the gains due to fall plowing, but it clearly shows to farmers of the Maritime provinces the great importance of the practice. Moreover, it is the best assurance a farmer can have of getting his crops early in the ground in the spring. For the farmer at that season is always under a rush. Further, if May happens to be wet and plowing must be done that month, the few fine days that appear must be used for plowing instead of for seeding. On the other hand, the farmer who plows in the fall feels sure all through the winter months that he is "ahead of the game," and that his crops will be put in early enough to insure maximum yields.

Also, it must be remembered that fall plowing puts the land in an open, rough condition that gives the frosts the best chance to pulverize and to mellow the heavy, inert particles of soil. In short, for you farmers the frosts and sunshine, the freezing and thawing, will cultivate your farms for you the whole winter long. You will then have land in the best condition for spring harrowing, and mellow seed-beds easily worked up, while the fall plowing will have killed off the cut-worms. Do not, then, let the spring work rush you and your horses. Get ready in the fall. Be forehanded with your plowing.

Potash Problem.

Important, if true, is the announcement last week that a chemical process had been perfected for extracting potash from feldspathic rocks. It is claimed that the new method will do this so cheaply that potash from this source in a form equally available to plants, can be sold in competition with German potash salts under normal conditions. The problem has been attacked for years, but without practical results. Some granites and rocks rich in feldspar contain 3 to as high as 10% of potash, but until now no way has been discovered of separating out the potash in a condition so that it would be available to crops. If the potash-containing rock is simply ground, its potash is but little if any more available to quick growing crops than in the rock state. To use such ground rock as a source of potash in fertilizers would be a downright swindle. A mine of potash salts in Death Valley, Cal., indications of such deposits in Texas, and utilizing the vast kelp (seaweed) areas of the Pacific coast, have summed up our new potash supply. It looks now as though little if any potash could be had from Germany for use the coming spring.

The Application of Fertilizers to the Soil, and Losses by Leaching.

Experiments with a lowland clay loam soil, a red clay hill soil, and a sandy clay soil with reference to their absorptive powers for fertilizers are reported by J. T. Crawley and W. B. Cady, of the Porto Rico Experiment Station.

The results as a whole indicated that phosphoric acid is very quickly and firmly fixed in all the classes of soils, but that there is an appreciable loss from the light sandy soils when the fertilization is followed by repeated irrigations. The nitrogen losses, while the greatest, were of material consequence only in the sandy soils. The clay soils fixed the nitrogen quickly and held it firmly. Potash was lost from all the soils, but in small quantities except in the case of the sandy soils. It is stated that heavy rainfalls or irrigations may wash the potash out before it is fixed, especially from sandy soils, but after becoming fixed it is washed out only in small quantities. There was very little loss of fertilizers from clay soils even after very heavy rains or irrigations. It is thought that there is not the same reason for thoroughly mixing the fertilizers with sandy soils as with clay soils, owing to the tendency for moisture to diffuse the ingredients. It is suggested also that fertilizers should be applied in small and frequent doses to sandy soil rather than in large doses at long itnervals.

HORTICULTURE.

Spraying the Orchard Through Pipes.

Probably never before has the apple been given so much attention as during the past decade. The evolution of the apple industry in this and other countries has been most marked, bringing into the fields of industry, science and inventive thought that have made possible a development which for many centuries would have been regarded as impossible. With these possibilities we see great barren fields, for many seasons neglected because of their apparent uselessness, turned into garden spots of great beauty.

With the modern idea of eliminating waste, the apple is judged guilty of contributing more than its share. We will look back, for instance, to the days of our fathers and remember distinctly his methods of harvesting the apple crop. The unsprayed trees were shaken violently until every apple was on the ground, the best of which were loaded into the bed of a wagon and taken to town for sale. Seventy-five per cent of the crop by this method of growing and harvesting was lost. What we see today is quite different, when those same trees, by proper spraying and handling of fruit, are made to produce crops ninety-five per cent of which are perfect in quality.

We find the modern grower advancing new ideas, until today the orchard man is among the keenest advocates of waste elimination and thereby enabled to really enjoy the "fruits of his labor."

Among the latest of successes in correct orcharding is the so-called piping system, whereby commercial orchards can be sprayed in one quarter of the time required by the older methods. The saving realized by the use of this system is most gratifying to the fruit grower and well worthy of mention. The horse, so faithfully a part of the old spraying outfit, is no longer needed. Instead, the power is stationary, in the form of a central power plant located at the most suitable, but preferably high point, from which galvanized pipes are laid through the orchard, allowing four rows of trees between the lines. One hundred feet apartl along the pipe lines are brass bibbs threaded for hose connection, to which one hundred feet of rubber hose can be connected for spraying. A few gate valves are necessary on main lines and at points where branch lines connect. For general use, three-quarter inch pipe is found to give best results, although one-half inch can be used on short lateral lines.

Unless the elevations above the engine are more than two hundred feet, most any power spray outfit will pump the solution to all parts of the orchard. For the level lines, two hundred pounds pressure at the pump is sufficient, while gravity spraying is possible at extremely low points, although the spray solution must be kept agitated in the spray tank while leaving in its downhill course. At the end of each day's spraying, the pipes used should be flushed with clear water, and in the fall drained.

In large orchards a saving of from four to eight hundred dollars each growing season can be realized by the use of this system.

With this key to economy, commercial fruit growers will be better able to withstand the uncontrollable losses that often confront them.--By F. H. Schroeder.

Overplanting Western Apples.

There has been such a heavy planting of apple trees in the northwestern states that some well-posted observers think the apple business has been over-done. W. L. Kidston of the state of Washington has this to say in a recent article:

"Growers in the Pacific northwest are concerned as to the apple market, not because of the deluge coming, but the trees that are coming into bearing in the whole northwest about which they know nothing. The growers will not be able to get away from the fact that prices from the 1914 crop taken from 14,000,000 bearing trees in the three states of Oregon, Washington and Idaho were ruinous. What will the prices be with the crop from nearly 10,000,000 more trees coming into bearing this year, 1915?

"They are still planting in Walla Walla county. At no year in its history has it set out more than 7000 apple trees, yet in 1914 they set out 21,000 young trees. It could not absorb the northwestern apple crop last year, and it will not absorb practically twice the tonnage this year."

There are 28,000,000 apple trees growing in the three states named, half of which are in bearing according to the figures presented by Mr. Kidston. The other half will come into bearing within the next two years. According to the Orange Judd apple crop report, these states produced less apples than last year instead of the increased tonnage which Mr. Kidston predicted. The following figures are of interest:

1915 Apple Crop, with Comparisons.
(In round thousands of barrels.)

	1915	1914	1913
Oregon	600	950	750
Washington	1,950	2,150	1,200
Idaho	150	230	250
Total	2,700	3,330	2,200

If the above crop of 1914 was produced on 14,000,000 apple trees, it shows an average of only 23 quarts or nearly three pecks per tree. An average yield of this size is not enough to make a sound-headed business man enthusiastic to pay several hundred dollars per acre for bearing orchards. New York produces nearly twice as many apples as the three states mentioned, while Michigan, Pennsylvania and Ohio each surpass or practically equal it.

The Baby Barrel.

The new half size apple barrel, the barrelette or baby barrel as it is sometimes called, is meeting with the full approval of all who have seen it. It will undoubtedly be used to quite an extent this fall, as several fruit men have already signified their intention of packing some of their fancier grades in this sized package. Experiments in facing the baby barrel seem to show that the standard-sized facing apples make a tight and compact first layer and show up very attractively when the barrel is opened for display. Corrugated caps of the proper size can be secured from any of the larger supply houses, and a press can either be purchased especially made for this small size or the standard press may be used by bending in the ends of the two arms, using a short piece of hard wood for a header block and another short piece as an upright to fill in the space between ethe header block and the end of the screw when pressing down the head of the barrel. The cooperage manufacturers claim that for the baby barrel they must charge this year something more than half the price of the standard size, but say they can reduce the cost another year if the demand for this smaller package warrants its manufacture in larger quantities than at present. Those who saw the baby barrels packed with Stayman Winesaps and Grimes Golden at the Winchester Fair reecntly were most enthusiastic over their possibilities as popular commercial packages and predicted a large demand for them in all markets. Several well-known foreign buyers have expressed the opinion that the baby barrel would prove very popular in the English markets and that also the fruit would stand a better chance of arriving in proper condition in the smaller package, as there would probably be less bruising from crushing and grinding of the loading slings.—W. P. Massey in Virginia Fruit Grower.

Plums Good Orchard Fillers.

Peaches, pears and the shorter lived varieties of apples make the most satisfactory fillers for standard apple orchards. As a general thing plum trees are not used for this purpose, but where a ready market is found for plums they are very satisfatcory.

A "filler" is a tree planted among longer lived fruit so that it may produce fruit and be removed by the time the permanent trees grow so large as to need the space. Peaches produce fruit usually the third year and are quite desirable fillers, yet peach trees spread considerably and usually have already interfered with the growth of the apple tree before removal, frequently causing permanent injury.

Plum trees are comparatively short lived and do not grow so very large and spreading. Another advantage of plums over peaches is that there are very early blooming varieties as well as medium and late blooming. The Japanese group bloom early, while the European group come along later. By selecting a number of varieties, therefore, the danger of entire loss from frost can be avoided.

Generally speaking, the late varieties are best adapted of fillers.

Protecting Orchard Trees.

As rabbits depend for food quite largely upon the green bark from the trunks of trees or the limbs of those that have been felled, it follows that in the more heavily wooded sections the orchard trees are less liable to damage from this source. I saved a number of small trees last winter by protecting them with bark cylinders peeled from the lesser forest trees, mostly chestnut, while "the sap was up," first cutting rings around the trunk and slitting down the side, so as to have the pieces in form. When these cylinders were placed around the orchard trees I slightly heaped the earth about them. In case of the larger trees, brush was packed around so as to prevent the pests from reaching them.—Frank Monroe Beverly, Dickenson Co., Va.

The New Massachusetts Apple Law

Massachusetts has a new apple grading law with teeth. Although it is not to be effective until July 1 next year the regulations have been completed and meetings for demonstration and explanation are being held throughout the state this month. The primary object of the new law is a bigger and more profitable orchard industry, based mainly on securing more uniform and stable prices for the product. It is believed this can be done only by the adoption of grading and marketing standards so that the purchaser may be sure of getting what he pays for. The means to obtain this object is education and inspection.

The law already printed in these columns states that the secretary of the board of agriculture is to draw up the necessary regulations and enforce the same. This, Sec. Wheeler has done and the accompanying chart is a concise way of telling the grower how to pack his fruit. For example, if he wishes to pack a fancy grade he will find his instructions under the column headed fancy. This gives the regulations for variety, maturity, color shapes, size, condition, manner of packing, tolerance, etc. If he wishes to pack a lower grade like B, he will find his instrutcions in the last column. Thus the chart is self-explanatory. If the farmer does not wish to pack either of the three grades in the chart he can put in anything he has a mind to, provided he labels it "ungraded," and states on the package the minimum size of fruit.

The standard barrel is the same as the federal standard having a capacity not less than 7056 cubic inches. The staves should be 28½ inches in length, diameter of heads inside of staves 17⅛ inches and distance between heads 26 inches. The circumference in the middle of the barrel, outside measurement, is 64 inches.

THE MAN BEHIND THE PRODUCT

It took years of researches and careful experimentation before the combination of rich Oporto wine with Extractum Cinchonae Liquidum (B.P.) could be perfected so as to be borne by the most delicate stomach. Owing to its perfection

Wilson's INVALIDS' PORT

à la Quina du Pérou

has won the confidence of the **Canadian** Medical Profession by reason of the high standard of excellence of this tonic-reconstituant.

WILLIAM THOMAS & CO.,

GENERAL PROVISION
COMMISSION AGENTS
AND BROKERS

29 Tooley Street, - London, S. E.

Having a large connection throughout the United Kingdom, we can secure highest returns for consignments or arrange Cif sales of Frozen Meats, Provisions, Tinned Meats, Tinned Milk and general Dairy Produce.

The present is an exceedingly opportune time for the sale of Colonial goods in England. We invite correspondence.

Cable address—Prodairos Tooley London

A.B.C. Code 5th Edition Used

Any barrel of a different form than this, but of the same capacity, no matter what its dimensions, is a standard barrel. A flour barrel is a standard one. A standard box for apples is 10½ by 11½ by 18 inches, inside measurement, with a capacity not less than 2173 cubic inches. A box of different dimensions, but of a different capacity, is not a standard box, but may be used for packing or sale or distribution of apples of standard grade.

The new law applies to all apples in close packages grown, packed or repacked in Massachusetts and intended for sale either within or without the state; also to apples grown in other states when such apples are packed and handled as conforming to the Massachusetts standard. A barrel, box or other container the contents of which cannot be seen sufficiently for purposes of inspection without removing nails, wire, hoops or metal, cloth or paper strips shall be a close package within the meaning of the law. This includes barrels covered with burlap or other material through which apples cannot readily be seen.

The minimum size of apples sold as standard fancy grade when measured at right angles to the stem and blossom ends shall be as follows for the several varieties: First group, diameter, 2½ inches, Russet, Red Canada, Williams, Yellow Transparent; second group, diameter, 2¾ inches, Baldwin, Ben Davis, Hubbardston, McIntosh, Oldenburg, Palmer Greening, Red Astrachan, Sutton, Wagener, Wealthy, Yellow Bellflower; third group, diameter, 3 inches, Fall Pippin, Gravenstein, King, Spy, Rhode Island Greening, Rolfe and Rome Beauty; fourth group, diameter 3¼ inches, Twenty Ounce and Wolf River.

There must be a statement on the outside of the package in plain letters not less than 36 point Gothic type giving the place, name of state in which the apples were grown, the grade and the true variety. In addition must be the name of the grower or packer and his address. No package is to have marking which is more conspicuous than that required by the law. It is not permissible to label a barrel with "extra fancy' 'or any other statement appearing to enhance the value of the contents above Massachusetts standard fancy grade.

Apples when sold, or offered or exposed for sale in closed packages and not conforming to the specifications for the "Fancy," "A", and "B" grades or, if conforming, not branded in accordance therewith, shall be classed as "ungraded," and so branded.

What Other States Are Doing

That all readers may know how the six states are progressing on this measure, we make the following addition: Vermon has passed the Massachusetts law and it goes into effect this year, although there is no appropriation with which to enforce it.

Connecticut has passed the Massachusetts law and has placed it under the statutes of the general laws, so that no particular organization is empowered with its enforcement.

The law did not pass in New Hampshire or in Rhode Island, but the chances are it will go through at the next legislature.

Maine has been working under such a law for four years, and while their grades read a little differently from the present standard law enacted by the Massachusetts legislature, the idea is that in Maine they will, at their next legislature, conform to Massachusetts grades.

One of the New England leaders says: We are certainly going to keep at this question until the law is practically uniform throughout New England.

Reporting for Rhode Island Prof. A. E. Stene writes: I regret to say that Rhode Island did not enact an apple packing law last winter. The uniform law was introduced and we had preliminary meetings to line up the apple growers to back it. To our very great astonishment one of the growers who is in the legislature and whom we had expected to take up the matter before the legislature, opposed the proposition very strongly and there was also opposition from commission men present. It seemed to those interested, therefore, unwise to push the bill. We have no law at present and I hardly know if it will be possible to get one enacted. Perhaps it will be necessary to wait until some of the opposing forces are convinced of the usefulness of a law through the operation of the act passed in Massachusetts and other New England states.—New England Homstead.

Rules for Packing Apples Under Massachusitts New Law

	"Fancy"	*"B"*	*"A"*
Variety	Only one variety in the same package.	Only one variety in the same package.	Only one variety in the same package.
Maturity	Well matured.	Well matured.	Well matured
How Picked	Hand-picked.	Hand-picked.	Hand-picked.
Color	Above medium for the variety. Color must cover more than one-half the surface normally covered for the particular variety, and must be more than one-half the usual depth.	Medium for the variety. Color must cover at least one-third the surface normally colored for the particular variety, and must be at least one-third the usual depth.	Less than medium for the variety. Color may cover less than one-third the surface normally colored for the particular variety.
Shape	Normal.	Normal.	Practically normal.
Size	Good and reasonably uniform. Minimum for each variety determined by rules. Minimum size to be stated on the package (see Page 10).	Minimum size to be stated on package.	Minimum size to be stated on package.

Apple Syrup.

A Method of Utilizing Wind-fall and Cull Apples—Directions for Making This Palatable Product.

Experiments by government canning specialists show that a very palatable apple syrup can easily be made from apple cider. While it may not be practical for the average fruit farmer to produce apple syrup on a commercial scale, the home manufacture of apple syrup for the family's winter use will furnish a profitable outlet for a large number of culls and windfalls which can not be marketed.

Apple syrup made by the following method is a very palatable product. It has a flavor much like the thick syrup or jelly which is so often formed when apples are baked with a little sugar. As shown by experiments, this apple can be used in cooking with good results, as well as for table purposes.

Reducing Apple Cider to Syrup.

Wash apples and remove all decayed and worm-eaten spots. Press out juice as usual for cider making. Be sure the juice does not ferment or "work," as only sweet cider should be used for sirup making. The sterilizing reducing vat or kettle should be a third larger than required to hold contents.

Add 5 ounces powdered calcium carbonate to 14 gallons of apple cider. Powdered calcium carbonate (carbonate of lime), commonly called precipi-

DAIRYING.

Care of Cows Before Freshening.

A Few Things You Can Do.

Most of you boys have some care of the cattle, and many of you have a man's share of the dairy work to do. Do you give any extra attention to the cows before freshening? Also, how long do you expect them to be dry As a rule, most good dairymen expect their cows to go dry about four to six weeks before freshening. What is this for? It is only a well earned rest for the cow. If she has produced milk for the past ten and one-half months, it surely seems as though this few weeks' rest were deserved and needed. Sometimes cows are persistent milkers and will give milk right up to the time of freshening, but in such cases it is a good plan to dry them up. About five or six weeks before freshening begin to leave them partly milked, then in a day or two milk once a day, and finally only once in every two or three days. This will usually have the desired effect.

Now, what shall we feed during this dry period just previous to freshening? The cow should be in good order at the time of freshening, so feed her, during the dry period, with this end in view. If she is thin and run-down when she goes dry, feed her a good grain ration besides plenty of hay and silage, or pasture. If, on the other hand, she is in good flesh when she goes dry, clover or alfalfa hay and silage will supply her wants. You can tell best what to feed at this time by paying close attention to the condition of the cow. Let her have plenty of exercise and as calving time approaches see that she receives laxative feeds like bran. This point will take care of itself if the animal is on pasture.

There is a question which sometimes comes up in regard to heavy milking cows. Shall I milk out the animal before calving? No, unless she is an extremely heavy milker, and then only if the udder seems greatly distended with milk. However, if milking is begun before calving it should be continued regularly.

If the cow has been dry five or six weeks, and has been fed so that she is in fairly good flesh, there should be no trouble at calving time. If she is on pasture, leave her there, but be sure to visit her two or three times a day when she is expected to calve. If not on pasture, turn the cow loose in a good sized box stall several days before she is expected to calve. Right here is where every farm boy can do something. See to it that the box stall is absolutely clean, and that the bedding is kept fresh and clean. If some other animal has been sick in the stall, spray it with a 4 per cent solution of carbolic acid or some of the coal tar disinfecting products, before turning cow in. Don't take any chances with disease; keep things clean and airy.

It is a good rule not to interfere at the time of calving unless some accident occurs. Keep away from the cow, and keep away everything which may cause excitement. After calving you may take the calf away at once, or not, just as you wish. At this time the cow should be protected from cold and drafts, so if the weather is severe, cover her with a blanket for two or three days. Let the drinking water be warmed at this time. A light ration of bran mash and as much hay as she will eat readily will do for feed until she begins to recover from the effects of calving. Then gradually increase the ration until she is on full feed again.—Hoard.

When Do Cows on Your Farm Freshen?

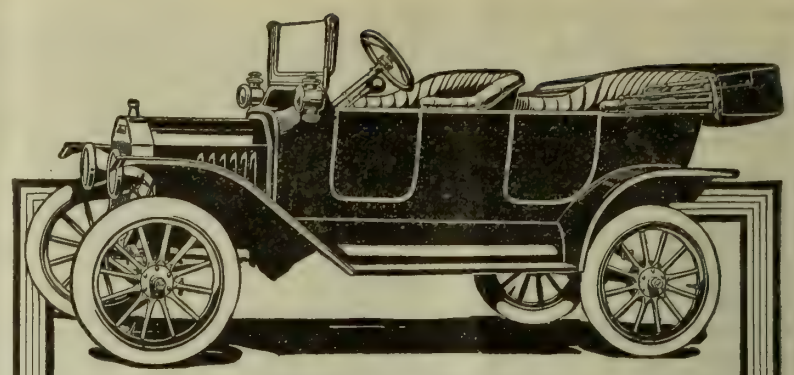
At what time of the year do the cows on your farm freshen? Do they all freshen in the spring, or in the fall? Some of you will answer this question one way and some another, and no doubt there is a reason in either case. But, is it the best reason Of course, the dairyman who retails his produce directly to the consumer must have his cows freshen at various times throughout the year in order to be sure of always having enough milk to supply his customers. But how about the average farmer who sells his milk to the creamery, cheese factory, or condensery? To often most of his cows freshen in the early spring or late winter, milk well during the summer, and are nearly dry when cold weather comes again. As a rule, this practice means a loss of money which is very noticeable because it is unnecessary.

Let's see if there really is a saving when the cattle freshen between October and Decembr. First of all, milk and other dairy products bring a better price during the winter. That being true it means more money for us to have our herd producing the best during the cold weather. In the second place, the average farmer is not so busy in the winter as in the spring and summer, so he can better afford to give more time to his dairy herd. If the cows freshen in late fall and early winter, milking requires less time during the busy fall season. Then, too, cattle which freshen in December keep up a good flow of milk longer, because they are turned out on spring pasture just when they ordinarily would begin to fall off. Nor is that all. Calves born in the winter will get better care for the first two or three months when they need it most. Then when they are turned out to pasture in the spring they are better able to take care of themselves.—Hoard's Dairyman.

Drying Cows.

In well-managed dairies each cow is milked ten months of the year; the remainder of the twelve-months she is said to be "dry." Where the dairyman sells milk to customers he endeavors to have a small part of his herd dry at a time, so that there will always be enough cows to supply his trade. An incidental advantage of this is that the milk from fresh cows is added to that from those more advanced in the milking period, and the changes due to the time of lactation are avoided in the mixed milk, which is thus kept of uniform quality. As the period of lactation progresses there is a tendency to increase in the total solids. Numerous observations have shown that the yield decreases quite steadily from the time the cow is fresh to about the middle of the lactation period, after which it is fairly constant. This shrinkage in yield is accomplished by an increase in the percentage of fat, and the physical condition of the milk is so altered that the cream rises less easily. Discard every cow that goes dry six or eight weeks previous to calving, she should be made dry. She ought to be giving at least 16 lb. a day when starting the drying process. Ten weeks before calving cut off all grain food from the cow, and, if in winter, all roots and succulent food. After a week of this treatment milk her once a day, and another week every other day; then stop. You must stop some time, for if you continue to milk the cow is bound to respond. Sometimes two or three days after stopping if you find the udder caking, milk out a little to ease it, but generally this does not happen. At six weeks or a month before calving she should be thoroughly dry.

Many farmers continue to milk the cow regularly up to within three or four weeks of calving; at this time the cow has, as it were, begun to freshen, and if they stop then trouble ensues, and the udder is likely to be spoiled. If the cow is not dry for four weeks before calving, better keep on milking the rest of the period; but I am satisfied that you can get more pounds of milk from a cow by milking her ten months in a year than by milking her twelve. At the same time, if the cow continues to secrete milk, it must be drawn. None should be forced to go dry against an evident natural resistance to so doing.



"MADE IN CANADA"

Ford Touring Car
Price $530

If you stayed indoors all winter—you might not need your Ford 'till "new grass" time But in the wide "out-of-doors" the Ford serves as well in January as in June. It's the all-year-round car with a reputation for service and economy that isn't affected by the seasons.

The Runabout is now $480; the Town Car $780; f. o b. Ford, Ontario. All cars completely equipped including electric headlights. Equipment does not include speedometer Get particulars from any branch manager, or write Ford Motor Co., Ltd., Ford, Ont.

Renfrew Standard Big 3

Government Inspected. Guaranteed

In your heart, you know that you need a good scale on your farm. You are losing money every month you are without one. Go to our agents in your locality and see the Renfrew Truck Scale—the handiest scale for farm use. Weighs anything from a pound to a ton. Staunchly built. Wheels around like a truck. Stands up in a corner out of the way when not in use. Scale catalog free.

Close Skimming. Self-Oiling.

Government Dairy School records show that the Standard is unbeatable as a close skimmer. Another unbeatable feature is the self-oiling system. This is positively automatic. You simply pour in a certain quantity of oil every three months and the Standard's self-oiling system does the work itself. Every working part receives its share of oil. This means that the Separator runs easy all the time, and no oil is wasted. Other big features explained in our free separator catalog.

Dual Ignition. Extra Large Size.

The Renfrew Standard now has dual ignition as regular equipment. That is, it has a complete high tension magneto ignition system in addition to the batteries. The engine has also been increased in size. The 6 h.p. Renfrew Standard is now almost equal in size to the usual 8 h.p. engines. More weight, more power, more strength, more wear-resistance, more value for your money. Other big features described in our engine catalog—free.

MARITIME BRANCH, SUSSEX, N. B.

What's a Good Cow Worth?

Back in 1878 James L. Cooper of Tennessee paid $300 at auction for the Jersey cow Golden Eye. His neighbors thought he was crazy to pay such a price for a cow. Since then he has never bought another cow, but has raised and registered from this caw and for a number of years the bull calves were killed at birth, while some of the heifers died or were sold to the butcher for some defect.

In 1907 Mr. Cooper had a public sale and sold 100 head, keeping only three or four old cows and 24 calves. He has sold liberally from his herd ever since it was of any size, and since 1907 his sales have been more liberal than before, but he still has 50 head tracing back to Golden Eye.

In writing of his early years at farming, Mr. Cooper says: "I soon discovered that there were much labor and very little profit in simple farming, and getting hold of a few grade cows, commenced selling milk and butter in a very small way at first. The grades served a useful purpose for some years, while waiting upon the slow increase of my registered stock, but I gradually worked them off, and have had none for a long time.

"I built up a good business in milk and butter, and with that and the sale of surplus stock, for my herd finally increased in numbers to the selling point, managed to raise and educate my family, supplying them with all the necessities of life and some of the comforts, and took care of the mortgage. I could not have done it had I depended upon farming alone."

What an inspiring example for a young farmer—buy a first-class female for foundation stock and raise her progeny. Mr. Cooper adds:

"I know of nothing more promising of good results to a young farmer, not afraid of a little work, than breeding registered cattle. My preference is the Jersey always, in connection with the sale of their products."

MONTREAL

Treat Imflamed Udders Promptly.

Garget makes an appearance every once in a while in cows which apparently are in perfect health. The milk in severe cases is either stringy or otherwise altered in character when drawn and collects a yellowish colored sediment on standing. In less pronounced cases there may be little visible change in the milk, but on examination would reveal a large number of germs.

Non-infectious garget is caused by bruises or other injuries, or by a sudden congestion of bolod in the udder as frequently occurs in heavy milkers and in heifers at first calving. Affected animals usually make a complete recovery if given 1½ lbs of Epsom salts and their feed is restricted to that of a succulent nature.

The cause of infectious garget is a germ or germs. When many of them are present in the udder not only is the milk changed, as mentioned above, but the udder itself becomes hot and sensitive to the touch.

The importance of the infectious form of garget rests in the fact that it is usually not easily cured and has a tendency to recur. Furthermore, the disease is easily conveyed to healthy cows through the medium of the milkers' hands or contaminated material of any kind, unless precautions are taken to avoid the transfer of the germs.

Temporary relief may be given by bathing the udder with hot water for one half hour each morning and evening. After thoroughly drying the surface of the udder, warm cottonseed oil should be rubbed in with the palm of the hand.

A complete cure is possible in most cases only by drying the cow off at once so that her system may be free to fight the disease-producing germs that are present in the udder.—F. B. Hadley, in Farm and Dairy.

Just Suits My Needs Building Up the System

This is the Way Thousands of Women are Speaking of Dr. Chase's Nerve Food.

"I want to state that I have never taken anything to do me so much good as Dr. Chase's Nerve Food," writes Mrs. Edson Brock, Trenholmville, Que., "and I am never without it in the house. I was so nervous I could not sleep, but now I sleep soundly at nights and wake up feeling refreshed and ready for the day's work. I used the Nerve Food for months and found that it just suits my needs and has built up the system wonderfully. I know it is Dr. Chase's Nerve Food that has brought about the great change in my condition and am thankful for it.

"My husband was a great sufferer from itching piles and has been entirely cured by Dr. Chase's Cintment."

We are constantly receiving letters like this in regard to Dr. Chase's Nerve Food. Everywhere it is being used because of its great restorative and reconstructive influence on the nervous system. Men and women who are run down in health, tired, nervous and discouraged, find in this great Food Cure the means of nourishing the exhausted system back to health and vigor.

Headaches, indigestion sleeplessness, nervous irritability, lack of energy, and vigor — all tell of nervous exhaustion, and indicate the need of such treatment as Dr. Chase's Nerve Food.

Instead of affording mere temporary relief by stimulating the nerves, Dr. Chase's Nerve Food builds up the system by supplying the ingredients from which Nature forms new rich blood and revitalizes the wasted nervous system. Put Dr. Chase's Nerve Food to the test when you are feeling tired out and discouraged, fill the body with new rich blood and new nerve force and you will realize again the joy of good health. 50 cents a box, 6 for $2.50, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

Boys Raise Baby Beeves.

In Texas They are Revolutionizing the Cattle Industry.

The facts in the following article are taken from "Pigs and Baby Beef" by Stanley Johnson, in a recent issue of the American Magazine. The article in question has been forwarded to the Maritime Farmer for publication by Mr. Robert Hetherington, Cody's, Queens county, N.B., who is interested in the breeding of high class Shorthorns.

"One day in 1912 C. C. French, secretary of the Stock Yards Company of Fort Worth, Tex., said to a cattle man: "There is only one way to save the cattle business, and that is to get the boys and girls interested in it."

"At that time there were slaughtered each year in Texas half a million calves. If they had been saved and fed for a few months they would have been worth 33 million dollars more than they were when killed. The people were killing calves when they ought to be raising "baby beeves," and this was one reason why beef cattle were disappearing and the price of beef advancing.

"Mr. French began organizing baby beef clubs in Texas in 1912. His first call for members brought a response from 500 boys the first year.

Interested the Boys.

In speeches he urged fathers to give their boys a chance to be more than "chore boys," to become farmers in embryo, partners on the ranch. "Every ranchman," he preached, "should get his boys interested in their home life. Give a boy a pig or a calf—and he will want to stay on the farm."

The plan became amazingly popular. The Texas Industrial Congress offered $1,600 in prizes. Ranch owners gave calves to boys, the mayor of Dallas contributed $1,000 for the purchase of pigs and calves; the way was thus cleared to turn stock selling for two million dollars as veal into 35 million dollars as baby beef.

"It became too big a job for its founder, so he drafted Sam Matthews, who, at 15 years old, became an orator as well as a winner of prizes in the great fat cattle show at Fort Worth. Sam became president of all the baby beef clubs of Texas. As the first winner of the state championship, and a state campaigner, young Matthews has become a leader in the affairs of the great state before he is a voter.

Sam advises the boys of Texas to stick to the farm: "I think there is a good future for the boys and girls on the farm," he says, "if we can get it out of their parents' heads that they should not leave to become lawyers, doctors, or governors, or anything along that line.

Boy Gives Advice.

"Give the boy on the farm something to interest him, so that he will become an educated farmer. Send him to an agricultural school, when he is old enough, and not to practice law at the bar."

While Sam at 15 is the dispenser of this sound philosophy, he shows the germ of a good business farmer in the record he submitted with the prize winning call, as a part of the required work of the club.

"I believe in play, he wrote, but the most interesting game I have played is this baby beef production contest. It is interesting because I like to study the laws of nature. I like to feel that I have been able to direct some of the forces of nature in the production of a more perfect animal. I like to win in the contest against you other boys; and, last of all, I like to earn that fifty cents an hour for my work, as I have been able to do this year on my one calf.

I bought one calf for $30 on credit; fed it 150 days at a cost of $23.30 for feed. This was while I was going to high school. Freight to market cost me $3.23. I sold the calf at the age of one year, one month and nineteen days, weighing 1,001 pounds, for $95.09. The net profit was $38.56, besides the $40 prize money. Come in, boys, and join this game, and we shall help to keep down the high cost of living, as well as make some ready cash.

9-Year-Old a Champion.

The winner of Texas baby beef grand championship, this last year, was Howard Hale of Midland, 9 years old. He was given his calf by one of the leading ranchmen of Texas, Henry M. Halff of Midland, who is one of the leading herders of baby beeves, a believer in this movement. Howard Hale came back from the National Feeders' and Breeders' Show at Fort Worth with $180 in money and a $500 silver cup.

The baby beef club idea has spread to other states and the champion baby beef grower of the world is Miss Ada Thames of Covington county, Mississippi, who won her title a year ago in an independent baby beef club, the first of its kind in the state. Miss Thames raised a heifer, "Lady Grace," winning first prize in competition with seventy-five others. When the prize calves were sold at public auction in the county roundup she was offered $395 for "Lady Grace"—and refused to sell. Some day in the near future she will be heard of as a producer of superior stock.

What Baby Beef Is.

Baby beef (to use Mr. French's own words) in a technical sense is not merely young beef. It is a young beef animal from a year to a year and a half old that still retains its baby fat. A calf, with a good supply to begin with, as long as it has milk enough from its mother to satisfy its hunger, retains this fat. If Nature's milk supply falls short and there is no feed to take its place, the calf falls off and the baby fat is consumed to supply the needs of nutrition. This once lost cannot be replaced. The calf may be fed abundantly and get fat again, but the flesh of that animal is never quite the same as it would have been had it not been allowed to become thin. There will never be that fine mingling of lean and fat that makes the highly prized beef. The purpose of the baby beef clubs is not strictly to produce this quality of beef, however, but to feed the calf so that the beef it makes will be of superior quality, and to mature it in the shortest possible time.

Dickie's Miss La Honda Still Going Strong in the Dairy Test.

Arthur E. Dickie, Central Onslow, N.S., writes under date of November 16th: Our Holsteins are looking better than we ever saw them and the cows are doing well at the pail. Miss La Honda, last year's test winner at the Maritime Winter Fair, has done better than 30 lbs. butter in seven days and has been running over 100 lbs. milk per day for a considerable time. Her best day's work so far has been 106 lbs. milk.

Cobequid Helbon Princess made 21½ lbs. butter in 7 days. She has made as high as 76 lbs. milk in one day. She is 4 years old.

Among the young bulls we are now offering for sale are several whose two nearest dams average from 26 to over 32 lbs. butter in 7 days, in official test.

We are having a hard time getting our turnips harvested owing to the continued wet weather.

[Editor's note.—Mr. Dickie keeps a close record of what each and every cow in his herd is doing. He is not afraid to let the readers of The Maritime Farmer know about his cattle and their achievements. He has every reason to be proud of his herd. What is your herd doing? If your cows are doing well at the pail it is good business for you to let prospective buyers know all about it. There are many, many prospective buyers among the readers of the Maritime Farmer. Send along some notes about your stock from time to time for publication in these columns. It will not cost you anything—our readers will be interested and it may be the means of bringing you inquiries and sales for your surplus stock.

MAKES THEM LAY.

International Poultry Food Tonic so stimulates the hen's system that she simply has to lay eggs.

INTERNATIONAL FOOD POULTRY TONIC

MADE IN CANADA

is a mixture of roots, herbs and spices supplying to the fowl elements not contained in the grain feed, and it makes hens lay more eggs by stimulating and strengthening the egg producing organs, as indisputably proven by the sale of over five million boxes. Also keeps poultry healthy and vigorous and makes young chickens grow rapidly.

Its use is cheap, one extra egg in two months will cover its cost for each hen. Its effects are immediately apparent in increased egg production and better health in all the flock.

It is sold in 25c. 50c. and $1.00 packages, under a "spot cash money back" guarantee, by dealers everywhere.

FREE—Write for our free book, the "International Poultry Guide", a complete compendium of poultry knowledge.

INTERNATIONAL STOCK FOOD CO. LIMITED

172 TORONTO, ONTARIO

A Clean Sweep at the Fall Fairs of Quebec and New Brunswick.

Harding Bros., the famous Holstein breeders, of Welsford, N.B., write: Our herd was never in better shape than at present, after two months campaigning at the different exhibitions, where they so successfully carried off the majority of the choicest prizes. At all the Quebec and New Brunswick fall shows, competent judges claimed our herd to be the most uniform herd in type in Canada. The young stuff are mostly all sired by our well and widely known stock bull, Schuling Sir Bosch. Among our big breeding females is Shade Lawn Auling 2nd, a strong, smooth cow weighing close to 1700 lbs. and possessing the very best quality. She has just dropped a beautiful pair of heifer calves and is giving over 80 lbs. milk per day on two milkings a day. She has a sister, Madam Bosch Pauline, owned by the Colony Farm, in British Columbia, that gave 34 lbs. butter in seven days and 1800 lbs. milk in 5 months.

Our Blizzard Schuling Posch, a two year old heifer, was grand champion at Valleyfield, Que., and Three Rivers, Que., as well as winning in the dairy test at Quebec and Sherbrooke. She was also junior champion this fall and last fall as a yearling; she was first wherever shown ever since she was a calf. We have a number of bulls, all ages, for sale, and also some choice females of different ages.

Visitors will be met by appointment and all correspondence will be promptly answered. Local and long distance telephone in the house.

Know the Ailments of your Live Stock.

Times without number stockmen are victims of heavy losses because they do not know how to diagnose even the most common diseases to which their cattle, horses, sheep, swine and poultry are subject. An animal is taken sick and may suffer excruciating pain before a veterinary can be procured. On his arrival the veterinary quickly diagnoses the case, administers a few simple remedies and the animal is relieved and on the road to recovery in a short time. The stockman pays a bill of from $5.00 to $25.00 or more as the case may be and away the veterinary goes. Not infrequently when the veterinary arrives he finds that the animal is too far gone to be able to do anything to save its life, but his

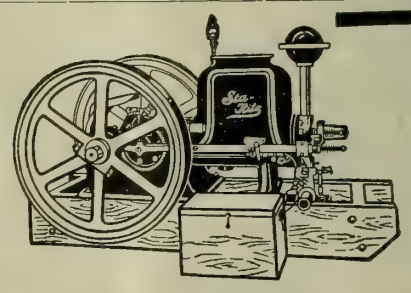
Does it leave any doubt in your mind that a reliable Gas Engine earns its cost over and over and over again? Where would Mr. Porter be without his

EMPIRE "Sta-Rite" ENGINE

W. J. Irwin, of Peterboro', says "it is the simplest engine on the market and with less machinery about it." Just suited to a farmer's needs — pumps water, churns, chops silage—does anything needing power.



Gentlemen—Regarding the Sta-Rite engine I bought from you last October, would say that I am well pleased with the engine.

We run a twenty-two inch buzz saw for sawing poles, and have an old clover huller cylinder with which we shell corn. We shell at the rate of 16 bags of cobs in 13 minutes, and use one quart of gasoline per hour.

We have run a 15-inch blower with three knives on it, to blow our straw into the barn, with a pipe of 14 feet.

We run a 12-inch straw cutter as fast as we can put the straw to it, and it will take a whole sheaf of corn.

We are glad to say it is easy on gasoline.

We also have the engine attached to a post grinder, and grind all our grain.

Very truly yours,
ROBERT PORTER, Ravenwood.

bill must be paid just the same. Then there are sections of country where there is no resident veterinary and it is in sections of this kind that animals suffer the most for lack of a little timely treatment.

Each and every stockman, whether there is a resident veterinary in his district or not, should strive to acquaint himself with the symptoms of and treatment for the most common ailments to which his live stock are subject. It will mean a saving of much money for him. There are some excellent works published on this subject, but the most simple and easily understood that it has been our privilege to peruse is that published by the Veterinary Science Association, London, Ontario. C. M. Robinson, Riverside, Albert Co., N.B., is one of the Association's general agents. You will find his ad on page —— of this issue. Write him if interested.

Dehorning Cattle Should be Done When Very Young.

The question is often asked, "When is the best time to dehorn " It may be said that the work should be done either in the early spring, before the flies and other insects become troublesome, also the warm weather, or else late in the fall after these pests have disappeared. Of course, it should not be too late in the season, as very cold weather in injurious and may cause a cold in the head which will greatly retard the healing process.

The effects of the operation of dehorning vary considerably. We have known large herds of dairy cows to be dehorned and none of the animals fell off in their milk flow for more than a couple of milkings. Again, we have known instances where a majority of the animals would be pretty dull for several days, and, of course, it is true that occasionally an animal will be lost. But this usually happens when a cow is in poor vitality, or when the work is done at an unfavorable season, hence such losses are largely avoidable. The exact loss of flesh or milk due to the excitement loss of blood and pain cannot be estimated, as very much depends upon the skill of the operator, and perhaps more still upon the temperament of the animal operated upon; nervous, irritable animals suffer a greater setback than the quiet, sluggish ones.

Some animals bleed severely. To prevent this, wind a piece of strong twine firmly around the head just below the horn bases so as not to interfere with the operation. Then tighten the twine by drawing together the upper and lower strands midway between the horns and fasten with a knot. Twine put on in this manner presses firmly against the large arteries. In a few hours the twine may be removed, when danger from bleeding will have passed. After dehorning the cattle may be turned into the pasture or corral, but they should not be permitted to rub against any hay or straw stacks until the wounds have healed, as chaff in the openings may cause considerable trouble.

Several different kinds of instruments have been invented with a view to accomplishing the operation with as little pain as possible to the animal. The dehorning saw was among the first to appear. This instrument is still used in many cases, but while it does the work required of it, it will always seem to be unduly cruel. The clipping dehorners are now employed extensively, as they cut the horns off in a fraction of the time required by the saw, and the pain is reduced to the minimum. The saw, as a rule, makes the neater job; occasionally clippers crush the bones, causing a slow healing. Unless the horns are taken off very close they bleed badly an dstubs grow. Care should therefore be exercised to do the job thoroughly. The cut should take about one-sixth of an inch of the skin around the base of the horn and should be slanted, with the natural slope of the head.

If one has a great amount of dehorning to do, he should equip himself with a dehorning chute, in which the animals may be driven, one at a time, and the operation be performed with less labor, and in a much shorter space of time.

It is to be hoped that in time less and less dehorning of the kind we have discussed will need to be done and that the dehorning of the future will be more generally done before the horns have grown to be more than tiny buttons on the head of the calf, at which time they are readily and almost painlessly removed by touching with a stick of caustic potash. The action of this agent when properly used is to destroy the life of the horn in its early stage, rendering the treated animal a smooth headed beast.

Dehorning by potash is done before the calf is ten days old or as soon as the embryo horns can be located on the calf's poll. The hair surorunding the horns should be clipped off and the parts moistened with warm water. When using the potash in the stick form it should be wrapped in paper to protect the hand and an exposed end moistened and rubbed gently on the buttons in turn for about five minutes, or until they become sensitive and red, but not to the extent of bleeding. Care must be taken that the dissolved potash does not run down the side of the head, or the skull may be permanently disfigured. The calf should be kept from getting wet for a few days following treatment so that the dissolved potash will not run down. Treated calves should also be kept separately so that they can not lick each other. The calf will suffer some pain for an hour or two, but no other inconvenience is experienced. If the work is carefully one a scab soon forms, healing follows and the spots become covered with hair from the surrounding parts.—W. F. Purdue.

Ewes on Turnips.

It has passed into a proverb that a good turnip year means a bad lambing year, but there are still some who pooh-pooh the idea of any mischief being likely to result from an unrestricted diet of swedes for pregnant ewes. The season has come when the feeding of the swedes will be commenced—in many cases before they are ripe—and perhaps it may be useful to warn farmers once more against their unrestricted use for in-lamb ewes. I cannot pretend to say why it is that almost exclusive root-feeding can, sometimes for several years, be practised with immunity, but undoubtedly such cases occur, and it is these cases that cause carelessness of confidence in others; but this much is certain, sooner or later, there comes a rude awakening, and it has to be admitted that there is danger in heavy root-feeding during gestation, and especially so when ewes have been flushed on highly nutritious food at conception. It is conceivable that during the period of gestation, a moderate allowance of roots, especially combined with some dry and more nitrogenous material, will save many ewes from becoming poor and aeaemic, as they often do when the weather and disease-producing agencies have ruined the turnip crop, but any quantity of roots alone, at the gestation or any other period, is more likely to increase than relieve an anaemic tendency. Anaemia is caused by the unlimited ingestion of food grown with an excess of phosphates and surcharged with water. The final stage of this sickness is nothing more than dropsy.

Heavy root-feeding without compensating dry matter results in gradual but steady emaciation, and where in addition there have been the demands on the system of intra-uterine life, succeeded by the weakening effects of lactation, many ewes die of anaemia. They become "poked," as the oedematous swelling under the jaw is called, and the visible mucous membranes have the blanched appearance resembling that seen in "rot"—in fact, the condition is practically the same, except that it arises from a different cause. There is abundance of evidence of bad lambing-times being distinctly tracable to the exclusive use of roots in seasons when roots are unusually abundant, and, as the owner often says, he does not know what to do with them. Better let them rot or return them to the ground as manure, than to trust the in-lamb ewes with them.

Lack of Exercise

In the case of pregnant ewes the mischief is not confined to the effects on the system of an enormous quantity of watery food. There is also that arising out of the lack of exercise associated with constantly folding on roots. Exercise is absolutely essential to the health of the in-lamb ewe, and to the proper development of the foetus. To a limited extent this is recognized, and an endeavor is made to provide for it by removing the ewes from the fold during the day and returning them again some time before sundown. But the animals do not keep moving about in the pastures as is their wont when grazing. Often there is little enough there for them to eat, and, anyway, they soon seem to acquire the knowledge that in a short time they will be taken again to the roots left in the morning. Thus they lie about until this time arrives, when, with appetites quickened by their self-imposed fast, they have another gorge. Look, too, at the state of the fold in wet weather on the heavier kinds of land. Are they fit for animals heavy in-lamb to spend 18 or 20 hours in? In the interest of economy, or of the succeeding crop, it is considered essential that the roots should be consumed on the ground, if the sheep are kept as muck-distributors, well and good, but there ought to be no surprise if breeding operations are not attended with any great measure of success, and if dead or "dropsy" lambs are produced and some ewes die at or soon after parturition.

"Bursting" the Ewes

Sometimes this actually happens, and rupture of the muscular walls of the abdomen occurs. The manner in which this result is reached is purely, or nearly purely, mechanical. The ewes thus affected are usually those with twins or triplets. As gestation advances, the weight and bulk of the gravid uterus, added to the large quantities of innutritious food with which the stomach is kept filled, proves too much for the resisting power of the abdominal walls. This same distention of the digestice organs with a material considerably below the normal temperature of the animal body, and the accompanying pressure upon the gravid uterus, is also productive of arrest in foetal development, and the occurrence of premature births and the production of dead lambs. Against a moderate allowance of roots, with a sufficiency of dry food, nothing can be said, but the temptation to use them freely, because they are abundant and the grower hardly knows how to dispose of them, needs to be resisted.—Veteran.

THE HORSE

Shoulder-Slip or Wasted Shoulder.

Shoulder lameness affects principally only a certain class of horse, working under peculiar conditions, viz.: young horses that have been plough ing. It is called "shoulder-slip" because of a peculiar outward slipping movement of the shoulder joint at each step the animal takes. It appears almost that the shoulder is out of joint, but this is not the case, and the peculiar "slipping" movement can be explained by a consideration of the anatomy of the part. It is called "wasting," because the ultimate effect of the sprain and consequent inflammation is atrophy, and where there was previously a fullness there appears a distinct hollow, this going on in extreme cases until the shoulder-blade appears covered only with skin, and the spinous process becomes distinctly visible. This term is, however, applied indifferently to any case of atrophy, and as wasting of the shoulder muscles is a common result of all long-standing and severe lameness entailing disease of the limb, it is of very little value as expressing the form of injury under consideration.

In the first stage the lameness may not be very severe, and there is little or nothing to see, because the atrophy of the muscles is an after effect, and very often only apparent after a considerable interval has elapsed after the strain.

Sprain of the muscles outside the shoulder blade may occur from unexpectedly stepping into a hole, and hunters may meet with such accidents among rabbit burrows, but it occurs mainly in young horses when first put to plough. It is seldom that older horses suffer, as they have become used to the work, are generally in harder condition, and are able to avoid injury themselves.

The usual symptoms are swelling and heat over the course of the muscles, upon the outer surface of the shoulder blade, and in the joint itself. If only one shoulder is affected, something may be learned by a careful comparison with its fellow, but sometimes both are injured. The horse may progress without much apparent lameness, but by standing directly in front of him the affected shoulder will be seen to roll outwards from the body to a greater extent than the sound one. giving rise to the characteristic gait already described, and from which the lameness takes its name. In the majority of cases actual lameness does not occur until the muscles have become atrophied, and instead of swelling there is a wasting of the shoulder. This does not take very long to come about, and a well-developed atrophy may occur in the course of three weeks after a sound horse has been put to work. This is much more rapid than where atrophy arises from diseases of the limb from lameness in the foot or elsewhere. When wasting has taken place there will be a hollow space upon either side of the scapular spine, the process being thus rendered prominent and standing out as a sharp ridge. The only way to prevent shoulder-sprain in young horses is to bring them gradually to work, to avoid working them in company with animals that will outpace and fatigue them, and to keep animals intended for hunters or cariage work at some other occupation than ploughing. If young horses do short turns until they get into hard condition, and used to the work, the risk is reduced to a minimum, especially if they work in company with old, steady horses. When a colt becomes fatigued he loses command over his actions, becomes unsteady in his gait, and thus liable to sprain himself.

Even badly-wasted shoulders are curable, unless degenerative changes have taken place and the parts have become organically altered. It may take months to refill the hollows on each side of the scapular spine, but in any recent case perseverence will meet with its reward. The first step is to rest and to reduce inflammation. The amateur and domestic treatment of sprain of the shoulder is often as bad as it can be, because of the foolish plan of at once resorting to an embrocation, and this applies with equal force to all sprains, whether of muscles or tendons. Stimulating liniments, blistering agents, and "oils" should never be applied to a recent sprain, or to any structure in which acute inflammation exists, but this should be first reduced by rest, fomentation and medicine. Exercise is often given under the mistaken notion that it will work off the stiffness, but, in the first stage at least, rest is very essential, and even voluntary movement, such as the horse makes when turned out to grass, in walking for a living, is to be discouraged. A good loose box, bedded with moss litter, sawdust, or cut straw, in which the horse is less likely to catch his toes than in the deep bed of long litter, should be provided, and the shoes removed. It may even be useful to replace the shoe ordinarily worn by one with a high heel, as this enables the animal to rest the parts better by standing with the injured muscles in a state of relaxation or repose. A dose of physic may be usefully given, especially if the horse is in a plethoric condition, and for the same reason the diet should be light, and the corn dropped out of the ration. The part is an awkward one to foment. and this operation is rarely carried out in a satisfactory manner by attendants, whose idea of a fomentation is dabbing about with half a bucket of lukewarm water, most of which is spilled on the ground. It is best to begin and keep on with cold water, and the easiest way to apply it is to hang a rug over the shoulder, securing it round the chest and neck, and keep the blanket wet by frequently ladling water between it the the skin with a cup or small pot. After the heat and tenderness have subsided, or the muscles have begun to waste, the repeated applications of moderate stimulating remedies, such as mild blisters, and such exercise as is obtainable in a good level pasture, are indicated. Between the intervals of blistering, or when a stimulating liniment is used, some recommend light work at a walking pace, as being calculated to develop and give tone to the atrophied muscles. Massage and galvanism are preferred by some to active stimulation. The cases that do not yield to treatment are those in which the tendons of the muscles, the rim of the gelnoid cavity of the scapula, or the external trochanter of the humerus have become organically altered in structure.

Horses that have recovered from shoulder-slip should never be put to the plough again. It is very desirable to be able to differentiate between wasted shoulder from spraing and that kind of wasting associated with chronic foot lameness, and resulting from long disuse, because a horse with a wasted shoulder from sprain may prove a useful purchase, and by time and judicious treatment come round, but the other kind of wasting would prove a bad bargain.—Veteran.

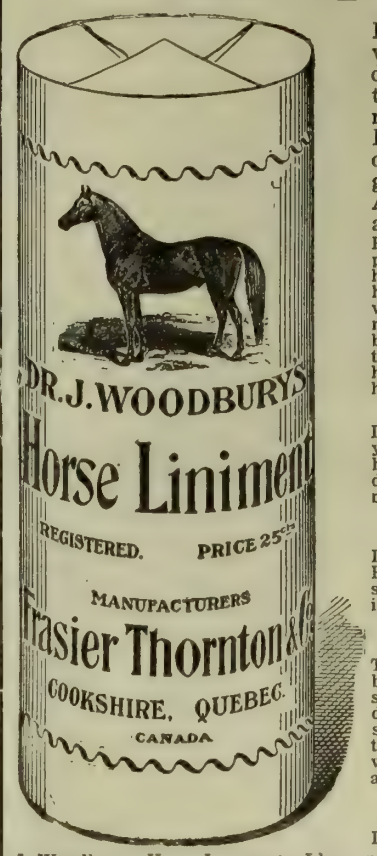
Dr. J. Woodbury's Horse Liniment

INFALLIBLY THE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale, N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.
Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.
Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

True and False Economy in Feeding.

It has often been pointed out in these columns that there is danger of the farmer parting with his saleable hay and endeavoring to maintain his own horses on inferior rubbish, or to substitute straw or worse material in large part for the hay sold off. It is no economy to sell hay and so to feed the team that efficient work is not obtained, or so that the horses become affected in their wind, or suffer from colic and other digestive derangements. At the same time both the seller and buyer of hay might well economize by using more grain than they usually do. Farm horses get a good deal more hay than is necessary or desirable, with an allowance of grain in inverse proportion. During the summer, when green meat is plentiful, the carter is permitted to put his scythe as deeply as he likes into the "seeds," trifolium or tares, and to regale his charges with vast pitches of this sometimes succulent and sometimes over-ripe material, and at other seasons he has a free run to the "seed" stack, as clover-hay is commonly called, while at the same time the "pilkings," or thin, hungry oats, are carefully doled out to him. Hay in such enormous quantities is not necessary nor desirable, having regard to the cost of production, nor is it a cheap food, even when plentiful, having regard to the quality of the work obtained. When hay is dear, money would be better spent in oats and beans. It may be necessary when hay is inferior to provide the horse with large quantities from which to extract the essential nutriment for his maintenance, but it only puts a heavy strain on the digestive organs, causes colic and broken-wind, and is anything but economical in the end.

For all horses a certain amount of bulk is necessary, and hay, or hay and straw chaff, cannot be dispense with entirely, but the actual quantity required is much less than that generally given. To the horse at fast or hard work it will be a great advantage to have more oats and less hay, while more grain would undoubtedly tend to increase the working capacity of the average farm team. Straw should by no means be entirely neglected as a substitute for hay. At all times horses doing slow work can have a proportion of well-saved straw cut with their chaff and be none the worse for it; but, as a rule, this proportion cannot safely exceed one part of straw to two parts of hay without taxing the digestive organs, and half and half should be an outside limit for even horses at slow work receiving a fair grain allowance. It must always be remembered that against any saving by the use of inferior or unsuitable food for animals there may have to be put a veterinary surgeon's account for attendance and medicines, loss of men's time in nursing and watching, and loss of the services of the horse. It does not take many veterinary visits to equal the price of a quarter of oats, or a long case to cut deeply into a ton of hay. Taken all round, and over any extended period, doubtful feeding experiments rarely pay in the end, and the most that can be said, in the majority of cases, is that the animals survive, generally at some sacrifice of efficiency. The country practitioner is frequently called upon to attend cases of indiges-

tion brought on by a too free use of straw as a substitute for hay. The chaff in many instances consisted almost entirely of straw, sometimes of wheat "cavings," and very often the hay supplied was inferior as well as small in quantity. Hard, flinty wheat straw, full of harder "knots" or joints, is more than the average horse can digest, when it is used as a "fill-belly." When taken in good time, properly treated, and an alteration made in the diet, recovery from attacks of "straw colic" is the rule, but still many horses die of this distressing equine complaint.—Veteran in Farm and Home, England.

Health of Animals.

The recently issued report of the Veterinary Director General (F. Torrance, B.A., D.V.S.) is a comprehensive document an done worthy of extensive public reading. There is no branch of agriculture of more universal importance than the health of food-producing and utility animals. Dr. Torrance goes fully itno the activities of his branch. "In some directions," he says, "such as the control of glanders and of mange, much progress has been made; the country has been protected against invasion by diseases foreign to it; additional facts have been brought to light by the members of the branch engaged in scientific research, and there has been a marked advance in the division entrusted with the inspection of meat and canned foods." On the other hand, the Veterinary Director General continues, "I have to report a serious outbreak of dourine in the Province of Alberta and continued losses from hog cholera."

Regarding glanders, it was found necessary to slaughter only 353 horses in 1914 as compared with 638 in 1913. In combating hog cholera 9,900 hogs were slaughtered in 1914 at a cost of $61,588.44 in compensation. The figures in the latter instance present a formidable aspect, but, as Dr. Torrance remarks, "As the hog population of Canada is approximately 8,000,000 the loss of even 10,000 is not high." He adds that the disease rarely breaks out a second time on premises where it has been extirpated, that the feeding of uncooked garbage to hogs continues to be often the cause of the initial outbreak, and that the neglect of owners to notify the department of the appearance of the disease is chiefly responsible for its spread. The last remark applies to the initiatory manifestation of all other infectious or contagious diseases. The war against tuberculosis continues with unremitting vigor.

The research and experiments carried on at the different official laboratories is described, and statistical tables given of results, and of the inspection of animals imported and exported and of packing establishments and abattoirs. Import inspections from the United States and Newfoundland in the year ending March 31st, 1914, totalled 29,726 horses, 1,641 mules, 14,747 cattle, 2,3,332 sheep, 374 swine, 822 goats, 22 asses, 8 elk and 5 elephants.

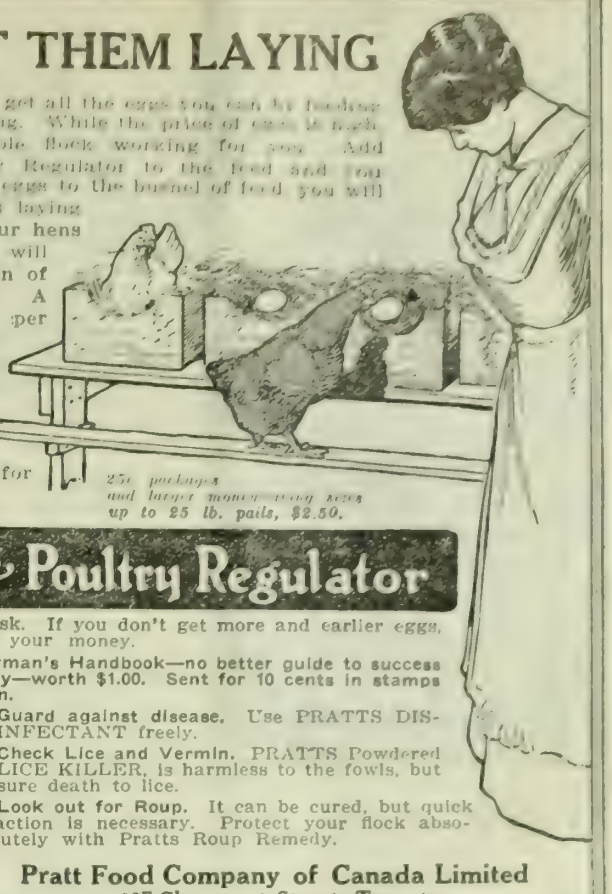
Some two dozen contributions from the chiefs of divisions stationed at different points—inspectors, pathologists, biological experts and superintendents of quarantine stations—with a number of illustrations of animals variously infected, combine to make a most useful and widely interesting report, which can be had free on application to the Publications Branch, Department of Agriculture, Ottawa.

How to Drench a Horse.

The right way to drench a horse is as follows: Back him into a stall; then he cannot back away. Put a running noose in a soft half-inch rope, and place the noose around the upper incisor (pincher) teeth, just inside of the upper lip. Have the knot of the rope come directly in the middle of the front of the upper jaw. Throw the free end of the rope over a beam well above the horse's head. Raise the head and hold it there with the noose and rope. Get the head high enough to prevent medicine from running out of the mouth, but do not put it up so high that the horse will be unable to swallow comfortably. Stand on a chair or box, so that the right hand holding the bottle may insert the neck of the bottle into the right side of the mouth. Then pour in a couple of ounces of medicine, and let the horse swallow that before more is given. Do not grasp and squeeze the horse's throat. This makes it difficult or impossible for him to swallow. Tickle the roof of the mouth with the neck of the bottle or fingers, and swallowing usually follows at once.—New Zealand Farmer."

START THEM LAYING

From now on, get all the eggs you can by feeding for heavy laying. While the price of eggs is high keep the whole flock working for you. Add Pratts Poultry Regulator to the feed and you will get more eggs to the bushel of feed you will get your birds laying earlier and your hens and pullets will stand the strain of heavy feeding. A cent a hen per month will keep them laying through the winter months—a small price to pay for success.



25c packages and larger money-saving sizes up to 25 lb. pails, $2.50.

Pratts Poultry Regulator

Try it at our risk. If you don't get more and earlier eggs, we will refund your money.

160-page Poultryman's Handbook—no better guide to success in raising poultry—worth $1.00. Sent for 10 cents in stamps or coin.

Guard against disease. Use PRATTS DISINFECTANT freely.

Check Lice and Vermin. PRATTS Powdered LICE KILLER, is harmless to the fowls, but sure death to lice.

Look out for Roup. It can be cured, but quick action is necessary. Protect your flock absolutely with Pratts Roup Remedy.

Pratt Food Company of Canada Limited

ESTABLISHED 64 YEARS

2000 POUNDS OUR LEADER

POULTRY

Under no Condition Should Pullets be Sold as Market Poultry.

Comparing the poultry situation this fall with that of a year ago, we find conditions almost the reverse of those last year. Poultry of all classes was plentiful a year ago, and today there is a scarcity in all lines. Last year prices were low and feed was high and scarce, but this year feed is plentiful and cheap and the price of market poultry is extremely high. It is unfortunate that we should be confronted this year with such conditions because this year, of all years, poultry raising is a paying branch of farm work. With feed so cheap and chickens selling as high as 35 cents a pound for Thanksgiving trade and turkeys the same price, we can readily see where our farmers made the mistake of cutting down their poultry production rather than increasing it.

Winter Eggs Scarce

If this condition would only affect the dressed poultry trade it would not be so bad, but it does not stop with that. A scarcity of market poultry always means a scarcity of winter eggs. The supply of market poultry and that of winter eggs go hand in hand. If we cut down on the number of chickens raised, we are cutting down the number of winter eggs produced, for on the pullets will depend the supply of winter eggs. The rule in rearing chickens is that the chicks hatch about half and half, cockerels and pullets. Hence, if we cut down the hatching in the spring so as not to have so many chickens to sell in the fall, we necessarily cut down the supply of pullets as well.

With markets such as we have in this country it seems too bad that our farmers should have lost sight of the opportunities presented in poultry raising. Of course, wheat stands out as the thing in this country, and a flock of fifty hens looks pretty small beside an acre of wheat, but if we stop to consider which of the two is the biggest gamble we certainly must say that it is wheat. The returns from the poultry yard naturally come in small quantities, but then they are sure, for the prices are always such that there is at least a little profit in it. Last year was an exceptional year and poultry was away down in price, wtih the result that the poor man's table had chicken on it—poultry meat being cheaper than all others. The conserving public took to eating chicken on a larger scale than ever before and comparatively small quantities were carried over in cold storage. This finds us now with hardly any storage poultry on the market and also a shortage in this year's supply and high prices are the only possible result. On the Saturday before Thanksgiving turkeys were selling on the Winnipeg markets at 32 cents to 35 cents per pound for fresh killed stuff, and storage turkeys were selling at 30 to 32 cents per pound. Chickens were all the way from 28 to 35 cents per pound, the former price being for ordinary stuff and the latter for choice milk fed, crate fattened roosters. These prices were too high for the ordinary man to have any poultry at all for his Thanksgiving dinner, but with the shortage the prices were bound to go up. In conversation with one dealer he remarked: "We ourselves are to blame for these high prices because we simply put the farmers out of the business last year by cutting down the prices so hard that they saw it was not paying them, but this year we pay for it. Today, with poultry selling at these high prices, one pound spoiling on us, represents the profit on one carcass. Last year, wtih cheap poultry, the losses were not nearly so heavy on account of the price being so low."

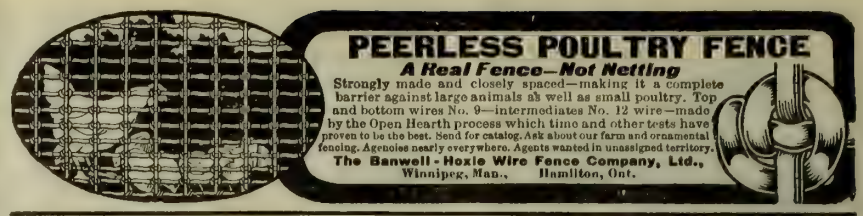
Raise More and Better Poultry.

Already dealers are beginning to look up Eastern conditions to ascertain if they can get their supply of Christmas turkeys there since there are not sufficient in this country this year to supply our own home demand. In view of these facts we urge our farmers to go in for better poultry and more of it another season. With a gradual change to better marketing facilities and an unlimited market demand for home grown products, our farmers would do well to keep their finger on the pulse of their own home trade. They can pretty well tell the condition of the markets one year with another and even if prices are low for the general run of stock, there is always a good price maintained for a well finished and properly prepared product. The only thing to do under adverse conditions is to try and put up a better class article than the ordinary and then secure a better price.

Referring to our Western egg trade I might say a few things which may not sound very good to some of our farmers. Our eggs have quite a reputation already not for their high quality, but rather for lack of quality. The Western egg is without doubt the poorest egg on our Canadian market today and just now, when our eggs should be making a name for themselves in the East and in the Old Country, we must have dealers coming in here and telling us that our eggs are a disgrace to the Canadian egg trade and out of all the eggs in cold storage in two of our cities, they could not find a single carload of really high quality eggs. This is due, to a large extent, to our farmers not knowing how to produce good eggs and also not knowing how to handle them properly. Probably ninety-five per cent. of the population of our cities who are buying eggs from the retail stores depend altogether on the storage eggs.

In view of these facts the only conclusion we can come to is that the price of winter eggs is going to be very high if not higher than ever before. The supply of pullets is low, therefore the supply of winter eggs will be low. It is now too late in the season to start over again, so the farmers must make the most out of what they have. Under no conditions should pullets be sold as market poultry. We again urge the importance of this point. Take what pullets you have now and give them proper feed and care if you wish to get winter eggs. High class new laid eggs are selling now as high as 40 to 45 cents a dozen, with the summer hardly over and judging by the market demands there will be a steady climb from now till the beginning of the new year.

There is no danger of over-doing winter egg production and our farmers can double their flocks of pullets next year without the least danger of over crowding the market. Summer eggs will, of course, be low in price, but even those eggs, if of good quality, will bring a price that will make egg production pay. The West simply has to come round to the point of producing a better class of eggs. Eastern dealers want good eggs and we have in them an unlimited market demand for this class of goods. Just a few days ago another Eastern dealer wanted to buy up a quantity of eggs but he did not dare touch them. He was positively disgusted with the class of eggs we have here in the West. Let us get ready for meeting the demands of the Eastern markets and put forth our best efforts from now on to produce eggs that are second to none on our Canadian markets.—By M. C. Herner, Professor of Poultry Husbandry, Manitoba Agricultural College.



PEERLESS POULTRY FENCE
A Real Fence—Not Netting
Strongly made and closely spaced—making it a complete barrier against large animals as well as small poultry. Top and bottom wires No. 9—intermediates No. 12 wire—made by the Open Hearth process which time and other tests have proven to be the best. Send for catalog. Ask about our farm and ornamental fencing. Agencies nearly everywhere. Agents wanted in unassigned territory.

Winnipeg, Man., Hamilton, Ont.

Laying Pullets.

(Taken from a Sagadahoc county poultry demonstration, and from the office of the county agent, H. J. Shaw, Topsham.)

One of the most common questions among poultry raisers is, Shall I keep my yearling hens over, or raise pullets for winter layers?

It is, of course, the plan of most people to have their poultry laying from October until March; the reason for this is the high price of eggs. This is undoubtedly the most profitable time for egg production, as the price ranges from 35 to 60 cents per dozen.

A reasonable comparison of the two ages for egg production is as follows: A healthy and well-developed pullet (and of course it is understood that only birds of good constitution and health should ever be put into a laying pen) will demand, if from a good laying strain, the price of $1.25 each by the first of October. Figuring with this price as the initial cost, a pullet starting to lay the first of November, with the average price of eggs at 48 cents per dozen, will have to lay 42 eggs to pay the first cost. A well-bred pullet wil ordinarily lay as often as every other day; therefore, 82 days, or less than three months, laying, will pay the bill. The results of nine months of off-and-on work and the value of the meat the end of the year is now left to pay the keeping costs, such as feed, labor, interest, cost of housing, and profit.

With a yearling fowl, after a summer of good work, when prices are only fair, they will go into the molting stages. This period of molting will vary with individuals, but will usually commence along in June or July, and last for a period of four months. Most hens will lay more or less eggs during the early stages of this molt, while the feathers are dropping fast, and the new ones growing slowly, but nearly all stops when the feathers are growing rapidly. This period of molt and work of growing the new feathers will run along late into the fall, the time for which they should be preparing themselves for winter laying. With these conditions it cannot help cutting down the winter egg laying, as you will notice in

This perfected Union Suit is ideal for ladies
Its glove-like fit is permanent because knitted in during the making, and because the fabric will neither lose its shape nor shrink.
Its soft, comfortable smoothness is due to fine quality yarns and the even texture of the Spring Needle fabric.
Watson's Union Suits for ladies are made with the Klosed Krotch as shown —a feature of real lasting comfort.
If you prefer other styles, your dealer has them in Watson's—including Vests, Drawers, Corset Covers, Black Tights, Etc.

the following table. It is possible by heavy feeding to encourage the hens to lay more eggs during the early stages of the molt, and also to put them into better condition for market at the time they stop laying.

This proposition of forcing the yearlings for eggs and meat producion during the first stages of molt, then marketing at the proper time according to market conditions, and then having a flock of well-bred, early-matured pullets to take their place as winter layers, is supported by the following table from the egg-record sheets of A. H. Donnell of West Bath, a Sagadahoc county poultry demonstrator.

These yearling hens did a fine summer's work and were in good condition in the fall, but owing to the quarantine on live poultry they were not marketed, nad, therefore, reveal the following figures, which I consider of great value:

Comparison of Winter Egg Production, November 1 to April 1.

PRODUCTION

	Hens (225)	Pullets (225)
November	383	757
December	624	1273
January	1034	1442
February	1344	2319
March	2839	3709
	6204	9500

Value of Eggs

Hens	Pullets	Adv. of Pullets
$15.68	$30.87	$15.19
24.96	48.96	24.00
26.71	37.25	10.54
31.36	54.11	22.75
65.00	77.25	22.25
$153.71	$248.44	$94.73

These figures are authentic, being taken from the pen egg-record sheets and compiled by the agent personally. —Maine Farmer.

For Laying Hens.

The feeding formulas that appear at the bottom of this column are being employed in the fifth laying contest now in progress. By simply varying the proportion of grain to mash, it is believed that these rations can be easily adapted to a number of different breeds. During the first two years the grain ration was fed in a well known automatic feeder which was open a part or nearly all day depending somewhat on daily climatic conditions, but largely on the season. While the hoppers gave fair satisfaction, the management of the contest feels that an experienced man always on the job is able to keep in closer touch with the birds and get better results by hand feeding and in consequence the latter practice is now being followed. During the greater part of the year, the principal feed is given about four o'clock in the afternoon but in winter one or more light feeds should be given in the morning to induce exercise. Dry mash is kept before the birds at all times in earthenware hoppers which are supplied with a wire grate to prevent the feed from being scratched out and wasted. It will be noted from the mash formula below that both fish and beef scrap are used; if either is omitted the other should be doubled. If sour milk can be supplied abundantly, the meat part of the ration may well be reduced by one-half or more. Grit, shell, and charcoal are supplied freely in rectangular boxes with three compartments each containing about a quart. Green food during the winter consists principally of mangel beets fed daily; in summer, the birds have grass runs. Rape and Swiss chard are grown to supplement the summer supply of natural green food.

Dry Mash

Wheat Bran	100 pounds
Corn Meal	100 pounds
Ground Oats	100 pounds
Flour Middlings	100 pounds
Fish Scrap	50 pounds
Beef Scrap	50 pounds

Scratch Grain.

Wheat	100 pounds
Cracked corn	100 pounds

Dust Baths.

Laying hens must have their morning dust bath if they are to lay the maximum number of eggs through the winter. It is a necessary luxury for them. By its use they are enabled to rid themselves of mites and to remove all scales and dirt from the skin.

Lice and mites do their greatest injury to the fowls at night while on the roost. Instinctively they look for a place to dust in the morning. Do not force your hens to dust in the dropping or feed litter. During the summer they will usually find their own dusting place such as the road or in the shade of trees and shrubbery, but in the winter it must be provided for them. Nail an old grocery box in one corner of the house. Elevate it above the floor so that it will not get filled with straw or litter and put in six or eight inches of dusting material. During moderate weather their box may be placed out in the pen.

To be effective the dusting material must be very light and dry, and fine enough to fill the breathing pores of the mites and lice. The finer the better.

A good dusting material is composed of equal parts of fine sand, road dust, and sifted coal ashes. A cupful of kerosene and a handful of sulphur thoroughly mixed with the dust will make the dust bath still more effective.—C. S. Anderson, Colorado Agricultural College, Fort Collins, Colorado.

Forcing Late Pullets.

Are your pullets laying? Pullets that do not begin to lay by the time freezing weather sets in will usually wait until spring. This means a dead loss for several months. The average poultryman cannot afford this loss if he is raising poultry for egg production.

Pullets of the Mediterranean breeds hatched not later than May 1st, and that have been reasonably well cared for during the growing period will be laying before early winter.

It sometimes happens that force of circumstances necessitate late hatching and it is these pullets that must be pushed along to get them ready to lay in the fall.

Feed a ration of high protein content including such feed as beef scrap, bran, middlings and oil meal. If skimmed or buttermilk is available, it will be of value. Give the birds free range whenever it is possible If they must be confined supplement their ration with some green feed such as sprouted oats, green alfalfa, beets, cabbage, etc. Birds fed such feeds as above, kept free from disease, lice and mites, and given plenty of exercise will develop amazingly.

There is still some time before severe winter weather. Try forcing your late pullets and see the effect it will have on the winter egg basket.

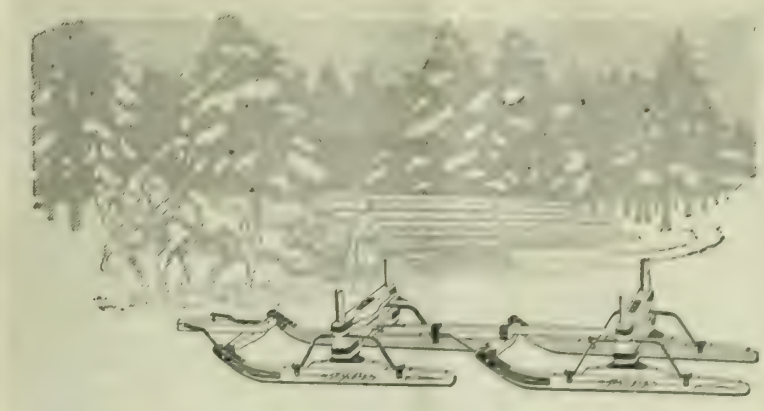
Great Britain Out for Canadian Eggs.

Increased receipts and increased exports of eggs are reported on the Montreal market during the past week, as compared with the same week last year. No special change took place in regard to prices, though the falling off in strictly new-laid eggs sent the price up in that case. The same condition as regards strictly fresh eggs, applies to Boston market, the difference being that there is absolutely no export enquiry whatever, as compared with splendid possibilities for export from Canada to Great Britain. Montreal is advised from both Glasgow and London that considerable shipments of Canadian eggs will be required over there. The advice includes the caution that prices that are prohibitive will lose the trade entirely, this being worth the consideration of all shippers, and, running parallel as it does with the refusal of the British to accept Danish butter at demanded prices indicates that so far and no farther will the heavily war-taxed consumers of Great Britain go for their food requirements. The British demand is being encouraged by the Canadian government with the aim in view of making Canada the Mother Country's chief egg producer. British imports are now greatly above last year, but by a long way yet back to their proportions of 1913.

The Nest Boxes.

A matter requiring careful attention, but which is frequently overlooked is the nest boxes. These are best made of bottomless boxes, about fifteen inches square and eighteen inches high, standing upon a shelf a few inches above the ground. Fixed nest boxes should never be employed, as they are so difficult to clean, and if the greatest care is not exercised, will harbor vermin and the like. They should be a few inches from the ground, because when on the floor there is a danger of the hens eating or the rats removing the eggs. There should always be a sufficient number as when too few are supplied the hens lay about the house, and in this way the vice of egg-eating is encouraged. The nest boxes should be placed in the darkest part of the house, preferably below the window, as the less the birds are disturbed while laying the better. More than this, if facing the door or the window, it would mean that during hot weather the sun would shine directly on the eggs, possibly starting the germ into activity, at any rate doing the eggs no good. Straw is the best material with which to litter out the nests, and oat straw is better than either wheat or barley, being more pliable. Hay is not so suitable as straw, as it is a retainer of heat, and becomes foul sooner than the latter.—Middlesex.

Pullets should start to lay before the cold weather and they should be in their winter quarters several weeks before they begin to lay. Get their house ready early in October, sort out the early pulets and put them in by the middle of October at the latest. It is the early eggs that pay, and if pullets do not begin to lay before December they will not likely start till near February.



Winter Hauling Made Easy

FOR the use of our customers whose hauling cannot be stopped by the snows of winter, or to whom the snows are welcome, as furnishing a smooth hard road over which to move their products, we offer a line of bob sleighs so complete that each man may find in it the kind of sleigh he needs and uses.

Unless a sleigh will stand hard knocks, it is of little value in Canada. Therefore, we make these sleighs, above all else, strong. Even the lightest one-horse sleighs are as strong as selected pieces of high-grade wood and steel and the most careful workmanship can make them. No imperfect or unsound material finds its way into the manufacture of these goods.

Each sleigh we sell is guaranteed, with fair usage, to carry its load over ordinary roads and to do the work intended for its size. We make a liberal guarantee arrangement to take care of the satisfaction of our customers.

See our line before you buy. It is handled by I H C local agent who will show you how big a line it is. Or, if you cannot conveniently see the agent, drop a line to the nearest branch house and we will send full information.

"You Got T' Salute."

An Appropriate Story of Neutrality and Patriotism.

(By Ellis Parker Butler)

Mike Corrigan, his shirt sleeves rolled to his shoulders, was washing the grime from the great strands of muscles that made his arms look like those of a Roman gladiator. For his ablutions he used the kitchen sink, filled to its brim with cold water, and a bar of brown laundry soap. Having cleansed his arms he ducked his head, bringing it out of the water with a noise like unto the puffing of a porpoise. He groped for the roller towel and rubbed his head.

Mrs. Corirgan, standing over the two-burner gas-stove, continued her story of how Grossmeyer, the little German tailor next door, had assaulted little Pat with a barrel stave. From time to time she turned, waving the fork with which she was stirring the frying potatoes, and declaimed against Grossmeyer.

"An' pa," piped Patsy, from his chair at the kitchen table, "he went an' called me a dirty Irish, he did, pa. He lammed me with a barrel stave and he said: "Git out of here, you dirty Irish."

Corrigan turned from his roller towel on which he was wiping his mighty arms. Even Patsy was frightened by the black look on his father's face, for Patsy was not free from a fear that his conduct, if investigated too closely, might not meet with his father's full approval. More than once before, when his father had gone out to wreck quick vengeance on some oppressor of his offspring, the avenger had returned to mete out the punishment where it belonged—on the prime instigator of the whole trouble.

"An' I only called him a Dutchman," whined Patsy. "All I says to him was, 'Aw, you leave me alone, you Dutchman!'"

"Say no more!" said Corirgan grimly.

"An' what harm was Patsy doin' t' th' brute?" asked Mrs. Corrigan spitefully. "Th' poor bye did nawthin' but climb over th' fence t' fetch back his ball, like byes have did since Ireland was free, an' th' Dutchman wint an' assaulted him over th' seat iv th' pants wid th' barrel stave. If a poor lad cannot fetch his ball whin—"

"Say no more!" said Corrigan.

"An' ye did no harm at all t' his cabbage plants, did yet, Patsy?" asked his mother.

"No," said Patsy sullenly. "I wasn't doin' nothin' to him."

"Say no more!" cried Corrigan. "I care nawthin' for his barrel staves or his cabbage plants. 'Dirty Irish' he called us, did he 'Tis gettin' so th' whole world thinks ut can tread awn th' Irish race. 'Tis gettin' so th' wops an' dagoes an' squareheads an' Dutch in th' world make free t' insoolt th' Irish nationality. D' ye mind th' job on th' p'leece force Hogan thought he might me gettin' for me?"

"I do that," said Mrs. Corrigan sympathetically.

"A furriner be the name iv Schwartz got ut," said Corigan.

"For th' love iv St. Patrick." exclaimed Mrs. Corrigan with horror. "A Dutchman awn th' p'leece force!"

"No niss," said Corrigan, hiding his anger under a calm exterior. "An' d' ye know who they put over me for a boss this r

"Haggerty " asked Mrs. Corrigan, although she knew, from her husband's tone that this could not be.

"Haggerty? A dago ne name iv Morosini. 'Tis from a dago I must take me orders, mind ye," said Corrigan, bitterly. "Anny wan can insoolt the Irish these days."

"Hear that now|" cried Maggie.

"But be hanged if I'll accipt an insoolt from anny sawed-off Dutch tailorman that iver was," declared Corrigan. "Ut takes nine tailors t' make a man, an' nine Dutchmen t' make wan Irishman, an' as sure as nine times nine is ninety-nine I'll not be insoolted be th' ninety-ninth part iv a real man. Not whin he lives nixt door t' me, Maggie. In a bit there'd be no livin' in th' neighborhood at all. Th' Irish w'u'd be th' joke iv th' place."

"An' ye s'u'd see Missus Grossmeyer sailin' past wid her nose in th' air an' thim red an' blue roses awn that new hat she—" Mrs. Corrigan began.

"Say no more|" said Corrigan, taking his seat at the kitchen table. "'Tis man's work. L'ave ut t' me."

For a moment there was silence.

"An' you," said Corrigan suddenly to Patsy, "kape out of th' Dutchman's lot, d' ye mind? Th' nixt time I hear of ye in ut I'll wale th' hide off ye!"

"He was but fetchin' his ball back, as anny lad—" Mrs. Corigan began.

"Hush!" said her husband sternly. "I have given th' lad me orders. I'll have no talk over thim. Ye know nawthin' iv th' complexities iv inthernational relations arisin' from th' insoolts iv wan nationality to another, Maggie. Th' question is not, 'Sh'u'd I wale th' bye for trispassin' into th' Dutchman's cabbage patch, or manhandle th' Dutchman for chasin' th' bye?' 'Tis a more seryus matter intirely. Th' Dutch have insoolted th' Irish, an' 'tis a matter iv inthernational enormity for wan nationality t' insoolt another wan."

"What'll ye be doin' t' th' tailorman, Mike?" asked Mrs. Corrigan with tremulous awe. She was of the good Irish stuff that joys in sending the loved one into the fray but weeps while sending him.

Corrigan laid his fork across his plate and tapped the red tablecloth with his stubby forefinger.

"Mayhap I'll be doin' nawthin' t' him," he said. "Time was whin I w'u'd have clumb over th' fince an' murdhered him for whackin' th' bye wid a barrel stave, but that was befoor I was wise t' th' law iv internationality. For th' spoken word iv insoolt t' th' Irish as riprisinted by me youthful son Patsy there's but wan reparation I can accipt. Th' Dutchman must saloot th' flag!"

For a moment Mrs. Corrigan looked blank.

"Saloot th' flag?" she queried "What mean ye by saloot th' flag, Moke?"

"Twinty-one guns, no liss," said Corrigan. "T' reparate for insooltin' th' Irish th' Dutchman must shoot off a saloot iv twinty-one guns t' show his rayspictfulness t' th' green flag iv Erin. Or what I'll do to him will be plinty for him t' remember as long as he lives."

"Hear that now!" exclaimed Maggie. "An' what if th' tailor-man cannot fin' twinty-wan guns, Mike?"

"Don't be showin' yer ignorance befoor th' bye," said Corrigan. "Be th' diplomatic term 'twinty-wan guns' is meant twinty-wan shots from wan gun, if ye cannot get anny more iv 'em. I doubt if th' Dutchman has even wan gun. D' ye know where is th' pistol an' th' cartridges I bought that Foorth iv July befoor Patsy was born, Maggie "

"At th' bottom iv the oak chist back iv th' bed, Mike."

"Fetch thim," said Corrigan, "an' while yer ma is gittin' thim, Patsy go up t' th' attic an' bring me th' green flag I carried last Patrick's day whin I marched wid th' Timothy J. O'Hara Association. Make haste."

For several months the relations between the Grossmeyers and the Corrigans had been strained. The Corrigan goat, wandering into Grossmeyer territory and eating Mrs. Grossmeyer's geraniums the first warm day of spring, had led to a warm diplomatic interchange between the two ladies Mrs. Grossmeyer maintaining the right of territorial inviolability while Mrs. Corrigan pleaded the natural right of goats to wander at will. Mr. Grossmeyer, intervening, erected a fence between the two territories, the fence being composed of sections of old tin roof, barrel staves, laths, chicken wire and some odd lengths of rusty barbed wire. The fence was considered an unfriendly demonstration by the Corrigans, but nothing was done about it and Mr. Grosmeyer made his garden and set out his cabbage plants unmolested, until Patsy Corrigan began to bat his ball over the fence and climb over the fence into the garden to retrieve it. In the meanwhile the feelings of Mrs. Corigan had been hurt by the haughtiness with which Mrs. Grossmeyer flaunted her new hat, leading to more words on a day when the wind was Corriganward and Mrs. Grossmeyer beat a carpet to windward of Mrs. Corrigan's clothesline full of recently washed whitewear. Mr. Corrigan had kept aloof from the increasingly impossible situation until now, when it has culminated in an assault on Patsy and the insult to the Irish nation.

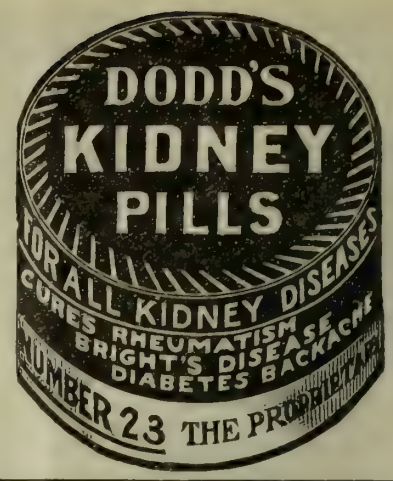
Mr. Corrigan glanced from the kitchen window and saw that Mr. Grossmeyer was working in his garden. Mr. Grossmeyer was kneeling on an old sack which he hitched along as he progressed in his work of setting out tomato plants. His tools were a trowel and a short-handed rake and he had at his side a box containing the tender young tomato plants. To Mr. Corrigan there seemed no possible difficulty in the work he had in hand The little tailor could make no dangerous resistance; it was merely a matter of presenting the ultimatum, forcibly showing the little tailor that an outraged Corigan could beat him to a pulp if necessary, and then dictating the form and manner in which the salute was to be given. To be ready for prompt action if need be Mr. Corrigan rolled up his sleeves above his elbows. Mrs. Corrigan and Patsy returned with the pistol, the cartridges and the green flag with the golden harp, and, bidding the two keep within doors, Mr. Corrigan took the weapon, the ammunition and the colors and stepped into the back yard.

It was a warm evening and Mr. Grossmeyer had laid aside his coat and vest, hanging them on the fence. His collar and tie hung from the short crossbar of the nearest clothes-post in his yard, and he would have been peaceful and happy but for the long-stemmed pipe that hung from his lips as he worked.

Mr. Grossmeyer was a small man and slight of build, but his black pompadour was brushed straight upright in a style that sugegsted defiant independence. His mustache was equally aggressive, being turned sharply upward at the ends like those of a well-known war lord. For important oc-

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box 309, Windsor, Ont.



MRS. MABEN WAS MADE WELL

By Lydia E. Pinkham's Vegetable Compound and Wants Other Suffering Women To Know It.

Murfreesboro, Tenn. — "I have wanted to write to you for a long time to tell you what your wonderful remedies have done for me. I was a sufferer from female weakness and displacement and I would have such tired, worn out feelings, sick headaches and dizzy spells. Doctors did me no good so I tried the Lydia E. Pinkham Remedies — Vegetable Compound and Sanative Wash. I am now well and strong and can do all my own work. I owe it all to Lydia E. Pinkham's Vegetable Compound and want other suffering women to know about it."— Mrs. H. E. MABEN, 211 S. Spring, St., Murfreesboro, Tenn.

This famous remedy, the medicinal ingredients of which are derived from native roots and herbs, has for nearly forty years proved to be a most valuable tonic and invigorator of the female organism. Women everywhere bear willing testimony to the wonderful virtue of Lydia E. Pinkham's Vegetable Compound

Why Lose Hope.

No woman suffering from any form of female troubles should lose hope until she has given Lydia E. Pinkham's Vegetable Compound a fair trial.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

HONESTLY BELIEVED

HE WAS GOING INTO

CONSUMPTION.

DR. WOOD'S

Norway Pine Syrup

CURED HIM.

Mr. Frank E. Anthony, 69 Ellen Street, Winnipeg, Man., writes: "Having taken several bottles of Dr. Wood's Norway Pine Syrup, during the past few weeks, to relieve a chronic cough and general throat trouble, allow me to express my unbounded satisfaction and thanks as to its sterling qualities. A short time ago I became suddenly subject to violent coughing fits at night, and directly after rising in the morning, for about an hour, and found I was gradually losing weight. All my friends cheerfully informed me that I looked as though I were going in consumption, and I honestly believed such was the case. However, after having taken several bottles of 'Dr. Wood's' I am pleased to relate that the cough has entirely disappeared, along with all the nasty symptoms, and I have since regained the lost weight. I have no hesitation in recommending Dr. Wood's Norway Pine Syrup as a sure cure for all those troubled in a like manner."

When you ask for "Dr. Wood's" see that you get what you ask for. It is put up in a yellow wrapper; three pine trees the trade mark; the price, 25c and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

casions he cultivated a glare of the eye that would have cowed a lion, but for all this he was the meekest and gentlest of little tailors except when driven to desperation and then he was apt to do nothing more violent than weep tears of rage. His pipe was now driving him to desperation. From minute to minute he puffed violently at the pipe, but his only reward was a sickening gurgle. From time to time he sat back on his knees, and felt in all his pockets for a match, and found none.

"Ach!" he exclaimed, and puffed at the pipe again.

In the top of the bowl the smallest possible spark remained, but Mr. Grossmeyer's most violent puffings would not induce it to spread. He put out his hand and grasped a straw, inserting it carefully in the pipe stem. Through his spectacles his eyes glared at the pipe. Carefully he pushed the straw, urging it into the stem, and then as carefully began to withdraw it. Half the straw came out. The other half, lost in the long tunnel of the pipe stem, remained. Mr. Grossmeyer uttered an ejaculation of deep condemnation. He tried the pipe. It was Dutchman can do whilst Corrigan has his healt' an' stren'th. In th' name iv all th' Irish in Ameriky, Grossmeyer, thoroughly and everlastingly plugged.

"Ach, schrecklich!" he cried and threw the pipe violently over the fence. It struck Mr. oCrigan in the chest.

"Ye murdersome divvil!" cried Mr. Corrigan angrily, and Mr. Grossmeyer looked up to see Mr. Corigan leaning over the fence, the green flag of Ireland in one hand and a glittering revolver in the other. It was no time for parley. Mr. Grossmeyer instantly raised both hands.

"Don't shoot!" he begged. "I gif up! Don't shoot!"

"Ye little sawed-off, d'ye think I'd be shootin' th' likes of ye?" exclaimed Mr. Corrigan with disgust. "D' ye honor yerself be thinkin' that Mike Corrigan w'u'd fetch a pistol t' kill ye? If 'twas killin' ye I was after I'd but crush ye between me thumb and finger."

"As a favor I ask you, don't shoot!" begged Mr. Grossmeyer. "Please don't shoot!"

"An' didn't I tell ye I wasn't comin' t' shoot ye?" cried Mr. Corrigan angrily. "D' ye mean t' say I'm a liar, Mr. Grossmeyer? First I'm a dirty Irish, an' nixt I'm a liar, an' what will I be nixt, I want t' know Put down yer hands, an' quit exposin' yer cowardice, Mr. Grossmeyer."

"Me, Grossmeyer, a coward, hah!" he shouted. "Because I stop me think off my wife yet, you call me a coward, yes? And already I make me an application today for such a life insurance, und I ain't got it yet, und I am a coward| Hah! You make me a shootings, und I am dead mit no policy insurance yet, und I am a coward! Und because I don't—Ach, Gott! Shoot! Shoot!"

"I do not want t' shoot ye!" said Corrigan, pronouncing each word slowly and distinctly. "Will ye listen t' me? This afternoon me bye Patsy—"

"Und it is me I am a coward!" cried Grossmeyer. "Mit a gun you come shooting me, und baseballs over de fence coming every day yet, und I am a coward, und—und walking on my cabbage plants, und—und pistols, und —und shootings mit guns—und—und cowards."

He was inarticulate with rage.

"Will ye be still?" asked Corrigan. "This afthernoon me bye Patsy clumb over th' fence t' fetch his ball—"

"Und shootings, und—und guns, und —und Annie gets no policy insurances —und—und I am a coward."

"He clumb over th' fince," said Corrigan, "an' ye slatted him wid a barrel stave—"

"Guns, und—und shootings, und—und I am a coward!" wept Grossmeyer.

"An' I'll say nawthin' iv why ye slatted him," said Corrigan, "but whin ye insoolt th' whole Irish people 'tis time th' Dutch learned a lesson. Ye have insoolted th' flag iv Ireland be th' words an' phrases ye uttered, Mr. Grossmeyer."

"Und I am a coward!" said Grossmeyer, beating his breast.

"Shut up!" shouted Corrigan. "I don't care a hang if ye are a coward or the king iv Germany. Ye insoolted th' Irish nation, and that's what no I demand reparation for th' contamination ye have done th' isle iv Erin. All iv ye undesirable furriners are gettin' too haughty t' live wid. Th' ind has come. For th' ignominy ye cast awn th' min iv the old sod ye must saloot th' flag, Grossmeyer!"

As if a spring had snapped Grossmeyer's mouth fell open. He stared at Corrigan. He was dazed. He could have believed many things of his hot-headed neighbor, but this he could not believe. He, a German, must salute the flag of a Corrigan? It was so impossible that he could not speak. Nations might salute; kings and presidents, when at fault, might salute, but who ever heard of a private citizen, standing on his own land, being ordered to salute? It was grotesque. Impossible! Before he would raise his hand to his brow in salute to the green flag he would let Corigan shoot him as full of holes as a sieve.

"Befoor I climb over th' fince an' choke th' heart out of ye," said Corrigan, "give me th' answer—will ye saloot th' flag or no? Will ye saloot or take th' consequences?"

Grossmeyer kept his eye on the pistol. He moistened his lips but no words came forth. He was a brave

GRAY HAIR

Dr. Tremain's Natural Hair Restorative, used as directed, is guaranteed to restore gray hair to its natural color or money refunded. Positively not a dye and non-injurious. Price $1.00, post-paid. Write **Tremain Supply Co., Dept. 31 Toronto, Ont.**

Edwardsburg "Crown Brand" Corn Syrup
POUR IT ON PORRIDGE
YOU can't imagine how delicious a dish of Oatmeal Porridge becomes when it is sweetened with "Crown Brand" Corn Syrup.
Have it for breakfast to-morrow—watch the kiddies' eyes sparkle with the first spoonful—see how they come for 'more'.
Much cheaper than cream and sugar—better for the children, too.
Spread the Bread with "Crown Brand"—serve it on Pancakes and Hot Biscuits, on Blanc Mange and Baked Apples—use it for Candy-Making.
"LILY WHITE" is a pure white Corn Syrup, more delicate in flavor than "Crown Brand". You may prefer it.
ASK YOUR GROCER—IN 2, 5, 10 & 20 LB. TINS.

RED ROSE TEA "is good tea"

little man, but a pistol is a very deadly weapon and there is no acounting for the vagaries of an Irishman. Perhaps, in Kilgarry or wherever Corigan came from, it was the custom to shoot neighbors for nothing. Grossmeyer did not know.

"Twinty-wan guns!" declared Corrigan. "Will ye shoot off th' twinty-wan guns iv saloot usual in reparative circumstances like unto this, Grossmeyer, or will I climb over th' fince?"

"Sooner I would be dead as salute mit twenty-one guns," declared Grossmeyer angrily, his speech returning in a rush.

"An' that's what ye will be," said Corrigan meaningly. "I give ye 'till I count tin, Grossmeyer. Wan—two—three—"

Corrigan put one leg over the fence at the place where it was free from barbed wire. It was evident he meant business. Grossmeyer cast a glance toward his house. Flight was impossibel.

"I don't know what iss it, saluting mit guns," he temporized. "Maybe I salute yet when I know what iss it. Such quickness you make it, mit salutings und guns und flags. How should I know what iss it?"

"Ye thick head!" said Corrigan. "Ye know nawthin' at all. Here is th' green flag ye insoolted, an' here is th' gun t' shoot th' saloot, Mr. Grossmeyer, sir. Ye will put th' flag at th' top of yon clothespost an' shoot off the pistol twinty-wan times, in honor of it and in apology t' th' Irish race, Mr. Grossmeyer, sir. Or ye'll git what's comin' t' ye."

Mr. Grossmeyer blinked. It was an admirable imitation of stupidity.

"Mit der pistol I shoots me twendy-one times, yes?" he asked.

"In the air," explained Corrigan. "In saloot t' th' flag ye will put on th' top iv th' clothes-post."

"Und why shouldn't I shoot der pistol " asked Mr. Grossmeyer. "I makes me no troubles aboud it. Gif me der pistol."

Mr. Corrigan handed the pistol across the fence. He had out the flag too, but Mr. Grossmeyer did not take it. Instead he poitned the pistol full at Corigan's breast. He grinned until the tips of his mustaches almost touched his eyes.

"Raus mit you, quick!" he cried. "Sooner I shoot you as a dog already."

"Ye'll shoot nawthin' wid that pistol 'til ye put ca'tridges in ut," said Corrigan calmly, "for 'tis as impty as a church. For such tricks I sh'u'd come over an' beat ye up, Grossmeyer, but I l'ave personalities by 'til ye have given th' saloot. Are ye ready. Three I have counted. Four—five—"

Grossmeyer turned pale. He looked into the barrel of the pistol. Thus closely inspected the weapon seemed far from well kept. Masses of rust clogged the barrel and prevented the cylinder from revolving.

"Such a pistol!" said Grossmeyer, fighting for time. "Sooner I shoot it it busts maybe, und kills somebody. Such rusted pistols. Und you should ask me mit such pistols to salute!"

"Hand me th' gun!" ordered Corrigan. He examined it closely. It was not indeed, a safe looking firearm. He tried to force a cartridge into one of the chambers, but in vain.

"Have ye a betther wan iv yer own?" he asked at last.

"Me? I should have a pistol|" lied Grossmeyer. "I should keep pistols und guns und—aber tomorrow," he added brickly, "maybe I could from Gluck his duck-shooting gun get it. A fine gun iss it, mit shells und—und—"

"Mike! " called Mrs. Corrigan from the back door. "Are ye goin' t' listen t' th' hot air iv the Dutchman all night? I've heard no shootin'. Kape on an' he'll be makin' ye think 'tis you that's t' saloot."

"Have no fear, Maggie," said Corrigan. "I am but considerin' where I can fetch a gun from."

Britain's Greatest Remedy

The Proved Cure for

Nerve, Stomach, and Kidney Disorders in Young or Old.

The effect of the Famous British Remedy, Dr. Cassell's Tablets, on the human system is to increase that vital energy upon which health and fitness depend. The stomach and other organs gain new power from Dr. Cassell's Tablets, and thus nourishment is supplied to the entire system. The muscles recover strength, and the body is built up anew.

Dr. Chas. W. Botwood, D.Sc., Ph.D., &c., the well-known scientist, says, "Having had my attention called to many remarkable cures effected by Dr. Cassell's Tablets, and having personally investigated the same, I am now in a position to state that, as a safe and reliable remedy for loss of flesh and vigour, nerve affections and bodily weakness induced by deficient assimilation of beneficial food products, Dr. Cassell's Tablets appear to be unique, and I have no hesitation in recommending the same as a really trustworthy household remedy for young or old."

Throughout the world Dr. Cassell's Tablets are recognised as the great strengthening medicine, are Nutritive, Restorative, Alterative, and Anti-spasmodic, and of proved Therapeutic value in all derangements of the Nerve and Functional Systems in old or young. Unexampled success has established them as the modern home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and for all women during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto; one tube, 50 cents, 6 tubes for the price of five.

Dr. Cassell's Tablets

Mrs. Corrigan came into the yard, and Mrs. Grossmeyer, who had been watching her husband from her own kitchen window, ready to take a hand in case any violence threatened him, came also, as rapidly as her weight and size allowed.

"Vot iss?" she asked.

"I am but askin' ye'r husband t' saloot th' flag because iv th' insoolt he placed upon ut, Mrs. Grossmeyer, mam," said Corrigan with forced politeness. "I am but askin' the customary saloot iv twinty-wan guns, mam. I trust ye have no objections t' ye'r husband performin' th' usual ceremony iv reparation in such cases made an' provided, Mrs. Grossmeyer. For if ye have," he added, "'twill be me duty t' lay rough hands upon him should I have t' lick all th' furriners in th' neighborhood."

"Vooden-head!" Mrs. Grossmeyer exclaimed, glaring at her husband. "Haf you such a fool been to insult it the American flag, hein? Mit wars going on und all? Sooner you go by Mexica und be a rebel as you do it!"

"Annie! Nefer haf I insulted der American flag!" said poor Mr. Grossmeyer, appealingly. "I should insuld der American flag, yes Am I crazy, yes?"

"'Twas the Irish he insoolted, mam." said Corrigan haughtily. "An' 'tis th' flag iv Ireland he must be salootin'."

"Ach!" exclaimed Mrs. Grossmeyer with disgust. "Always, Mrs. Corrigan for such nonsense iss it the men make such troubles between good neighbors yet. For such German flags und Irish flags we should to have fightings! Such a crazy business! I should worry if Grossmeyer salutes a flag! Better I should worry he wastes time when he should be planting tomato plants."

Mr. Grossmeyer looked at his wife in amazement. He had counted on her warm support, and she deserted him for the enemy.

"Make such a salute, Grossmeyer," she ordered, "like Mr. Corrigan wants it. I fetch me der German flag out."

"We nade no German flag, mam," said Mr. Corrigan. "I have th' green flag here, as ye may see."

Mrs. Grossmeyer had turned away; she turned back again.

"So?" she queried, letting her placid face show the utmost surprise it was capable of registering. "Maybe it iss a new kind of salute I don'd hear aboud yet. I am only a vomans, Mr. Corrigan. But always by the newspaper I read how it must be one salute goes mit another salute. Always! For such insults Mexico could salute the American flag, yes, und right away should the Ameircanish shooters salute the Mexicanish flag. Odor it iss no salutes at all, schust gun shoodings. One should to salute like saying 'I make apology for what I did it!' und right away other should salute like saying 'Much obliged, I accept such an apology like you make it! ' Maybe it iss a new kind of salute you hear about, Mr. Corigan, mit only one salutings?"

She was suave. She was polite. She was apologetic. But with all that she was annoyingly ironical. Mr. Corirgan coughed uneasily. Nothing annoys a man more than to go forth to uphold his dignity and then discover that he is being ridiculous. Mr. Corrigan's face flushed. He suddenly felt that his knowledge of international affairs was founded on sand. He ignored Mrs. Grossmeyer.

"You got t' saloot!" he shouted at Grossmeyer. "Wan flag, or two flags, or sivin hundred thousand flags makes no diffirence to Corrigan I do not care a hang what may be th' formality iv proceedin', ye have insoolted th' Irish an' ye have got t' saloot!"

"|Sure, you should salute Gross-

meyer," said his wife. "Und if Mr. Corrigan likes one flag salutings, you should care! Iss it your business. Grossmeyer, if everybody laughs at Mr. Corrigan because of one flag salutings? No, Grossmeyer! Salute it like Mr. Corrigan should want it."

"I got me no such pistols und guns," said Mr. Grossmeyer meekly.

"Right away I go me by Kilmer's saloon und borrow a pistol," said Mrs. Grossmeyer. "Und next time you should not make such insults to neighbors. You make me ashamed, having such salutings to make. Twenty-one und twenty-one iss forty-two cartridges I must get, yes? Und right away we get arrested for shooting guns inside the city limits, maybe! Unless Kilmer could fix it. He's got plenty pull, yet. I come back, quick!"

"Anyhow," said Corrigan grimly, when Mrs. Corrigan disappeared, "you got t' saloot, Grossmeyer!"

"Salute, hah!" cried Grossmeyer, "I salute me der Irish flag und you salute you der German flag. Sure I salute! Because you should be a bruiser und a bigger man as I am I salute der Irish flag, but I don't mean it. Und you salute der German flag. I salute and don't mean nodding und you salute und mean it. Sure! All right! An Irish salutes der German flag! Fine!"

"Now, fer that," said Corrigan, narrowing his eyes, "be hanged if I saloot anny Dutch flag that ivir was!"

"You gotto salute,' 'said Grossmeyer with irritating calm. "Like Annie says it is so iss it. Ven you don'd salute back again, I could to salute a millionen times und it means noddings! Sure, you got to salute! Oder everybody iss laughing mitt you."

"Mike!" said Mrs. Corigan. "Why don't ye jump over th' fince an' have done wid him?"

"Lave be!" cried Corrigan angrily. "He's got t' saloot."

"Und you got to salute!" said Grossmeyer.

"Nivir in th' worrld will I saloot th' Dutch flag!" declared Corirgan. "So help me all th'——"

He stopped short. Mrs. Grossmeyer accompanied by Kilmer, six barroom loafers, fifteen or twenty small children of varied nationalities and such of the adult neighbors as had happened to be at their front gates, entered the Grossmeyer yard. Mrs. Grossmeyer was in the lead and Mr. Kilmer, bearing a large American flag and a steel blue revolver followed close. He was red from the speed he was making, for he was a huge mount of a man, blue-eyed, tow haired and with great puffy jowls. The imperfect information of proceedings in contemplation had resulted in a sudden rumor that Grossmeyer and Corrigan were about to fight a duel with pistols and that Kilmer had come to see fair play, bringing — probably — the American flag to wrap around the corpse of the defeated duelist. The interest was intense.

"Stand back!" said Kilmer to the crowd. "What's this nonsense Annie has been telling me? What do you mean by trying to make Grossmeyer salute that Irish flag you're so free with?"

"He insoolted—" began Corrigan with the respect due to the leader of "de tenth" and boss of the lower end of town.

"Never mind about that!" said Kilmer. "What do you mean by making a German salute an Irish flag? And what is this nonsense about making Corrigan salute your German flag, Grossmeyer? How did you vote last time, Corrigan?"

"Straight," said Corrigan, "but, for all that, he's got to saloot—"

"And how did you vote?" asked Kilmer, pointing an accusing finger at Grossmeyer.

"Same like you toldt me," said Grossmeyer, "but ven I salute so must he salute. Odor, ven he does not salute—"

"You bet you'll salute!" puffed Kilmer. "You'll both of you salute, and mighty soon, too."

"Fer th' insoolt he did t' th' Irish—" Corigan began, but Kilmer stopped him short.

"For th' insult, whatever it was, he'll salute!" said Kilmer. "For trying to bulldoze a German into saluting your green flag you ought to be chased out of the ward. And you, Grossmeyer, you ought to know well enough that no Irishman would stand for being made to salute your German flag. Now, listen to me. I won't have this sort of foolishness in my ward. The next time you get in a row, come to me. You're both ignorant. You don't know what you're talking about. You are acting like a couple of children."

"He's got t' saloot—" said Corrigan sullenly. "For insultin' me he's got t' saloot me flag—"

"And you," said Kilmer, shaking his finger in Corrigan's face, "don't know what your flag is! Why, you poor ignorant fellow, you're an American. You're a full-naturalized American citizen. You with your Irish flag, and Grossmeyer with his German flag! You make me sick. Here's your flag, the both of you!"

He rammed the lower end of his flag-pole into the soft soil and let the stars and stripes wave indolently in the slight evening breeze.

"Now, then!" he said. "You've both got to salute! Grossmeyer's got to salute Corrigan's flag, and Corrigan's got to salute Grossmeyer's flag, and there's the flag."

"Sure," said Grossmeyer with a grin, "I salute me dot flag all night yet mit pleasure!" and he put out his hand for Kilmer's pistol. Kilmer counted.

"Nineteen! Twenty! Twenty-one!" he said, keeping track of the shots.

"Give me th' gun,' 'said Corrigan, good naturedly, 'till I accipt Mr. Grossmeyer's apology t' th' citizens iv th' United States located awn this side iv

Was Not Much of a Believer in Patent Medicines

But Milburn's Heart and Nerve Pills Are All Right.

Mrs. Wm. McElwain, Temperance Vale, N.B., writes: "I am not much of a believer in medicines, but I must say Milburn's Heart and Nerve Pills are all right. Some years ago I was troubled with smothering spells. In the night I would waken up with my breath all gone and think I never would get it back. I was telling a friend of my trouble, and he advised me to try Milburn's Heart and Nerve Pills. He gave me a box, and I had only taken a few of them when I could sleep all night without any trouble. I did not finish the box until some years after when I felt my trouble coming back, so I took the rest of them and they cured me."

Milburn's Heart and Nerve Pills have been on the market for the past twenty-five years. The testimony of the users should be enough to convince you that what we claim for them is true. H. and N. Pills are 50c per box, 3 boxes for $1.25; at all druggists or dealers, mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When I Think of Business Education

I think of the Moncton Business College, said a business man the other day. The school has given a quality of service along this line that has established it as a necessary factor in the educational life of the community.

You should enrol NOW.

Moncton Business College
Geo. J. Schmidt, Principal
Moncton, N. B.

Opportunities for Girls

It looks more and more as if, owing to scarcity of skilled men, women will have to do much of the work hitherto done by men.

This is especially true of office work.

Of course, we are prepared to qualify either men or women to take advantage of their opportunities, and you can enter at any time.

Health.

Foods That Give Bulk.—All vegetable foods contain more or less cellulose, but the amount differs very greatly. This element, has already been mentioned, is highly necessary as a means of securing normal bowel action. Indeed, bulk is not simply in the food itself, but in the residues left behind, after the absorption of the nutritive portions of the food, is of first importance. This quality of food is even more important than the antiseptic properties, for the reason that putrefactive bacteria may always find in the bile and other intestinal secretions abundant material to support their growth, provided sufficient delay occurs to encourage putrefactive changes. The thing most necesary in the prevention of putrefaction is rapidity of movement of food residues and body waste along the intestine to the exit. Fine flour bread should be wholly discarded from the bill of fare, giving way to bread or biscuit made from whole-wheat meal or rye flour. Wheat meal and bran prepared from thoroughly washed wheat should be used, for both contain enormous quantities of dirt and bacteria, which are especially harmful to persons suffering from constipation.—Dr. Kellogg.

Hints for Bay's Bath.—The temperature for the bath is determined by age; screens form draughts. Also, there should be plenty of water, in order that the little body should be completely covered and not left with a considerable portion above the level of the but it is necessary that it should be given to infants and quite little children in a warm room, protected with warm water to feel by contrast the cold. The temeprature of an infant's bath should be from 95° to 100° Fehr., and this must be tested always with a bath thermometer. This is a point which cannot be too strongly insisted upon, as cases of harm occur from the delusion that a nurse is able to gauge the temperature accurately in any other way. Also—and a most important point—a little cold water should always be put in the bath first. Neglect of this simple precaution has led to trouble, for a layer of hotter water may easily get left at the bottom of the bath when the temperature of that above has been satisfactorily regulated, with the result that the unfortunate baby is put down into water of possibly scalding heat. This can never occur if the "cold water first" rule is religiously followed. By the end of the first month the temperature should have dropped to 95 deg., and from then unwards must be gradually lowered until at six months it is 90 deg. Fehr.—"Queen."

Beauty and Health.—Health is the foundation of beauty. To be really beautiful, one's beauty must be more than skin deep. Do not be satisfied with the beauty that is deep enough merely to deceive the superficial onlooker. It was Aristotle who said that beauty of figure is far more to be admired than mere beauty of face. This means that one must have not only a beautiful face, but beautiful hands as well; not only a good complevion for the face, but a god complexion all over. The writer was very much shocked, in examining a young lady with a beautiful face, to find that her back was covered with pimples. When told what they signified, she said, lightly, "If it was on my face I should feel awfully bad about it, but as long as it is out of sight I don't mind it." But pimples on the back mean the same thing as pimples on the face—uncleanness inside; the whole body is in a state of uncleanness, and of low resistence because of this inner uncleanness. The only way to be really beautiful is to live beautifully, to live rightly. If one is going to be beautiful, for example, one must eat beautiful things, because our bodies are made of what we eat. No one admires brown circles around the eyes and brown patches on the hands, and a leather-colored skin. One knows what these things mean. Behind the leather-colored skin is a bad breath. Behind that bad breath is impure blood—blood charged with these sace offensive aromas that are coming out of the blood; for that is where these offensive odors come from; the blood picks them up in the colon and other parts of the body and carries them to the lungs where they are poured into the breath. The breath is bad because the whole body is bad.—Dr. Kellogg.

Try an Ad in the FARMER

sumption of alcohol by the community would mean less tuberculosis, less poverty, less dependency, less pressure on our hospitals, asylums and gaols. Intemperate drinking cuts into the support of the family. The drinking of parents weakens the vitality of children. Drinking mothers lose twice as many children as do sober mothers. More alcoholism is found in the parents of feeble-minded children than in the parents of normal children. The children of drinkers develop more slowly and do poorer school work than do the children of abstainers. Alcohol impairs the tone of the muscles and lessens the product of laborers; it depreciates the skill and endurance of artisans; it impairs memory, multiplies industrial accidents, causes chronic disease of the heart, liver, stomach and kidneys; increases the death rate from pneumonia, lessens natural immunity to infectious diseases.—Dr. Goldwater.

Effects of Indigestion.

Imperfect digestion lies at the foundation of a greater variety of diseases than any other one cause. The various vital processes, the sum of which makes up the life of every individual, depend most largely upon the digestive organs for their character and continuance. All the energy manifested in the vital processes is latent in the food we take. In order that the different organs of the body may appropriate this energy for the performance of their functions, the food taken must be properly digested. When the digestive organs do not perform their work naturally the whole system suffers from lack of nourishment. Nor is this all. When indigestion supervenes fermentation or decomposition of food always takes place. Food material thus affected becomes poisonous to the system, and this poison, absorbed into the circulation and carried to every part of the body, poisons and consequently weakens every organ and every cell.

An acute attack of indigestion temporarily weakens the system and may give opportunity for the contraction of many forms of disease, but when such a condition becomes chronic it greatly favors the inception of many serious forms of disease. There are doubtless many cases of tuberculosis which would never have been contracted had not the system been weakened by chronic indigestion. Many disorders of the liver, kidneys and intestines, and a great variety of nervous affections, can easily be traced to the poisoning of the system resulting from imperfect digestion.

Custards in Variety.

Of desserts, custards were favorites with our foremothers because eggs and milk were readily obtainable. The usual proportion was four eggs to a quart of milk although when plentiful six were often used. A simple soft custard is made by beating the eggs with the sugar—one-half a cupful to the quart—adding the milk, pouring into a double boiler and stirring until the mixture begins to thicken. If the heat is strong it is then well to lift out the upper vessel for a moment and to repeat every few minutes as it lessens the danger of cardling. When the custard is thick enough to coat the spoon, strain and set it aside. As most flavorings are in the form of extracts—in which a certain amount of alcohol is used—it is best to wait until partly cooled to add the variety desired. For baking, strain the above raw mixture into cups or molds, stand in a pan of warm water and place in a moderate oven until a knife of spoon carefully inserted in the centre will come out clean. Renversee or caramel custard calls for a caramel coating. To make this put one-half a cupful of granulated sugar in a frying pan and stir over a moderate fire until melted and golden brown in color. Pour quickly into the dish or mold turning to coat the bottom and sides; when cool and hard pour in the strained mixture and bake.

"Metallic" Corrugated Iron Barns are Lightning, Fire, and Weather-Proof

Lumber and labor are too expensive to be used in farm buildings; besides, wood buildings are easily destroyed by fire and lightning. "Metallic" Corrugated Iron makes buildings that last a life-time; that are warm and dry; and proof against fire, lightning and weather.

Costs Less Than Lumber

You save money on labor and lumber when you use "Metallic" Corrugated Iron. Write for complete information before you buy any building material. We can save you money. Our corrugated iron is made in galvanized or painted sheets, straight or curved. 7

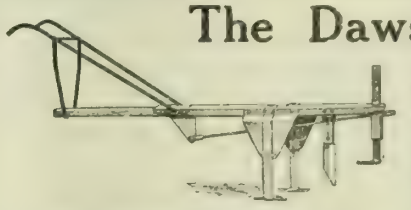
The Dawson Ditch Digger



Price $38.00 F.O.B. Toronto

Will dig 5 feet or more in depth, cutting the ditch 10 inches wide, allowing the [illegible] as large as 8 inches if needed. The average cost of ditching with the **Dawson Digger** per 100 feet, which is approximately has averaged up to $1 50 per 100 feet, that is, to dig the drain, lay the tile, and to fill the drain back in again. We do not say that it will cost every farmer $1 50 per 100 feet, or 6 rods, as it has been our experience that lots of drains with the **Dawson Digger,** have been put in under 70 cents per 100 feet. We know, however, that the **Dawson Ditcher,** if handled according to instructions, will pay for itself in 2,000 feet of ditching, whether you figure it against hand or machine ditching.

Write for full particulars, and testimonials from farmers who have used the Dawson Digger.

Mutton Hams.

B. J.—Mutton hams are a choice delicacy when well cured. They should be well rubbed with a mixture of equal parts of salt and brown sugar, and left to drain for twenty-four hours. The pickle from the bacon and hams is then reinforced with some brown sugar, and boiled and skimmed, and when cold is poured over the mutton in the salting tray; or a pickle made especially for them can be used, viz.: 2 lb. each of comomn and bay salt, 6oz. of saltpetre, 1oz. of sal prunella, and 1 lb. of brown sugar boiled in 4 quarts of water for two hours, the brine being frequently skimmed. The pickle when cold is poured over the hams, previously salted, drained and wiped, and the meat placed in the pickle for about two weeks, when it is dried and smoked. A few bunches of sweet herbs laid in the pickle add a desirable flavor to the meat. It is necessary to dry the hams gradually, and smoke them only a little each day, and the smoke should be cold. This rule applies to bacon and pork hams as well.

Yeast.

M. G.—A yeast which should suit you admirably is made as follows: Take 1 gallon of water, 6oz. hops, and 2 lb. sugar. Put the hops and sugar in the water, place over the fire for five or ten minutes until it comes to a boil. Strain through a cloth into a baking dish, wringing the water well out of the hops. Let the liquor cool to about 70° Fehr. Then stir in 6oz. of flour which has been reduced to a thin batter in cold water, care being taken that all lumps are well beaten out. Then bottle, filling to about ¼in. above the shoulder. Cork tightly, tie down with strong cord, and set the bottles in a temperature of 70° Fehr. In a short time the yeast will begin to work, and will continue to do so for three or four days. All the organic matter will then settle to the bottom and the liquor become clear. The yeast is now ready for use. If intended for future use, set past in a cool place. When required put the bottle by the fire until fermentation again sets in.

th' fince. Here's lookin' at th' Rid, White an' Blue, Grossmeyer. Good luck t' ye!"

"Seventeen! Eighteen!" counted Kilmer, and loaded the revolver again. "Nineteen! Twenty! Twenty-one!"

Grossmeyer twisted one of his mustache ends sheepishly for a moment.

"Ven I get so mad," he said to Corrigan, "mit cabbages plants joomped on und scoost planted already, I say me witout thinking whatever comes my head into. I don't mean it by my heart ven I say 'dirty Irish' by your Patsy. I mean noddings at all by it, Mr. Corigan. He vas a clean boy."

"Lave be, Grosmeyer!" said Corrigan good naturedly. "I've a hot temper iv me own. Th' worrds riled me, ye see. But at that," he added, "tw'u'd do Patsy no harm t' wash his face wance in awhile, Mr. Grossmeyer. We that are Americans sh'u'd sit an ixample t' th' Wops an' th' Dagoes an' furriners in gen'ral!"

Apple Syrup.

(Continued from Page 119)

tated chalk, is a low-priced chemical available at any drug store. Boil in kettle or vat vigorously for a period of 5 minutes. Pour the liquid into vessels, preferably glass jars, or pitchers; allow to stand 6 to 8 hours, or until perfectly clear. Pour the clear liquid into preserving kettle. Do not allow sediment at bottom to enter. Add to the clear liquid one level teaspoonful of lime carbonate and stir thoroughly. The process is completed by boiling down rapidly to a clear liquid. Use a density gauge or candy thermometer and bring it up to 220° F., or, without, thermometer, reduce bulk to one-seventh of original volume. To see whether it is cooked sufficiently, test as you would syrup or candy, by pouring a little of it into cold water. If boiled enough, it should have the consistency of maple syrup. It should not be cooked until it hardens like candy when tested. When the test shows that the syrup has been cooked enough, pour it into fruit jars, pitchers, etc., and allow it to cool slowly. Slow cooling is important, as otherwise the suspended matter will not settle properly and the syrup will be cloudy.

A good way to insure slow cooling is to stand the vessels full of syrup in a bucket or wash boiler of hot water. They may also be placed in a fireless cooker. The white sediment which settles out during cooling is called "malate of lime" and is a compound of lime with the natural acid of the apple. When the syrup is cooled, it should be stored in fruit jars or bottles. Place the rubber cap or cork in position and tighten. Then place the bottles or cans of syrup in hot water and sterilize for 12 minutes in hot-water or home-made outfit.

GIRLS—This beautiful stylish muff will keep you lovely and warm this winter and it is so handsome and dressy that you will be the envy of all your friends. It is the very newest pillow shape—and extra large in size, measuring more than 16 inches wide by 10 inches deep. It is lined throughout with fine quality black satin with the new ruffle edge and finished with a silk wrist cord. This lovely muff is warm and dressy, will give you years of wear and satisfaction and is surely just what you most want.

We are prepared to give away, **absolutely free** 1,000 of these handsome muffs to quickly introduce our delightful new Royal Japanese Perfume. Simply send your name and address today and we will send you 35 handsome bottles in 6 different delicious odors—Lily of the Valley, Carnation, Wood Violet, White Rose, etc. Help us advertise this delightful perfume by selling these among your friends at our special introduction price of only 10c each. It is very easy as many ladies buy 5 and 6 bottles of this fine perfume on sight. Return our **$3.50** when the perfume is sold and we promptly forward the muff just as represented, all charges paid right to your door. We guarantee satisfaction. Write today to

An Appreciation of the M. S. B. A. and the Maritime Winter Fair.

(Continued from Page 115)

or else you have attained that state of perfection where it will be impossible to make further improvements on yourself or your methods. If you are in the latter class, it is your duty to come to the Fair and let your light shine.

With such men as Col. H. Montgomery-Campbell as president and F. L. Fuller as secretary-manager, and their able corps of assistants in the respective departments of the work, no fear need be felt for the continued progress, welfare and educational value of The Maritime Winter Fair.

The prize list has been augmented to the extent of $1,000 this year and $3,000 has been spent since the last Winter Fair in alterations and repairs.

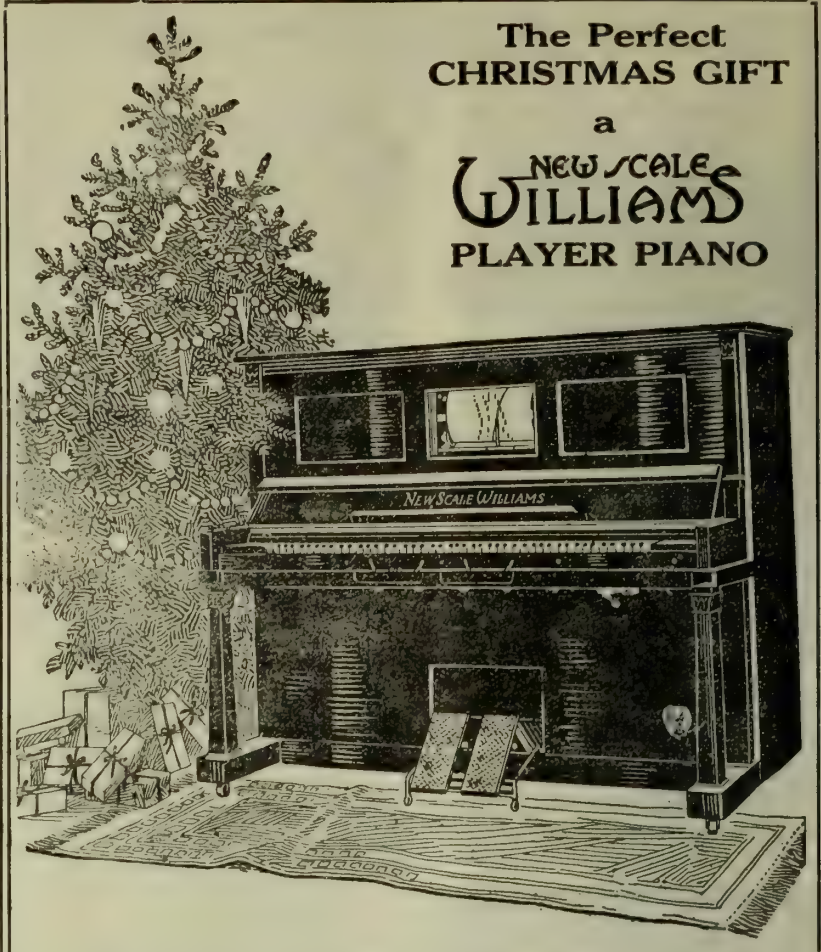
The fair will be held this year on December 6, 7, 8 and 9. The president says, "Come"; Mr. Fuller says, "Come"; and the Stock Breeders say, "Come." Come with us and we will do you good.

Boiled and Baked Custard.

W. A. T.—The following is a good recipe for a plain, boiled custard: Boiling milk, 1 qt.; sugar, 2 oz.; thin yellow peel of half a lemon. These are mixed and set aside for a short time. Beat up four eggs in a basin and gradually add the milk (not too hot) to the beaten eggs. Pass the mixture through a colander or sieve and fill the custard cups with the strained mixture. The cups are placed over the fire in a stewpan containing about an inch of hot water, and are left there for 12 minutes, or till sufficiently set. Baked custards are made from 1 qt. of cream with four eggs, flavored with mace, nutmeg and cinnamon. A little white wine, rose-water, and the sugar are added and the custards baked in cups.

Fish bones in the Throat.—Prevention is the first aim, and should be fairly easy. It is well not to feed children, at any rate, with fish of the particularly bony order. And generally the accident would seem the consequence of undue haste or negligence. It scarcely ever occurs in adults who eat slowly and take pains properly to masticate their food. Should a bone really lodge in the throat, you may try to dislodge it by gulping down large mouthfuls of bread and milk or rice pudding. Failing this, see the doctor. It is important to remember that the sensation often persists—especially in nervous people—long after the cause has been removed. Repeated gargling with warm vinegar and water may be resorted to by an adult.

The Perfect CHRISTMAS GIFT a NEW SCALE WILLIAMS PLAYER PIANO



Give your family a Christmas present that will
—please mother and brighten the home,
—please the children and teach them the value of good music,
—please father and take his mind off the daily cares of his workaday life
With a New Scale Williams Player Piano, you, yourself, and your children can play the most difficult compositions of the world's greatest musicians, without a tiresome course of lessons, through the Mæster Touch device, which is found in no other piano.

If you write AT ONCE we will guarantee to have a piano or player piano in your home in time for Christmas.

Write today for handsome catalogue of different models and let us explain our easy payment plan.

A Very Serious Disease of Dairy Cows

Combating Contagious Abortion.

My eight years' experience proves that an abortive cow does not transfer the disease to other cows except through the bull.

Soon after I began farming I began a study of contagious abortion and in every case I traced I found that the bull became infected from the cow and passed it along to other cows.

The course of treatment described I have tested as I went along and have rid a number of cows of this disease. Early last spring I used an infected bull that I borrowed from a neighbor and supposed was clean. He infected four of my cows and I used this treatment to cure all of them.

My method is disinfection with carbolic acid solution. I had a tinsmith make a gallon can shaped like a kerosene can, but without a bottom. The funnel-shaped end fits a small hose. On the large end of the can I put a bail so as to hang on a hook above the cow. I fill this with disinfecting solution and thoroughly wash the infected parts. Tie a red string tightly around the hose nine inches from the end as a mark so as not to push the hose far enough in to hurt the cow's ovaries. This apparatus costs 60 to 70 cents.

Simple Test for Strength of Acid

I use carbolic acid crystals. I dissolve them and pour enough into a quart of clean lukewarm water to give it a tang, but not make the tongue smart. I am careful to have everything clean, and I always taste the mixture so as not to burn the cow.

Dip the end of the hose into liquid before inserting into the vagina. It kills possible dust germs on the hose and makes it enter easier. Push it in carefully to the red string, and as soon as she stops fussing hang the can on a hook above the cow. Release the liquid through the hose, continuing until the cow discharges the liquid. This should be done 24 hours after freshening and continued every day for a week, and every three days thereafter until she comes in heat, then about every five days. Within 24 hours after service she should be treated again.

For the bull, use a large-necked bottle, six or eight inches long filled with the same liquid. When he has his penis out, draw the bottle up over it and when he draws his penis into the sheath, it will cleanse the sheath. If you are careful and don't get the liquid too hot, the bull takes to it kindly. This also should be done just before the bull serves.—C. G. Penny, Sagadohoc Co., Me.

[Editor's Note: The principles of Mr. Penny's experience are indorsed by authorities, and we are glad to print his excellent results. We do not indorse his method of testing the strength of the disinfectant. There is too much variation in people's sense of taste. Furthermore, there is a chance for somebody to burn his tongue severely or dangerously in testing carbolic acid.

Carbolic acid is an excellent disinfectant. Any standard disinfectant will do as well, however. Creolin, for instance, is a much more powerful agent. Corrosive sublimate or bichloride of mercury in proper solutions are also recommended.

Other Cleansing Mixtures

No matter what disinfectant is used, remember that the solution is to come in direct contact with the mucous membrane and it must be weak enough to avoid injuring the membrane and still strong enough to do the work. A 1% solution of carbolic acid answers the purpose. This means that you use one part, by weight, acid crystals in 100 parts by weight water. Get your druggist to weigh the crystals out and tell you how many quarts of water to use for each dose. If you use bichloride of mercury dissolve 15 grains bichloride and 1¼ ounces copper sulphate in two gallons water. Use good clean water, preferably boiled first. figure out how much of the solution you are going to use and have the doses marked.

The germs of contagious abortion undoubtedly are commonly carried by the method described by Mr. Penny. They also enter the system through the mouth in infected water or feed, pass into the circulation and eventually cause the disease. General cleanliness and disinfection of the oarns and isolation of diseased animals are recommended in addition to the sanitary measures described above.

At Montana station Taylor found that carbolic acid either fed in solution or injected hypodermically acts as a preventive of contagious abortion. Cows will eat as much as 750 cubic centimeters daily of a 4% solution of carbolic acid. A hypodermic injection involves less labor than feeding it. It left no bad after effects, while the cows so treated carried their calves to the full time and bore healthy young, although previously infected. Internal carbolic acid treatment should, of course be attempted only under expert supervision.

Dehorning.

How would you suggest dehorning a heifer 15 or 16 months old? The horns are about 3½ inches long. Do they have saws specially for that purpose? If the saw is used, how close to the head should the horns be cut off? Would be make any material difference if she was with calf.—A. B. T.

Both the saw and clippers are used in the removal of horns. The former is the slower process and the pain is probably more severe because of the length of time required, but since the blood vessels are not smoothly severed less loss of blood is liable to follow its use. The head of the animal should be securely fastened in a rigid stanchion with the head held up by ropes so that the animal cannot thrash around. The saw commonly used in the jointing saw or a small meat saw. The clippers do the work with greater dispatch and are possibly more easily operated. Instructions as to their use may be secured from the manufacturers.

Whatever instrument is used, the cut must be uniformly made just under where the skin joins the horn or just below the tissue from which the sheil of the horn develops. The cut must not be too high or too profuse bleeding will result, besides a gnarly growth of horn is apt to appear. Cold water is the only dressing needed, although some prefer to apply a coating of tar. The animals may be dehorned at any time except in fly time or in zero weather. If the operation is done when flies are numerous they are liable to lay their eggs in the bloody wound and the cavities become filled with maggots, causing great agony to the animal. In extremely cold weather the animal may suffer from colds and catarrh as a result of the operation. It is much safer not to dehorn a cow a few months before calving, and it should be delayed until she has returned to normal after calving—Hoards.

When there is no head to the top of the Flour barrel, what do you know about the contents? Nothing!

But when you see that the top bears the "REGAL" label, you are sure you are getting good flour, which carries a money-back-guarantee of satisfaction that insures you against baking failures.

THE ST. LAWRENCE FLOUR MILLS CO., LIMITED
MONTREAL

Color and Fat in Milk.

Is not yellow milk always richer than white milk, asks a reader? Not necessarily. Sometimes very highly colored milk has a low fat content. The natural coloring matter of milk, cream and butter is derived from the feed. Experiments at the Missouri college have shown that the coloring matter of milk is identical with the yellow coloring matter found in plants and fresh grass. This matter is very abundant in the carrot.

In the winter unless feed containing this matter is supplied, milk is likely to be off in color, but it may be as high or higher in fat content. In fact, the average cow gives a higher percentage in winter than in spring and summer.

I. C. R. Business Back to Normal.

Government Railway Has Recovered Drop of Twenty Per Cent.

IMPROVEMENTS ARE MANY

Transcontinental Section is Also Busy and Promises to Produce Very Large Traffic

(Montreal Gazette, Nov. 6)

Mr. F. P. Gutellius, general manager of the Dominion Government Railway System, who is at the Windsor, stated yesterday that from a 20 per cent drop, the business of the I. R. C. had come back to normal, indicating a general revival in business all over the Maritime Provinces. The pasenger business is so good that the two daily trains between Montreal and Halifax will probably be kept on till after the holidays, whereas last year the Ocean Limited was taken off in November. Although little double track has been laid this year, ten thousand tons of steel have been laid on the main line, and Mr. Gutelius says that 20 per cent. of the main line is now laid with eighty-five pound rails and the remainder with 80-pound, the former being what is known as the C. P. R. standard, and the latter only differing from the maximum in the wearing capacity. As for the bridges between Montreal and Halifax, they are now all capable of carrying the heaviest locomotives in existence, and the roadbed all through is better than at any previous time in the history of the Government Railway. All this new steel has been put down out of earnings, and capital account has not been increased by any improvements. Much work has also been carried on during the past season between Truro and Sydney, the most important being a renewal of the bridge over the Grand Narrows, a short distance beyond the [illegible] Canso, Mr. Gutelius said that passengers going to Cape [illegible] member that when the weather was rough, the water would dash up against the bridge. To obviate this the new superstructure has been raised some six feet, making a very imposing and greatly improved structure.

The general manager says the I. C. R. is a different road from only a few years ago. At least half of the stations and other buildings have been painted this year, and the others will be finished next year. The number of trains running on time during the past season exceeds in percentage any other road on the continent. Heavy business is expected at the ports of Halifax and St. John during the coming winter. Mr. Gutelius expects that the mail trains will make a record this winter, as the ballasting has been improved, and the roadbed is everything that can be desired. The two biggest jobs on the Government Railway System are the ocean terminals at Halifax and the ferry system between the New Brunswick side and Prince Edward Island. The new station at Levis will also be carried to completion, and will be one of the finest stations of the whole line.

As the Government system now embraces the Transcontinental, Mr. Gutelius said that from the time it had taken over the road, or from the eighth of September on, no less than three hundred carloads of grain had moved over the road daily from Winnipeg to Fort William. The daily fast freight between Cochrane and Winnipeg is also well patronized and justifies the expectations of the department, as do the tri-weekly trains on other sections of the systems.

Mr. Gutelius says that a busy spot in the new north country is Amos, located about on the boundary between Quebec and Ontario. This community is receiving three or four carloads of settlers and their effects by each train, and with stores and shops of different kinds, there is a hustling

The Great British Remedy.

COUGHS THAT HURT

That kind of cough must be stopped, and at once; it is dangerous. The severe strain it causes may have serious consequences. You can stop it—and cure it—with the World-famous British Remedy, Veno's Lightning Cough Cure. There is nothing in medicine more quick or more sure than Veno's. That is why it is called a "Lightning" cough cure.

Awarded the Grand Prix and Gold Medal, International Health Exhibition, Paris, 1910.

Veno's Lightning Cough Cure is the most popular cough remedy in the whole world. Why? Because its a real cure, quick, sure, thorough; because it is free from every kind of poisonous or dangerous drug; because it is as good for children as for adults; because a better preparation could not be made, if the price were dollars instead of cents. Trust Veno's in the treatment of—

Coughs and Colds
Bronchial Troubles
Nasal Catarrh
Hoarseness

Price **30** *cents.*

population of over two thousand. Cochrane, he says, is also progressive, and Mr. Gutelius is convinced that the northern country served by the Transcontinental will be productive of considerable traffic in a few years, as business develops rapidly along a good railway system and no criticism can be made of the line in question. He saw the best quality of oats growing in the vicinity of Cochrane, and he is certain that the country adjacent will grow very rapidly.

Shelter the Implements.

Enormous sums are spent annually by the farmers of Canada for implements which, due to neglect, last on the average only half as long as they would if given proper care. To equip an average farm with machinery costs about $1,000. Implements subjected to the deteriotating effects of the weather will not do good work for more than five years. Thus there is necessary an expenditure of something like $2000 for each period of ten years. On the other hand, by protecting with suitable shelter, implements may be kept in use for more than twice the five-year average.

A comparatively cheap shelter will serve to protect the machines; one sufficiently roomy can be built for approximately $400, which should be considered as money invested, for it will realize a good dividend.

The following plan of a comparatively cheap shelter will meet the needs of the average farmer. It is capable of many modifications, and a careful study of the plan will be helpful to those who intend to build. Of course, the building can be made any length desired.

Plan...The building is 25 by 57 feet outside measurements. Concrete piers 12 inches square, spaced at frequent intervals, spport a six-by-six inch sill composed of two three-by-six pieces bolted to the piers. On this sill are placed two-by-six inch studs, which support a four-by-six inch plate composed of two two-by-six inch pieces. These studs are covered with one inch T and G boarding. The rafters are two-by-eight inches at 24 inch centres and are covered with one-inch sheeting and good cedar shingles, laid four and a half inches to the weather. The roof is strengthened by a truss spaced about ten feet apart. This truss consists of two two-by-ten pieces, starting from each side of a rafter and bolted together at the centre with a two-inch piece between them. Stock windows opening three feet by five feet are used. The sliding doors, which are built of V joint boarding with battens on the back, are equipped with hangers and track. The centre door slides on the inside and the others on the outside.—W. L. Graham, Field Husbandry Division.

Restoring Old Furniture.

M. R. T.—You must first remove all traces of the varnish and dirt by washing down the goods with strong soda water. Then follow with a thorough washing of clean water to remove the soda. Now bleach the work with a solution of oxalic acid, made by dissolving the acid in hot water. When this has been done, apply a thin coat of good copal or spirit varnish; allow it to dry, and apply a second coat of varnish. Be very careful how you handle the oxalic acid, and see that it is placed beyond the reach of children or animals, as it is a deadly poison. If all the acid is not used, the remainder should either be destroyed or labelled distinctly, as the powder has often been mistaken for Epsom salts, with disastrous results.

BOOK OF BARN PLANS FREE

If You Intend to Build a New Barn or Remodel an Old One You Should Have This Book

Louden Barn Plans is not a catalog of barn equipment. It is a complete and valuable book of reference and instruction on barn construction.

The 96 pages of *Louden Barn Plans* are full of dollar-saving information.

It contains 51 representative designs for cow barns, horse barns, combination and general purpose barns, as well as many other designs for hog barns, pens, hay sheds, chicken houses, etc.

In addition to the barn plans shown in the book, there are 32 pages devoted to general construction problems, such as concrete work, laying floors, roof construction, ventilation, etc.

When Writing for This Book Please State When You Expect to Build, and How Many Cows and How Many Horses You Want to House

We have designs for nearly 4,000 barns, and our architects will give your letter personal attention if we learn your exact requirements.

Louden Barn Equipment

Louden equipment makes possible a clean, sanitary barn with a minimum of expense. When cows are transferred from dark, dirty barns to Louden barns the milk flow often increases from 15 to 25 per cent, and the labor of caring for the herd is reduced from one third to one half. Louden equipment is just as great an economy for the man with a half dozen head of stock as for the man with hundreds of animals. The percentage of labor saved is the same.

The Louden Line of Sanitary Steel Equipment Includes:

Litter Carriers	*Cow Stalls*	*Water Basins*
Feed Carriers	*Horse Stalls*	*Cow Pens*
Milk Can Carriers	*Mangers*	*Calf Pens*
Harness Carriers	*Manger Divisions*	*Bull Pens*
Hay Carriers	*Feed Racks*	*Hog Pens*
Feed Trucks	*Hay Loft Equipment*	*Sheep Pens*

Agriculture, the True Basis of a Nation's Wealth

In other words, the Farmer is the backbone of the country, BUT, back of the Farmer is his wife, the true source of his individual wealth.

As Cook, housekeeper and full partner she requires the best appliances to help her save labor and avoid waste, and no housekeeper, however expert, can do good work with a poor stove. Unlike her city cousin the Farmer's wife cannot send to the corner store for cakes, pies and ready-made dainties if the stove "won't work." She must rely on her own kitchen equipment for all the cooked foods needed in the farm house. This is where the

ENTERPRISE MONARCH
STEEL RANGE

comes in, as an economical and reliable baker. With its large fire box for wood burning, heavy castings, extra large copper reservoir giving an ample supply of hot water, and every known device for accurate baking the

MONARCH is the range for the farm

WORKS WELL **WEARS WELL**
EASY ON FUEL **PLEASES THE COOK**

A Written Guarantee With Every Monarch Sold

Methods of Breaking.

It is evident that farmers are no exception to those who follow other professions in that the most valuable and definite knowledge they are wont to obtain is in the hard school of experience. So much of success depends on doing the right thing in the right place and at the right time in agriculture that every farmer can profit by observing the results of different methods. I learned a valuable lesson in the past two seasons in regard to the effect on the crop yield of different methods of breaking sod.

Two fields of similar land with a rod between the plots were broken the same week in June. The first was plowed three inches deep and left untouched until the next May when it was disced six times, well harrowed and sown with wheat. No rain fell of any consequence after sowing and the yield was ten bushels per acre of low grade grain, just 200 bushels from twenty acres. The other field of ten acres was plowed deeper, about four and one half inches, and was disced six times and harrowed four times within a week of breaking. It was then packed and left till May the next year, when it was harrowed and sown. Both fields had the same appearance after seeding. In the scorching weather during July the second field showed no signs of drought and on threshing yielded 230 bushels of No. 1 wheat, more than double what the other yielded per acre. Seed, soil, precipitation and workmanship were in both cases identical and the first crop failed not from a lack of plant food, but from lack of sufficient moisture to enable the plant to use that food. This was due to wrong methods of cultivation. I think more is lost each year by wrong methods and misapplied energy than through poor seed or weed pests. Since the results of poor breaking methods are seen for the next three years it is evident that ten acres done right is a better investment than double the acreage simply "broken."—T. W. W. in Grain Growers' Guide.

That Old Horse.

Yes, he has pulled the heavy loads in winter and cultivated the crop in summer. The family have driven him to the church every Sunday morning. The children have piled on his back and ridden around the fields and enjoyed it very much. He has been faithful to you and your family. To the best of his ability he has made himself valuable to you. The money he has made can not be told, for you have never kept an account of the worth of the horse; but for twenty years he has been worth from fifty cents to a dollar a day. Of course, he has more than paid you for his feed and shelter.

Well, what are you expecting to do with the old horse now? He is stiff in the joints and blind in one eye. He can not pull a load, and the children are grown and gone, so they cannot ride him about any more. Did you say you were going to trade him off or sell him to a peddlar? That would mean a hard time for the faithful animal. Surely you would not part with the horse that has helped you to pay for your farm, keep the family and rear the children. He has earned his right to a peaceable, quiet old age, with good feeds of grain and hay and the same warm stall. He has not failed you when he was strong, and you should not fail him when he is old and useless. Let him come in and lie down to rest on the same good bed of straw. And when he comes at last to the end of the journey, bury him beneath the friendly soil he has so often tilled for you.—W. D. Neale in Farm Journal.

FOR
HEADACHES, BILIOUSNESS
CONSTIPATION,

INDIGESTION

Nearly all our minor ailments, and many of the serious ones, too, are traceable to some disorder of the stomach, liver, and bowels. If you wish to avoid the miseries of indigestion, acidity, heartburn, flatulence, headaches, constipation, and a host of other distressing ailments, you must see to it that your stomach, liver and bowels are equal to the work they have to do. It is a simple matter to take 30 drops of Mother Seigel's Syrup daily, after meals, yet thousands of former sufferers have banished indigestion, biliousness, constipation, and all their distressing consequences in just this simple way. Profit by their experience. As a digestive tonic and stomachic remedy, Mother Seigel's Syrup is unsurpassed.

Bees.

Wintering in the Cellar.—In wintering bees in the cellar the aim should be to give them as much fresh air as possible without letting the temperature of the cellar drop below about 40° F. nor rise much above 45° F. Where fresh air is deficient the temperature should be kept down to about 40° F., but bees do better with an abundance of air in a temperature of about 45° F.—a combination hard to get in most cellars. The cellar must be dark and the air sweet, and neither very dry nor saturated with moisture; draughts should be avoided. Dead bees, if numerous, should be swept out in January, and again early in March. The bee-cellar should be partitioned off form the portion of the cellar containing roots; mice should be excluded, and the bees should be left undisturbed. If the bee-cellar is in the basement of a dwelling house the bees soon get accustomed to the tramping on the floor above.

Bring the bees into the cellar on a cool day in November as soon as reasonable expectation of another good cleansing flight has ceased and before zero weather sets in. To bring in the bees the entrance may be closed with soft paper, which should be removed as soon as the bees are settled in the cellar; the covers should be removed from the hives, and their places taken by bran sacks, two or three being folded double on each hive. To prevent dead bees accumulating and blocking the entrance, a space of one and a half inches to two inches should be left under the combs, with the entrance the width of the hive, and one or two inches should be left under the combs, with the entrance the width of the hive, and one or two inches deep, and the hives may be tilted behind.

Wintering Outside.—In many places where the winter is moderately cold bees are now being wintered outside in wintering cases constructed to hold four hives each, each pair of hives being placed back to back. There is a space of two or three inches between the sides of the case and the hives, and in the colder regions underneath also, and ten inches above the hives; all these spaces being filled with planer shavings or other insulating material. The bees are allowed to fly through small entrances made in the sides, and ventilation is provided under the roof which consists of light boards covered with waterproof sheeting. The bees will come to no harm if the entrances get buried under soft snow. For wintering outside, it is important that the apiary be well sheltered from wind by, for instance, evergreens or a high board fence.

Supplies.—The winter is the best time for the purchase and preparation of bee supplies. Frames should be made up and wired ready to receive the foundation. The beginner will make no mistake if he adopts the ten-frame Langstroth hive as standard, and prepares a good supply of extracting supers to take Langstroth frames. A telescoping hive-cover packed with excelsior or shavings and covered wtih waterproof sheeting is better than a plain cover made of a single thickness of board, as it helps to conserve the heat in spring and to protect the bees from hot sunshine in summer.

Empty Combs.—Next to the bees, the most valuable asset of the extracted-honey producer is a plentiful supply of good, clean, empty combs. Empty combs should be stored for the winter in the supers, which should be tiered up with newspapers between each, and a cover on top to exclude mice. To prevent the wax moth from working in the combs they should be kept in a cold place.—F. W. L. Sladen, Apiarist, Ottawa.

Ventilation in the Root Cellar.

Lack of proper ventilation in the root-cellar is responsible for the loss of considerable quantities of stored potatoes, carrots, roots and vegetables. A safe root-cellar is frost proof, and is provided with good ventilation to keep the roots or potatoes from rot or decay. Care should be taken not to place in storage bruised or damaged roots or potatoes, as such are likely to cause storage rots. Keep the root-cellar as cool as possible, but free from frost; the most satisfactory temperature is about 35° F. to 40° F.—H. T. Gussow, Dominion oBtanist.

Apply Hen Manure as Made.

My henhouse floor is littered 10 inches deep with leaves in which the hens are obliged to scratch for their feed, which is corn, wheat and oats. This breaks up the leaves quite fine and with the pulverized litter the dropping board is covered four inches deep when the house is cleaned once a week. The manure is applied to the fall-plowed garden, where early vegetables will be grown next spring.

Mixed with the fine litter the droppings can be evenly spread and the winter rains soak the manure into the ground where it is available for the plants, giving them an early start. I followed this plan last winter and had ripe tomatoes two weeks before any of my neighbors. From four rows four rods long I sold $16 worth at 12 cents per pound.—E. P. Snyder.

Near State Capital.

75 Acres Equipped, $2500.

The most fascinating of all sports

Trap-shooting! The "sport alluring"! The *one great* out door game that appeals to everyone—men and women—young and old.

It's full of interest and excitement and with a little practice transforms the "couldn't-hit-a-balloon" amateur into a "crack shot."

Everywhere in Canada, trap-shooting clubs are springing up. If there's one in your town, join it. If not, let us help you to start one.

Get the trap-shooting habit. Also get the habit of shooting Dominion Shells, which are used by more Canadian trap-shooters than all other makes combined.

The reason is simply "all round dependability"—the result of first class materials, a well equipped factory and workmen of the highest skill.

Look for the "Big D" on every box of Dominion Shot Shells and Metallics. It's a guarantee of perfection.

Dominion is "the ammunition made wholly in Canada", and sold everywhere.

Any trap-shooting information will be gladly supplied free upon request. Address:

Canning Old Fowls.

When the price offered for the surplus cockerels and old hens is not satisfactory they may be easily canned. The fowls should be prepared, cooked and cut into pieces that will pack well in a five-pound lard pail. Then cover the meat with melted lard. The housewife will find a few dozen cans of chicken meat very handy for Sunday dinners when company drops in.—A. S. Woods, New Jersey.

KENTVILLE POULTRY YARDS,
KENTVILLE, N. S.

CLOVER HONEY!!

We offer a superior grade of Clover Honey in Comb, in jars and pails holding 5 pounds and 60 pounds. Prices given on application.

CRAIG BROS., - Amherst, N. S.

WYANDOTTES
GOLDEN AND SILVER

Splendid exhibition Cockerels and Pullets—a large number—in both varieties for sale at right prices. Send for one or more of the kind that can win at The Maritime Winter Fair next month

EVANS KYLE
Magnolia Avenue Poultry Yards
SUSSEX, N. B.

HORSE FOR SALE.

A Handsome Black Gelding, fearless and kind, with lots of speed, (trotter), a good show horse and a nice roadster, safe for a lady. Apply to

MRS. A. M. WILSON, Erskine, Dartmouth, N.S.

FOR SALE

20 S. C. R. I. Red Cockerels at $2.00 each. 20 S. C. R. I. Red Pullets at $2.00 each. Also a few R. C. R. I. Red Cocks, Hens, Cockerels and Pullets.

W. H. Henry, - Shubenacadie, N. S.

Advertise in The Maritime Farmer and get results.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

FOR SALE—Oxford Down Rams. All ages.—J. W. MacDONALD, Lovat, Pictou, N. S.

FOR SALE —Registered yorkshire boars, eight months old. STEWART BROS., Murray River, P. E. I.

FOR SALE.—Pure Bred Yorkshires, one Boar, six months old, also several pigs. FISKE BROS., B. S. A., Florenceville, N. B.

FOR SALE.—Pure Bred S. C. White Leghorn Cockerels, Rancocas Strain, price $1. H. A. CHURCH, Petitcodiac, N. B.

LIVE FOXES FOR SALE.—One pair of Silver Black's and two pairs of Crosses, all ranch bred. C. G. HOWARD, Milton, P. E. Island.

FOR SALE—Pure Bred Berkshires. A few sows fit to breed this winter. JAS. W. MACBAIN, Meadowville Sta., N. S.

WOULD YOU MARRY IF SUITED?—Best Matrimonial paper published. Mailed FREE.—THE CORRESPONDENT, Toledo, Ohio.

"PORTRAIT AGENTS WANTED.—Send for catalogue. Solar and bromide prints, portraits flat and convex, frames and war pictures. MERCHANTS' PORTRAIT CO., Toronto.

FOR SALE.—Purebred Yorkshire Pigs Three Boars, six months old. Apply to AUBREY CAMERON, Lyons Brook P. O., Pictou Co., N. S.

FOR SALE.—Pure bred Jersey Heifers ages five weeks to three years. Two freshen first of January. Terms reasonable. G. B. CLARK, Tatamagouche, N. S.

FOR SALE.—Four Ayrshire bulls fit for service; males and females all ages. One Yorkshire boar, seven months, one, two years Also Clydesdale horses stallions and mares. JOHN A. HUGHES, Petitcodiac, N. B.

DRESSED PORK 100 to 250 lbs. each well fatted. Butter prints and tubs. Eggs 3 to 10 case lots, prompt returns. JOHN HOPKINS, Mfgrs. of pork products, St. John, N. B.

YOUNG PIGS FOR SALE.—Purebred Berkshires, registered; Purebred Yorkshires, but not registered. Also Berkshires and Yorkshires crossed.—R. O'LEARY, Richibucto, N. B.

WANTED—LADIES TO DO PLAIN and light sewing at home, whole or spare time, good pay; work sent any distance; charges paid. Send stamp for particulars. NATIONAL MANUFACTURING COMPANY. Montreal.

REGISTERED JERSEYS FOR SALE.—Bull, eighteen months, from heavy milking dam, guaranteed sure; cow, six years, cow, two years; heifer, one month. Fresh cows a specialty. WALTER LANGILLE, Tatamagouche, N. S.

GUERNSEY BULLS FOR SALE.—One seventeen months; one eleven months. Also young calves, after our imported bull, out of Record of Performance cows.—D. G. MacKAY & Son, Scotsburn, N. S.

JOIN THE VETERINARY SCIENCE ASSOCIATION—The greatest organization for farmers and stockmen in the world. A membership means hundreds of dollars saved. Each member has the privilege of reduced prices in medicines and consultations, and advice on all veterinary matters free of charge. These privileges alone are worth many times the membership fee. Beside this each and every member receives a complete Course of Instructions in the Veterinary Business. The Course of Instructions, entitled "The Veterinary Science," is a large book containing nearly 700 pages, profusely illustrated, durably bound and it is equivalent to a thorough practical course in a veterinary college. The membership is for life and the regular price is $5.00. But for a short time only, in order to introduce these valuable memberships and secure agents, I will send the book and certificate of membership postpaid for $3.00. Send today and save $2.00 as this special offer may not appear again.—C. M. ROBINSON, General Agent, Riverside, Albert Co., N. B.

Fall Clearing Out Sale

First prize Registered Holstein Bull over two years old, $100

Two Registered Yorkshire Sows over 7 months old, best bacon type at $18 each

20 Big Barred Rock Hens, $1.25 each; Roosters, $2.50.

20 Beautiful Pure Bred White Wyandotte Hens, $1 25 each; Roosters, $2.50.

Massey-Harris Root Cutter, cost $15, price $7.00.

Mixed Breed Hens from free range, soon laying, 75 cents each.

J. S. GIBBON,
East Riverside, Kings Co., N. B.

Percheron Stallion
GLENEUR
FOR SALE!

The Imported Percheron Stallion Gleneur has stood for service in and around Sussex for five seasons, where his get are in demand at the highest prices paid for draft horses in this vicinity. He must now be sold in order to make room for another horse to mate with his fillies. His get are active, trappy fast walkers and great workers.

Gleneur is a dappled grey, weighing 1750 lbs., is nine years old, gentle and a sure stock getter. Guaranteed sound in wind and limb. If you want to buy a stallion that will improve the quality of live stock in your district and prove a good investment for you, make inquiry about Gleneur before you place your order elsewhere,

Wm. Jamieson, - - Sussex Corner, N. B.

PISGAH PLACE

I have volunteered for Overseas Service and am selling my entire stock of purebred

Ayrshires, Clydesdales and Yorkshires
Also all Farm Machinery

The sale will take place on

Nov. 30, 1915, at 1 o'clock, at the Stables.

Parties will be met at the station. Write for catalogue

H. F. Ambrose, - Stewiacke, N. S.

R. O.M. and R. O. P. Holsteins

Would you like to get a good foundation? Holsteins of this calibre are seldom offered at any price, but we are overstocked and will offer::—

2 Daughters of "Ruby Nig" whose 7 day record is 567 lbs. milk, 25.60 lbs. butter; yearly record, 16,555 lbs. milk, 750 lbs. butter; the second highest record in Canada at 3 years of age.

2 Daughters of "Black Rose Beauty" whose record is 522 lbs. milk, 24.60 lbs butter in 7 days.

2 Daughters of Miss Rooker Posch, whose record is 402 lbs. milk, 16.114 lbs. butter in 7 days; 12,268 lbs. milk, 600 lbs. butter in one year, when 3 years old.

2 Daughters of Beauty Rooker, whose record at 2 years of age is 322 lbs. milk, 15½ lbs. butter in 7 days; 11,248 lbs. milk, 517 lbs. butter in one year.

And several others of equal breeding, sired by or bred to "Ida Rooker 2nds Vale," a sperior animal in every way and a proven producer of rich milkers. Also some extra nice bulls of the above breeding, all at reasonable prices.

LEA & CLARK, Victoria, P. E. I.

ELMHURST SHORTHORN STOCK FARM

Present Offerings—Six exceptionally good red and roan bulls, 10 to 18 months of age, from superior milking dams. Write me for prices and particulars before placing your orders elsewhere.

C. C. H. EATON, - - - - CANARD, N. S.

HOLSTEIN BULLS AT BARGAIN PRICES

Two pure-bred, but not registered. Holstein Bulls. 16 and 18 months old. in excellent condition, fit for service. Just right for farmers who have only grade herds and wish to improve. These bulls will be sold at bargain prices. Write quickly if you want one of them.

A. HECTOR CUTTEN, - Inglewood Farm, Lower Truro, N. S.

COBEQUID FARM HOLSTEINS

ATTENTION.—We can supply anything you want in Holsteins, young Bulls from 1 to 15 months old, Cows and Heifers, fresh or to freshen soon, yearling Heifers or Heifer Calves. We intend showing at the Amherst Winter Fair and will be pleased to meet our old customers and anyone interested in Holsteins there. Write your wants to

S. DICKIE & SON, - Central Onslow, N. S.

Volume 21. SUSSEX, NEW BRUNSWICK, DECEMBER 7, 1915. Number 5.

Grading Seed Grain a Profitable Stormy Day Job

December is here. The fruits of the field, garden and orchard have been garnered. Frost and snow have begun to continue the preparation of the soil for next season's crops, where the farmer's plow and other implements of cultivation left off. There is nothing very much that the farmer can do in his fields until the hot spring sun thaws, dries and warms the soil that will help to produce a bumper crop in 1916 except the conservation, hauling and distribution of manures and the application of Slag and Ground Lime, one or all of them.

Many of the Maritime Farmers readers, with the coming of the frosty weather, are busily engaged in preparing their supply of fuel in the woods so as to have it ready to haul as soon as the ground is sufficiently covered with snow for good sleighing. They have long since learned that they can work to better advantage while the woods are free of snow. It is easier and cleaner to handle the wood when it is dry. It may be cut with a minimum wastage for stumps and one can lay out his roads to better advantage before the snow arrives.

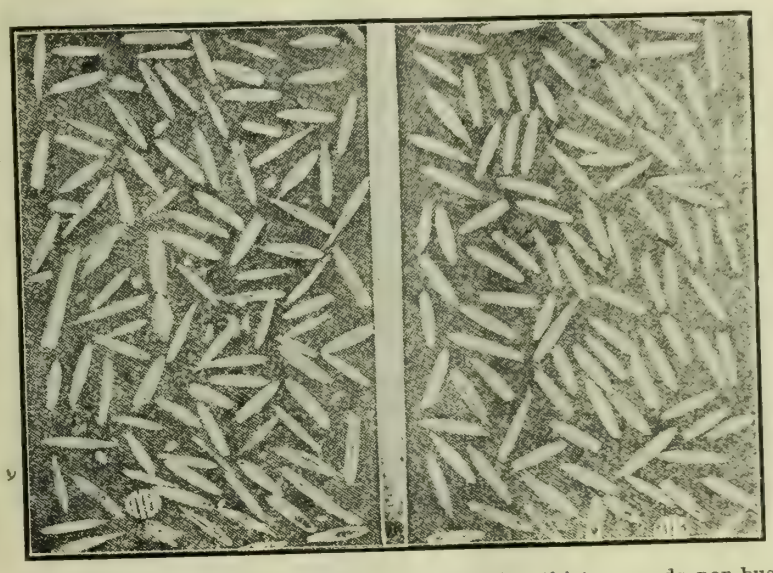
Others may be planning to do a little logging. In some sections the gathering of sea weed and the digging and hauling of alder muck and mussel mud for fertilizing purposes, is the order of the day. One or all of these operations will be performed in the various sections of the Maritime Provinces to fill in the time not required for chores and the care of the livestock. The fruit growers will be busy in their orchards cutting off a limb here and a branch there to facilitate the entrance of the suns rays to the most innermost recesses of each and every treetop as a sort of guarantee for red, rosy apples next fall.

Occasionally we have days when the weather is too disagreeable to work out of doors and not infrequently we hear farmers bemoaning the interruption to some line of work they had in hand. The careful farmer is seldom if ever chagrined by a wet day. He has always some job set aside to occupy his hours profitably on a stormy day.

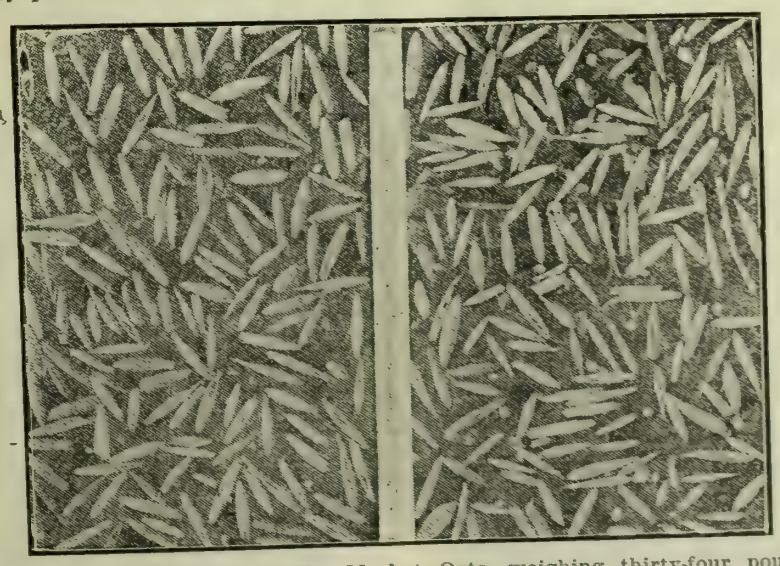
There is no more profitable operation that a farmer or his men can perform at this season of the year than by spending a day or days, if need be, in grading his grain to get the best and plumpest portions of it put aside for seeding purposes next spring. This is a class of work that may be performed to the very best advantage on stormy days. There is no work on the farm, done in rain or shine, that will give more remunerative returns than the proper grading of seed grain.

By all means it is a task that should not be delayed until you have fed out the best of your grain or until the grain in the bin is getting low. Do it while the fruits of your harvests are still intact. Use your fanning mill. Feed it slowly and run it fast and you will be rewarded with a nice sample of plump, heavy grain at the seed grain spout.

The cuts on this page have appeared in former issues of the Maritime Farmer. The story they tell is ever new and as this is the time of the year when the work they depict should be attended to we publish them again and trust they and the article that accompany them may be the means of starting some one who has never done so before to pay particular attention to the timely grading of his seed grain.



On the left, a sample of Original Oats, weighing thirty pounds per bushel. On the right, a sample of the Five and One-Half Pounds, weighing thirty-eight pounds per bushel, graded from the above fifty pounds of oats, weighing thirty pounds per bushel.



On the left, sample of the Market Oats, weighing thirty-four pounds per bushel. On the right, sample of Tail Oats, weighing twenty-seven pounds per bushel, that can be used for feed.

Some Reasons Why.

Crop yields are determined principally by weather conditions and the kind of seed planted. Of these three general factors, the last is most nearly under our control. Nevertheless, millions of dollars are lost directly every year through planting poor seed and the foundation is laid for endless trouble and loss by sowing impure seed and spreading broadcast on the fields the seeds of noxious weeds. Sow pedigreed seed if you can get it. At any rate, sow the best seed that you can get.

Test a fair sample, taken from various parts of the lot, for germination. Use the fanning mill with a good strong blast to blow out the impurities and light kernels. Repeat the process until you have removed all light seeds and weed seed and then rigidly grade what you have left. Sow only the plump, heavy well-developed kernels.

No law in nature holds so generally true as the old maxim that "like begets like," and while there are many factors dealing with the performances of individual plants that enter into the final results of seed selection, there is no doubt that rigid grading of grain much more than pays for the work involved. Thriftier plants are produced and naturally they yield better.

Crop authorities agree in advising the elimination of light and immature kernels from the grain seed. It must neverthless be admitted there is little positive data on the subject of increased yields from very heavy seed grain. Tests with wheat extending over several years show little or no direct advantage. At some stations increases in yield and quality have been noted. German investigators, however, 75 years ago, proved beyond question the undoubted profit of rigid seed grading. Plump heavy kernels have the vitality and stored-up plant food needed to give the young plant a vigorous start.

The livest and most successful body of seed growers in the United States is found in Wisconsin, where the graduates of the state agricultual school are banded together under the name of the state experiment association. Every man is a breeder and grower of pure seeds. Their products have swept the boards clean on small grains at all of the great national corn expositions. It is significant that these men, without exception, use the fanning mill vigorously and repeatedly, and then use the grain grader, taking out from 15 to 40% and sowing only the plump heavy kernels. They are a unit in approval of grading.

Some organizations in Canada are working along similar lines and are meeting with the very best success.

The weed problem is yearly becoming more serious and the losses to agriculture on this account exact a heavy toll from the farmer. On the grounds of purity alone, the expense and labor of cleaning the grain is more than justified.

The following table shows strikingly the range of direct loss due to weed seed in wheat:

Wheat Inspected at Winnipeg

Year	Cars Inspected	Cars Rejected	Pct. Rejected
1904	37,902	603	1.59
1905	61,582	2441	3.96
1906	68,315	4659	6.82
1907	50,845	912	1.79
1908	52,395	1518	2.89

Out of each bushel of wheat inspected by the Minnesota grain inspection department in two years, the average dockage was 19 ounces, very largely due to weeds. Minnesota produces annually about 200,000,000 bushels small grain. This means that had the land been free of weeds the same amount of plant food, moisture and labor would have produced over 3,000,000 bushels more wheat or its equivalent.

This makes an annual loss due to weeds of over $2,500,000 in that state. To this must be added loss of labor in fighting weeds, loss of fertility in moisture, extra cost of binding twine to tie up the weeds and freight charges for shipping the weed seeds. Cleaning seed grain insures the farmer against deliberately sowing his fields with weeds.

Smut damage in small grains is at times extremely serious. It can be entirely eliminated by treating the seed with the formalin solution. This can be done conveniently when the grain is graded and fanned.

Concrete results from the planting of good seed—pure-bred, of high germination test, cleaned and graded——have been compiled from reports submitted by the several hundred members of the Wisconsin association. The following table shows the increase in the yield from pure seed over the average yield from common seed in Wisconsin:

Five-Year Average

Crop	Increased yield p. acre.
Barley	6 bushels
Oats	9.2 bushels
Rye	8.7 bushels

In many cases a poor catch of grass seed or failure of small grains to grow is due to low vitality of the seed rather than to soil and weather conditions usually blamed. Of course with small grain, seed of lower test may be used than with corn, because it may be sowed thicker, but poor seed under any circumstances is a losing venture.

A sample of oats recently examined by the state seed inspector of Wisconsin showed a germination test of only about 30%. The appearance of the grain was excellent, but due to improper storage it had heated in the bin just enough to kill many of the germs without greatly injuring the appearance of the grain.

Six times in succession, grand championship honors for the world's best barley have been awarded to H. E. Krueger, of Dodge county, Wis. Mr. Krueger not only uses pedigreed seed that he has bred up with great care, but cleans and grades rigidly. "Couldn't afford not to." he says.

At the Manitoba experiment station a series of test results that have not been published showed wheat yields in direct proportion to the weight of seed used. Four different grades as to weight and plumpness were used in sowing the test plots.

All points considered, a profitable thing to do—in fact, the only safe thing to do—is to clean, grade and test all small grain seed as well as seed corn. The fanning mill and grader are within the financial reach of every farmer and should be made part of the regular farm equipment.

Testing for vitality is so easy and yet its results so far-reaching that no grain grower can afford to neglect it.

Progress of Rural Science in Nova Scotia

L. A. DeWolfe, Director of Rural Science
Truro, N. S.

Through increased government aid, Rural Science has, during the past two years, made very encouraging progress in Nova Scotia.

The quality of work done at the Summer School in Truro has improved; and, consequently, the improvement is carried to the rural schools by enthusiastic teachers. The number of teachers attending the summer school has increased each year. Last summer, the attendance was 160.

At this school the teachers get actual practice in gardening and conducting exhibitions. In their own schools, therefore, such work is not new.

The accompanying "cuts" illustrate the work done during the session of 1914. That year, we planted and cared for gardens on three vacant lots in the town of Truro. Figure 1, is a photograph of the student-teachers working on one of these lots. We also conducted garden operations on the Alice Street School grounds and the Bible Hill School grounds. Figure 2 shows the student-teachers working with the school children.

For demonstration work, a well-kept garden, occupied one corner of the Normal College grounds. All our students got some practice in this garden. It is shown in Figure 3.

Believing that the school exhibition is the natural sequel to the school garden or home garden, we hold each year in Truro a model exhibition. Here are exhibited the products of the students' handiwork during the year. Figure 4 shows a view of the one held in 1914. In 1915 we held two such exhibitions. One was in June when all regular Normal students could have a hand in the proceedings. The second was in July, when the summer students got their introduction to such work.

Fig. 1.—Student-Teachers Gardening on a Vacant Lot, in Truro, N. S.

As a result of these model exhibitions, very many teachers now hold local exhibitions or send exhibits to county or district centres. Figure 5 shows a one-school exhibition at Mahone Bay; and Figure 6 a similar one at Amherst.

Besides exhibitions conducted by the Rural Science department, such organizations as the Woman's Council have done much to make gardening popular. The exhibit shown in Figure 7 was the first one in Truro under the management of the womans' council.

All these photographs illustrate the work of 1914. In 1915 many exhibits were big improvements on those of the previous year. But no "cuts" of these have yet been made. All our out-door operations are not in the garden.

School gardens, as such, have not proved entirely successful. In most cases the neglect during the summer vacation proves fatal.

Home gardens, however, have been popular. Their value is undisputed, and their success has been encouraging.

In the summer of 1914, seven hundred children made gardens at home and seventy schools exhibited their produce. In 1915 nearly two thousand children had gardens, and one hundred and sixty schools held exhibitions or sent exhibits to near-by centres.

With such an increase as this, we are justified in believing that gardens and exhibitions have now become a permanent part of school work. Furthermore, this work is voluntary. It, therefore, has much more value than will the compulsory traditional subjects of our public school curriculum.

Our most enthusiastic teachers are carrying on this work with so much energy and giving such cheerful cooperation that we are sure Rural Science is now established on a permanent basis. Its future is in the hands of teachers who will see that nothing shall itnerfere with its progress.

A sheep breeder in Vermont has a Rambouillet ram that weighs 325 pounds and sheared 35 pounds of wool. The wool was sold for 30 cents a pound —$10.50 worth of weaving material from that one ram. "Can anyone beat that?" asks the American Sheep Breeder. Sure! R. C. Harvey, of Raymond, Alberta, has a Rambouillot ram that weighs up around 350 pounds and sheared 37½ pounds of wool this past season. The fleece sold for 28½ cents a pound, a net return of $10.54½. Alberta beats Vermon for sheep.

Fig. 5.—A One-School Exhibition at Mahone Bay, Nova Scotia.

The P.E.I. Fields of Standing Grain Competition

There were two hundred and sixty-two entries in the Fields of Standing Grain Competition this year, of which one hundred and thirty-four were in oats, one hundred and seven in wheat, and thirty-one in barley. The excessive rain in the spring and early summer injured the grain crops in some sections, and lessened somewhat the number of entries in West and Middle Prince.

It is worthy of notice that among the many varieties of oats formerly grown in this Province, Banner and Old Island Black have far out-distanced all others in popularity.

Some Marquis wheat is grown, but White Russian and White Fife are the staple varieties. There is not as yet the same unanimity of opinion regarding the best varieties of barley.

The judges were again instructed to secure, in addition to the usual information, the number of bushels of seed grain of good quality each exhibitor might be expected to have for sale, in order that the best possible market might be secured. This department is now prepared to give intending purchasers the names and addresses of parties who grew large quantities of grain of the different varieties, true to name, and free from admixture of noxious weed seeds or of other garins.

The judges were: For West Prince, Michael Coughlan; Middle Prince, Michael Coughlan; East Prince, Richard Creed; West Queen's, W. J. Reid; Middle Queen's, Theodore Ross; South Queens, W. R. Reek; West King's, W. R. Shaw; South King's, Walter R. Shaw; East King's, Michael Coughlan.

Judge's Remarks—West Prince

The wheat was above the average. There were a few exceptionally good fields. White Russian was the favorite variety. The Oats, however, were below the average, being thin and short and lacking in uniformity. Old Island Black is still a favorite variety. Many fields of wheat showed evidence of insect injury caused probably by the Wheat Stem Saw-fly.

Middle Prince

The Oats were a little below the average, with a few exceptionally good fields. Banner is the favorite variety in this district.

The Wheat was not very good, as it lacked in stand and a number of fields contained noxious weeds. Insect injury similar to that of West Prince was also in evidence.

East Prince—Judge's Remarks

There were thirty entries for oats, sixteen for wheat and four for barley. Most of the fields entered were free from other varieties and other kinds of grain.

All the oats entered were Banner and the greater part was from hand-selected seed. The oat straw in many sections was affetced by a decay just above the third joint, and owing to some high wind storms many of the fields of oats were very badly broken down. The grain was rather thin.

The wheat crop was excellent. There was some weevil present but not sufficient to lessen the yield materially.

The competition in barley was not very keen but the first prize field was of a high standing.

Perennial Sow Thistle and Canada Thistle were found quite generally over the whole district.

Smut was found in all the fields that were not treated; especially was this the case in wheat.

West Queen's—Judge's Remarks

The number of entries from West Queens was low when compared with a report of the same area for 1914. This can be attributed to the lateness of the season and the uncertainty of the crops in many instances.

The oat crop, for which there was thirteen entries, showed a marked lack of uniformity. Fields grown on the high land showed a superior stand and prospect of yield than those on the low areas. Smut was prevalent where treatment of the seed had been neglected or only partially done but rust was only in evidence on a few occasions.

Wheat will not make as high an average as last year. The possible cause is the lateness and excess moisture of the growing season. Many fields showed a large number of heads only partially filled.

There were few entries for barley as it seemed to be the most affetced by the season, and incident causes. The stand and yield of the crop will be average.

The weed crop was the cause of some otherwise excellent fields of grain receiving a comparatively low score. Such weeds as Perennial Sow Thistle, Wild Vetch and Couch Grass, are worthy of the most noxious characteristics and should be treated as the embodiment of such. In many instances these weeds could be followed from one farm to another in seed grain except where extreme care had been given to cleaning.

Middle Queens—Judge's Remarks

In Middle Queen's the grain crops were good and the competition in wheat and oats exceptionally strong. All the wheat was White Fife except two fields of Marquis and one of Red Fife. Marquis ripens earlier than other varieties but does not seem to be increasing in popularity. The field of Red Fife was particularly good, but had in it some bearded wheat and a little barley. There was one field of No. 72 oats, one of Ligowo and one of Norway. All the remainder were Banner.

Weeds were not nearly as prevalent as might have been expected. Sow Thistle and Canaad Thistle were most abundant, and Wild Buckwheat. Yarrow and Nettle also did some damage.

The importance of treating seed grain with formalin was evident. A few treated fields showed some evidence of smut, but in some untreated fields the loss from it aws considerable. There was practically no damage from rust.

SOIL CONSERVATION

"Unto everyone which hath shall be given; and from him that hath not, even that he hath shall be taken away from him."

Like many other scriptural expressions the above does not mean exactly what it says. It certainly would not be possible to take something from nothing, although it would be possible to give to a person who already had. As applied to soil and soil culture, however, the quotation continually comes to the mind of a person who has worked much with growing things. A lean or worn out soil will not grow much of a crop and those who have had experience know very well that a run down soil is a very difficult thing to build up and put into good condition for fair crops. The leaner and poorer the soil is, the greater the tendency to become still more impoverished, and necessarily, the poorer the crops secured. In other words, "from him that hath not, even that he hath shall be taken away from him."

On the other hand, with a soil which is in good tilth and well filled with humus and the necessary chemical elements, it is indeed easy to maintain the state of fertility unless unusually exhausting crops are grown. This does not mean, however, that due diligence and care should not be exercised in maintaining the state of fertility as once on the down hill grade the arresting of the depreciation is difficult. A liberal supply of humus or decaying vegetable matter is the most important factor in keeping up of soil in condiiton for securing maximum crop yields. If the soil is well filled with humus the necessary chemical elements may be supplied in the form of commercial fertilizer in proportion to the rapidity with which these elements are removed by the particular crop grown. The maintaining of humus is a very easy matter in soil which is already well supplied. In fact the tendency with some crops is to increase the humus content of the soil rather than diminish it. Soil rich in humus and otherwise in a fertile condition everyone knows will give big crops. In such cases "Unto everyone which hath shall be given."

Poor soil tends to produce smaller crops and rich and fertile soil, if well handled, tends to produce larger crops.

INCREASED DEMAND FOR QUALITY

Scarcity and high prices are not making room for inferior quality in animals, or in anything else produced on the farm. In fact, the demand is becoming more exacting as to quality and condition. This feature in trade is due to education more than scarcity. People are becoming better judges of the things they use and the articles they deal in. Education and instruction along all lines in the necessities of life are being discussed and published in a way that is helping people to an understanding that they never before had.

The public school is teaching agriculture in all its varied forms, so that the boy or girl of the public school has a better technical knowledge of soils, crops, etc., than the old pioneer farmer, though, of course, we must concede him, from a practical standpoint, in the lead so far as his skill of doing and operating is concerned.

The old admonition, "Breed better stock, keep better sires," is not so much in demand now as a few years ago. This may be explained by the force of education that has been constantly exerted, and intelligently, too, in the interests of pure-bred stock. The buyer of a bull at the present time is anxious about quality and good breeding. He is not content with a common animal just because he comes cheaper in price. The price is not so much a matter of consideration as the quality This disposition expressed now is to get better stock and improve it. Very few farmers of this period feel comfortable under the realization that their new bull is not getting a much better lot of calves than his predecessor.

While the duty of every publisher in the land is to preach improvement in live stock and better farming, the general tendency is to absorb what others 'round about are doing when the evidence plainly reflects better methods and better results. A realization of this is all that is necessary to prompt better seed, better growth, better stock and the realization of better profits.

PRIDE IN THE HORSE

A reader of the Breeders' Gazette, visiting in Denver, writes that a splendid pair of heavy harness horses drove up to the door of his hotel as he was standing there. When he remarked that it was a fine pair the hotel proprietor said that his wife bought all her goods of the store to which these horses belonged because she liked to see them drive up to the door. The horses were fitted out with attractively mounted, well polished harness and hitched to a handsomely painted attractive delivery wagon, making altogether a very distinctive appearance.

Many a city woman's heart beats with pride to see a turnout of that character stop at her front door. It has a great advertising value. Just to have the store's name linked with such a high-class delivery is worth much; to have those horses stop before their doors is worth more. It brings trade. This principle is well understood by successful merchants in large cities. The famous turnouts of Chicago department stores have been maintained, like those of Denver, for their advertising value.

Certainly the pride in the horse is a natural human impulse. No mechanical turnout can be quite so beautiful, distinctive or fascinating. We shall always like horses and want to see them. There will always be rivalry between horsemen to see which can own the best and present them to public view in the best form. Carriage makers report a substantial increase this season in the demand for horse-drawn vehicles. The number of heavy harness horses seen on the streets, especially in the east, seems to have increased. For several years the saddle horse has been gaining steady popularity for city pleasure purposes. The pride in the horse is largely responsible for this permanent esteem of turnouts and pleasures in which the horse is a factor.

FARM VALUE OF THE PASTUE

The farm value of the tame grass pasture on the farm is forcing its claim upon the attention of land owners as the native grass sod weakens and deteriorates under the influence of the continuous cropping by the grazing animals. The habit of overstocking is a prevailing fault on most farms, and the tendency of weed growth to take the advantage of these weakened and impoverished pastures is a feature that all observing farmers recognize as an inevitable result.

The civilizing influences of cultivation means the displacing of the native grasses and the establishing of improved tame grass meadows and pastures, with the varieties best suited to the soil and climatic conditions of the country. The reseeding of these lands to native grasses is not practicable, and the resting of the pasture for recuperation under natural influences is out of the question, as the farm requirements demand the use of all the acres in growing crops.

Farm lands in all agricultural districts are rapidly acquiring a value for crop purposes that demands the greatest possible attention in economical cultivation. It is no longer profitable to grow the wild grasses on the farm, except in meadows and where the lands are too wet for cultivation.

The pasture is now one of the most important and valuable crops the farm produces. The hay crop and the pasture crop, or what is termed the grass crop, is producing more wealth than any other crop.

NOTES

The English and Germans recognized more than a hundred years ago the necessity of keeping nature balanced by encouraging bird life and holding insect life in check.

Most accidents can be prevented, but what is each one of us doing to prevent accidents? We must not expect that care will be taken for our safety and never take thought for that of another. —Bulleting Ontario Safety League.

"Amortizing" Farm Mortgages

If one has a correct understanding of the meaning of the term it will be easier to undersand the meaning of the plan. We borrow the word from the French infinitive "amartis," meaning to extinguish. The amortization plan of borrowing money and extinguishing the debt is to pay interest and a small part of the principal every year until the debt is extinguished. There are many so-called amortixation plans of loaning money, but the true amortization provides for a certain payment every year until the debt is extinguished. A debt of $1,000, with interest at 5 per cent, and 3 per cent payment on principal, will be extinguished in twenty years by paying $80 a year. A 5-3 per cent payment will work out as follows if we make a payment of even $80 each year but the last, when the payment will be $88:

No.	Int.	Prin.	Tot'l.
1	$50.00	$30.00	$80.00
2	48.50	31.50	80.00
3	46.93	33.07	80.00
4	47.27	34.73	80.00
5	43.53	36.47	80.00
6	41.71	38.29	80.00
7	39.80	40.20	80.00
8	37.79	42.21	80.00
9	35.67	44.33	80.00
10	33.46	46.54	80.00
11	31.13	48.87	80.00
12	26.12	53.88	80.00
13	26.12	53.88	80.00
14	23.43	56.57	80.00
15	20.60	59.40	80.00
16	17.63	52.37	80.00
17	14.51	65.49	80.00
18	11.24	68.76	80.00
19	7.80	72.20	80.00
20	4.19	83.81	88.00

By paying a few cents more than the $80 the payments will be the same throughout the term. To find the amount of payment to be made when the rate is the same on other sums multiply the sum by each of the above items. If the interest rate was 6 per cent, and 3 per cent of the principal be paid every year, the debt will be extinguished in nineteen years.

The same percentage of principal being paid in all cases, the higher the interest rate the quicker the debt will be extinguished, while the lower the interest rate the longer it will take, on the basis of a payment being equal to the sum of two rates.

If $80 be paid annually in all cases on a debt of $1,000, the lower the interest rate the quicker the debt will be extinguished. A 6-3 rate on a debt of $1,000 will pay out as follows on the basis of an annual payment of $90:

No.	Int.	Prin.	Total
1	$60.00	$30.00	$90.00
2	58.20	31.80	90.00
3	56.30	33.70	90.00
4	54.30	35.70	90.00
5	52.10	37.90	90.00
6	49.80	40.20	90.00
7	47.40	42.60	90.00
8	44.90	45.10	90.00
9	42.20	47.80	90.00
10	39.30	50.70	90.00
11	36.30	53.70	90.00
12	33.00	57.00	90.00
13	29.60	60.40	90.00
14	26.00	64.00	90.00
15	22.20	67.80	90.00
16	18.10	71.90	90.00
17	13.80	76.20	90.00
18	9.20	80.80	90.00
19	4.40	72.70	77.10

If the payment be made a few cents less than the $90, it will be the same each year of the nineteen years.

There is more in the amortization plan than appears at first thought. While the payment is a little more than the usual interest payments, at the expriation of a few years the full debt will be extinguished. It is the only plan of borrowing money and exteinguishing the debt ever employed in any country that gives to the borrower the benefits of compound interest rates. It is compound interest in an inverse ratio.

To pay three per cent of a debt every year on the basis of simple interest will require 33 1-3 years to cancel the debt, but on the amortization plan, if the interest rate be 5 per cent, paying 3 per cent of the debt in twenty years, a gain of 13 1-3 years to the borrower.

If laws are to be enacted which will make it possible to borrow money for buying farms and improving them on the amortization plan, one provision should be insisted on by farmers the one that will make optional with the borrower the cancellation of the debt at any time. It would be neither fair to the borrower nor good for the country if long-time debts were to be placed against the farms of the country with no provision making it possible for borrowers to pay the debt at any time they might be fortunate enough to have the money. Even in cases where rates are given for payments, including interest, a clause may be inserted by virtue of which the borrower may discount his own notes at any time. When the amortization plan of loaning money on farms is made part of a banking or general loan system, the bank or company making the loans issues bonds against these loans, negotiating the bonds instead of the mortgages, as now done by our mortgage and loan companies. In this way the buyer of such securities has for his securities a lien on many farms, instead of the mortgage covering a single farm, as now. In several countries banks are permitted to loan to the extent of 60 per cent of the value of the farm, and then they may issue bonds to the extent of 80 or 90 per cent of the value of the mortgages. This gives the buyer a high-class security, one that sells readily, though drawing only a low interest rate, which in turn helps the farm borrower by reason of the lower rate made possible to him. The more farmers study the amortization plan of borrowing money with a view to becoming more conversant with every detail of its effect, both upon themselves and the country as a whole, the more will they be able to see and understand that no plan or system can equal it for paying off a debt.

By no other plan known can the borrower gain the benefits of compound interest in its inverse ratio.—Carlson's Rural Review.

Learn to Conserve Barnyard Manure

The scarsity and consequent abnormally high price of some of the common fertilizing ingredients is one of the outcomes of the war. We believe this condition may yet prove to be a blessing in disguise. It is urging farmers to a greater effort to conserve their barnyard manures and having once found the way to economize along this line they are bound to keep it in practice. Thousands of dollars worth of the very best of nature's feritlizers annually go to waste in the Martime Provinces. If it will be found possible to stop this great leakage it is only a question of a very short time until a prosperity hitherto unknown will be realized in Maritime Canada. It is generally conceded that live stock is the basis of the most desirable and successful systems of farm management. Why? Because under a system of live stock farming the major part of the crops grown on the farm are not sold in the raw state. They are marketed as a finished product and therefore very little of the plant food that was taken from the soil is sold off the farm, but is returned to the soil from which it came. It is estimated that the manure from a well fed dairy cow is worth twenty-five dollars when well cared for. So far the proper care and handling of manures have been very secondary considerations with the majority of our farmers. Like an oasis in a desert we occasionally find a farmer who is conserving every possible ounce of manure and invariably in such cases every evidence of prosperity is in sight.

Now that the agricultural short courses at the various agricultural schools are drawing near, our farm boys who are too young to join their country's defenders cannot serve their country to any better advantage than by taking advantage of the opportunities offered by these institutions to study the best methods for doing the various phases of farm work. We believe the proper care and handling of manure can not receive too much time in the curriculum of agricultural schools during the coming short courses. There is not a farm boy in the three provinves who can not by intelligent application of the ideas advanced on this subject alone save more than enough to cover his expenses in taking these courses. The instruction received will be an asset to him all his days.

Read the following ten commandments. Ponder them well and put them in practice, one and all of them if possible this winter. If you cannt observe them all under your present conditions try to remember the conditions so that you will not sin against yourself, your farm, or any of these truisms any longer.

Ten Manure Commandments.

1.—Thou shalt consider the value of thy farm manure for it is very great, not only unto thee, but unto them that shall come after thee.

2. Thou shalt at all times endeavor to prevent fermentation and superheating, because it will, in three or four months, mean a loss to thee of from one-third to one-half of the original value of the manure.

3.—Thou shalt not pile the manure under the eaves or on the hill-side where leaching may deprive thee of fertility worth more than what thou payest annually in taxes.

4. Thou shalt not despise the urine or liquid portion, because in it is contained over half the total fertilizing value of the manure.

5.—Thou shalt not bore holes in the stable floor or otherwise facilitate the escape of the liquid manure.

6.—Thou shalt use sufficient litter to absorb the liquid. If thou art short of straw thou shalt use leaves, sawdust or air-dried muck as an absorbent.

7.—Thou shalt not in ordinary farm practice apply the manure too heavily. It is more profitable for thee and for thy children that thy land receive frequent light dressings than heavy dressings at longer intervals.

8.—Thou shalt apply the manure at the time and in the manner to give thee best results. To be able to do this thou must ascertain the results of experiments conducted for this purpose and make repeated trials on thine own farm.

9.—Thou shalt keep live stock on thy farm, lest peradventure thy land become impoverished or blow away from thee because it containeth no humus, or fibre. It is better for thee to practice mixed farming than to follow the single crop system. Mixed farming will protect thee from the times of adversity and cause thy children to rejoice and call thee blessed.

10.—Thou shalt henceforth give thy farm manure more attention. It is of greater value each year than the wheat crop. Thou wouldst hold up thy hands in horror at the thought of one-third of thy wheat being lost, yet thou allowest that amount of fertility to escape from the manure. It is expedient for thee to refrain from wasting thy substance.

—By F. C. Nunnick, Commissioner of Conservation.

The Annual Meeting of the New Brunswick Agricultural Societies United

The second annual meeting of the New Brunswick Agricultural Societies United was held in the Government Rooms, St. John, on Thursday, November 25th, at 2 o'clock in the afternoon. R. G. Murray, the president of the association, presided, and H. B. Durost, the fertilizer expert for the New Brunswick Department of Agriculture, acting secretary since Mr. A. R. Wetmore resigned the position last May, had charge of the books and accounts.

Twenty-four men representing agricultural societies in various sections were present. The president gave a detailed resume of the various needs and steps that were taken before it was found possible to accomplish the establishment of the association. Many obstacles had to be overcome and not the least of these were concocted and slyly pressed by persons and firms who were accustomed to sell fertilizers and fertilizing ingredients to our farmers. The hen that laid the golden egg was about to be curtailed in her operations. Wow! Wow! Wow! The middleman who had fattened at the farmers' expense for many, many moons saw that the beginning of the end was in view. What a howl of distress. What a raking and searching of the provincial statutes to find out if farmers could legally join together for their own protection. Commercial agencies were put on their track to pry into the financial standing of the association. Threatening, bulldozing letters from hired members of the legal fraternity, were received. These and many other tactics were used to try to down the infant association, but to no avail. The infant has since learned to walk and is now able to talk and its joyous prattle has reached the ears of the farmers in all parts of the province. The farmers are rushing to the fold of their respective agricultural societies and by co-operative effort are able to purchase fertilizers, quality for quality, at greatly reduced prices compared with the prices they were accustomed to pay in former years when buying through the agency of the middle man. Cheaper fertilizers means cheaper crop production and more money to spend on other farm and farm home requirements.

The question of purchasing fertilizers for the farmer at the lowest market price has been solved by the association. The plan has been tried and found not wanting. In the course of a few weeks a circular will be issued to the agricultural societies throughout the length and breadth of the province setting forth the best method of procedure re the purchase of fertilizers for the ensuing year. This is necessary owing to the scarcity of potash, which is now available only at prices that are prohibitive.

Following are the officers for the ensuing year:

President—R. G. Murray, St. John.

First Vice-president—B. N. Shaw, Hartland.

Second Vice-president—Stanley Wilson, Rolling Dam.

Directors—W. H. Moore, Scotch Lake; J. E. Hoyt, Hampton; W. K. Allen, Baie Verte; Roy McCain, Florenceville ,and A. G. Turney, Fredericton.

Before the ground freezes put in the bottom part of the hotbed, for you will need to start it early next spring while the ground is still frozen. Dig a trench six feet square and one foot deep and put in your frame, which will take two sashes. Also put away some good rich garden soil where you want to cover the hot horse manure.

HORTICULTURE.

Brown Tail Moth Hunters on Trail in New Brunswick.

Four parties of brown tail moth hunters set out yesterday on their annual survey of the province.

Leonard S. McLaine, of Ottawa, the Dominion government's field officer in charge of the work in this province, will have charge of the survey this year as in the past few years, and will have the assitance of William P. Keenan, of Moncton, as general foreman of the four parties.

The outlook is that there is not likely to be a very dangerous infestation of these dangerous little insects throughout New Brunswick this year, as the nests reported are comparatively few. The work this year will be carried on on the same basis as that of last year and it will be completed in the course of a few months.

Two appointments are yet to be made by the Dominion government for their members of the party, but the provincial department's staff has been completed.

The members of the four parties are as follows:

Dominion government staff—L. S. McLaine, of Ottawa; J. R. Garreau, of Ottawa; W. P. Kennan, of Moncton; G. P. Walker and Arthur Finnamore, of Fredericton; P. N. Vroom, of St. Stephen, and Leander Simpson, of Oak Bay.

Provincial government staff—W. C. Arnold, of St. tSephen; Lancelot Connell, of St. George; S. L. Fox, of Lower Gagetown; H. W. Gilchrist, of Upper Hampstead; Alfred Corbett, of Welsford; L. F. Newcomb, of Upper Woodstock; William Stevens and Arthur Sipprell, of Hartland, and Stanley Titus, of Titusville.

The parties are divided as follows:

Crew No. 1—District of Carleton, Victoria and Madawaska counties and York county, east of St. John River; G. P. Walker, foreman, Arthur Finnamore, Stanley Titus and William Stevens.

Crew No. 2—District of York county, west of St. John river, Nashwaak Valley, Northumberland, Kent and Sunbury counties and Queens county east of St. John river; G. R. Garreau, foreman, H. W. Gilchrist, S. L. Fox and L. F. Newcomb.

Crew No. 3—District of Sunbury and Queens counties west of St. John river and Kings county; W. C. Arnold, foreman, Arthur Corbett, of Welsford, and two additional members to be appointed by the dominion government.

Crew No. 4.—District of Charlotte and St. John counties; P. N. Vroom, foreman, Leander Simpson, Lancelot Connell and Arthur Sipprell.

The Maritime Farmer solicits the ardent support of the farmers in the above mentioned districts for these young men.

Look over your orchards thoroughly, and if you find any suspicious looking nests, be ready to show the boys where they are.

The editor of the Maritime Farmer attended the first brown tail moth meeting held in Nova Scotia. It was in the town of Annapolis Royal. In company with the late Dr. Fletcher, Dominion entomologist, he started on the early morning mixed train for Dibgy. One of the train crew had been at the meeting and in course of a conversation en route he told of his acquaintance with the appearance and devastations wrought by the brown tail moth while he was a resident of the State of Massachusetts. He knew all about it. While discharging or taking on freight at a way station, the train man in quetion showed us his home with a nice little orchard surrounding it and skirting the railroad, just opposite the station. We all had brown tail moth on the brain and were keeping an eagle eye out for the enemy.

We entered the trainman's orchard and then and there, within ten yards and in full sight of the man's door, we picked off no fewer than five large brown tail moth nests. The trainman knew all about the ravages of the moth but he was not public-spirited enough to hunt and destroy them in his own orchard. Don't be in his class. Look around today.

Demonstrations in Massachusetts.

Our old friend and contributor to this paper, W. H. Woodworth, is yet in the orchard business in the Annapolis Valley, growing an average crop of 2,000 barrels during the past few years. Mr. Woodworth has been called from his native province to address fruit growers in Maine and Massachusetts. Apple culture is becoming an important business in the New England states. In our last issue we gave an article on the "New Massachusetts Apple Law." Mr. Woodworth left the gathering of his large crop in charge of one of those boys who went to make up the ten whose faces appeared long ago on the front page of our paper, and journeyed down to Boston to spend the month of October addressing meetings and mingling with the apple growers of the State. The first meeting was held in Fanieul Hall, Boston, which was attending by 200 market men and growers. Barrel and box packing was demonstrated and the Canadian law commented on; also the new Massachusetts law explained. These meetings were held in all parts of the state. With Mr. Woodworth was A. C. Brett, of Amherst Agricultural College. The weather was ideal for the work and 1600 miles were easily covered in twenty-five days over the splendid state roads by auto.

A very interesting meeting was held at Fitchburg in the notable orchard of A. A. Marshall, who grows box fruit only. Mr. Marshall grows Baldwins, McIntosh Reds and Wealthys on his good young trees. He grew 8500 boxes the past season. He caters to the high priced trade, getting $3.50 per box, c.o.d. In this orchard the greatest care is exercised. The entire orchard is in sod, fertilized with bone and potash. The grass is cut twice during the season and remains on the ground as a mulch. The trees are sprayed five times, and fruit is thinned. The trees are gone over three or four times in picking. Only the best colord fruit is picked each time. This orchard is well worth visiting.

Mr. C. F. Copeland, of Colrain, has an old Baldwin orchard in sod which has packed out the past 2 years, 4300 bbls. The fruit sold for $3.65 per barrel, No. 1 and 2, this year.

Near Worcester, at Grafton, another large meeting was held on the Mortimer farm. Mr. E. Mortimer is growing Baldwins and McIntosh Reds, with peaches as fillers. His crop of peaches this year was 30,000 baskets.

Mr. E. A. Hockett is proprietor of the Bolton Fruit Farm. He has 175 acres in apples and peaches, a wonderful sight to one itnerested in fruit growing.

At Amherst, in the orchards of Professors Sears and Waugh, another interesting meeting was held, the students were out in full force, taking a great interest in the work. Amherst Agricultural College has 625 students this year. Professors Sears and Waugh are making a great success of growing apples and peaches.

Sect. Wilfrid Wheeler, of Corcord, is doing great things for the Massachusetts fruit men and he has a band of ready helpers all over the state. The prospects for fruit growing in Massachusetts is very encouraging. We are told that fungus diseases are not so prevalent as in the Anapolis valley. The multiplicity of manufacturing towns gives a ready market for all kinds of fruits. A stranger travelling through the state is impressed with the splendid state roads, the well kept residences and the general prosperity of the people. Everything indicates business which in many instances contrasts very strongly with conditions in the Maritime Provinces.

The Culture of Roses.

The roses usually cultivated in Canada may be divided into four groups so far as hardiness is concerned:

Hardiest Group.—Rosa rugosa and Hybrids, Austrian briars, Provence or Cabbage roses, Damask roses, and Moss roses.

Roses of the Second Degree of Hardiness—Hybrids Perpetuals or Hybrid Remontant, climbing roses of the Multiflora group, and Dwarf Polyantha roses.

Roses of the Third Degree of Hardiness.—Hybrid Tea and Austrian hybrids (Pernetiana) roses.

Roses of the Fourth Degree of Hardiness.—Tea roses.

The hardiness of the individual varieties varies considerably within the groups.

Roses of this group need little or no protection in most parts of Canada. The others must be protected except in very favored localities.

Thus writes Messrs. W. T. Macoun, Dominion Horitculturist, and F. E. Buck, B.S.A., assistant, in Bulletin No. 85, of the Division of Horticulture, entitled "Hardy Roses, Their Culture in Canada," which can be had free on application to the Publications Branch, Department of Agriculture, Ottawa, and which should have an extensive circulation. It would be difficult to imagine an official publication that is calculated to appeal more strongly to the flower lover. The information that is given is complete and thorough. "Site and Soil," "Plants and Planting," "Cultivation," "Winter Protection," "Insects and Fungous Enemies," are all described. In fact, the Bulletin is, as nearly as possible within its limit of 39 pages, an encyclopedia on roses that can be cultivated in this country. Many different varieties are dealt with, tests and experiments are told about, and particulars given that can hardly fail to prove valuable to gardeners, whether amateur or professional. Every section of the country is covered and detailed lists given, with description and illustration, of good hybrid tea roses, for the garden, new hybrid tea roses and good hybrid perpetual roses. Cutlivators of the lovliest flower in creation after reading this Bulletin, no matter what their past experience may have been, it is safe to say, will be encouraged to try again and to persevere. Some of the pointers may be thus condensed:

A soil should be chosen which is naturally cool but not cold.

Strong two-year-old budded plants are the best to plant.

An abundance of moisture is needed, but not swamps.

Soils need to be kept rich by the application of manure.

Pruning is a necessity, but requires study and experience to be successfully performed.

To obtain the first flowers one must relentlessly cut back the bushes each spring to within six to twelve inches of the ground.

It is better to prune early in the spring than in the autumn.

Roses in Canada should be protected from severe wintry weather by being earthed up and covered with evergreen boughs or canvas.

Good foliage is essential to the production of good roses; hence every safeguard should be taken against insects and disease.

Roses grown in the open are usually propagated by budding; raising them from cutting not always being satisfactory.

The time for budding varies in Canada, but from the latter part of July until September the stocks should be in condition in some part of the country.

The Apple Market.

Ottawa, November 30, 1915.

(All prices quoted are wholesale, unless otherwise stated.)

Mr. J. Forsythe Smith, Trade Commissioner of the Department of Trade and Commerce in Great Britain, has cabled the following information to this Branch:—

Liverpool: Sale 24th. Americans only; Western boxes moved slowly; Californian Newtowns 7s to 7s 3d, Oregon Newtons, 7s to 10s, Spitzenberg medium size 7s to 9s. Sale 26th, market depressed, considerable quantities inferior Americans. Canadians ex Avriston, Missanabie, Carpathia, Golden Russets, ones 25s, Slacks 22 to 23s, twos, 18s to 19s, best lots 24s to 25s. threes 20s; Baldwins, ones 19s, twos 15s to 17s, threes, 13s; Starks, ones 20s, twos 16s; Pewaukees, ones 18s; Kings, ones 23s to 26s, twos 23s, threes 16s; Greenings, ones 25s 6d, twos 20s, threes spotted 10s 6d; Ben Davis, ones 17s, twos 15s. Boxes: Baldwins, ones 6s 9d, Greenings, ones 8s 6d, Yakima Winter Nelis pears 13s to 17s, according to size.

London: Sale 26th. Canadian Kieffer pears, barrels ripe ones 25s to 27s, twos 24s to 25s, boxes 5s to 7s 9d. Boxes: Baldwins 6s 6d to 7s. Russets 8s to 9s.

Glasgow: Sale 26th. Canadian Spies ones 24s to 28s, twos 23s to 25s; Kings, ones 28s to 30s, twos 23s to 25s, Ben Davis, ones 17s to 19s, twos 16s to 17s; Greenings, ones 24s to 25s, twos 20s to 22s; Golden Russets, ones 26s, twos 18s to 21s. Boxes: Spies and Kings, ones 10s to 11s, twos 7s to 7s 6d; Greenings, ones 8s to 9s, twos 6s 6d; Manns, ones 7s, twos 6s; Snows, ones, 11s; Golden Russets, ones 8s to 9s, twos 6s 6d.

Information has also been received by telegram from Canadian points, as follows:—

Halifax: Sixteen thousand barrels apples exported during week ending November 27. Fruit keeping well. No. 1's $2.50 to $3, No. 2's $2 to $2.50, Co-operative No. 3's $2. Local market well supplied and retailing 50c to $1 higher than wholesale. S.S. Shenandoah will take 30,000 barrels this week.

Quebec, P.Q.: Ontario apples: Spy No. 1 $6, No. 2 $5; No. 3 $3 to $3.50; Greening No. 1 $4.50, No. 2, $4; Baldwin No. 1 $5; No. 2 $4.50; other varieties No. 1 $4 to $5; No. 2, $3.75, No. 3 $3. Nova Scotia Blenheims No. 1 $4, No. 2 $3. Quebec Fameuse No. 1 $7, No. 2 $6, No. 3 $4 to $4.50. United States Baldwins $4.50. All prices for best stock.

Montreal: No. 1 apples: Spy $5.50 to $6, Fameuse and McIntosh $6 to $7, Baldwin and Golden Russet $4.50 to $5, R. I. Greening $4 to $4.50. Other varieties $3 to $4.50. Winter Nelis pears $4 per box; Keiffer pears $3.50 to $4 per barrel. Approximately 75 per cent of apples sold in this market by auction. Mostly No. 2's and 3's offered. Lowest class 3's selling $1.65 to $2.25; better grade $2.50 to $3 per barrel.

Ottawa: Spy $6 and $5.50, Baldwin $4.50 and $4, Pewaukee $4 and $3.50, Snows $6 and $5.50, Tolman Sweet $4 and $3.50, King $5 and $4, Stark $4.50 and $3.50, Golden Russet $5 and $4, Blenheim Pippin $4 and $3.50, Ben Davis $4 and $3.50 for No. 1 and No. 2 stock, respectively.

Oshawa District: Fruit moving slowly. Very little for export. Practically half the fruit is being packed as No. 3. Good local demand.

Toronto: No change in prices since last report. Larger quantity of apples in store than last year. Practically nothing but No. 3's being offered.

Hamilton: Cull apples selling: Spies $1.25, Baldwins and Greenings 75c per bushel; Spies $3.50 per barrel. It is reported that there are some 9,000 barrels of apples in common and cold storage in Hamilton District. Demand good.

Winnipeg: Arrivals last week; 31 cars Ontario apples, 3 cars British Columbia and 2 cars imported. Imported prices: Apples $3.50 to $4 per barrel; Jonathans $1.50 to $2, and Winter Bananas $2.25 to $2.50 per box; Jonathans and other varieties $1.50 to $1.75 per crate. British Columbia prices; Spies No. 1 $2.50, No. 2 $2.25; other varieties $1.50 to $2 per box; pears $3.25 to $3.50 per box. Ontario prices: Spies No. 1 $6.50 to $7, No. 2 $5.50 to $6, No. 3 $4.75; Baldwins and Russets No. 1 $6, No. 2 $5.50, No. 3 $4.25 per barrel; Spies, Greenings and Baldwins $1 to $2.25 per box. Nova Scotia prices: Kings $5; Ribstons and Blenheims $4.25 to $4.50.

Edmonton: 10 cars received during past week. 2 cars imported apples, 5 cars apples (wrapped) and 3 cars (crates) from British Columbia. B. C. No. 1 Jonathans $1.90; other varieties and imported, all wrapped $1.65 to $1.75. Ontario bulk apples in crates $1.

Brandon: Imported apples in boxes; $2 for No. 2's and $1.85 for No. 3's; grapes (Emperor in drum) $6, Malaga (in keg) $8. British Columbia apples in boxes $2.25 for No. 1's, $2 for No. 2's; in economy crates $1.50; pears in boxes $3.50 for No. 1's and $3 for No. 2's. Nova Scotia apples in barrels $4.50 for No. 1's and $4.25 for No. 2's. Ontario apples in barrels, $6.50 for No. 1's, $6 for No. 2's and $4.75 for No. 3's; pears in eleven quart baskets 50c and in six quart baskets 35c. No Ontario apples in boxes.

Calgary: Prices for No. 1 apples in boxes: Jonathans, Salome, Ontario, Baldwins, Greenings and Hubbardston $1.75, Wagener and Rome Beauties $2 to $2.25, McIntosh $2.15, No. 2's fifteen cents less; No. 1 Keiffer and Windsor pears $3.25.

Saskatoon: No change in prices since last report. Market clear of crated apples. Good demand for Ontario barreled apples and pears. Market well supplied with boxed apples.

Lethbridge: Few cars received last week. No. 1's $1.85 to $2, No. 2's $1.65 to $1.75 per box; crates $1.40 to $1.50. Pears $2.75. Wholesale houses well stocked.

D. JOHNSON, Commissioner.

Figuring Profits in Apple Orcharding.

There is demand for knowledge concerning profit from an apple orchard. The following data are taken as an average from an experiment running 10 years, conducted by Prof. U. P. Hedrick, of Geneva Station, N.Y., in a 10-acre Baldwin apple orchard and give a substantial foundation as to the outgo and income from an orchard in New York state. The data, as far as possible, are given for three units—the barrel of apples, the tree and the acre.

In figuring the profit, the first information necessary is the number of barrels of apples an acre for each year. The exact number for this 10-year average is 116.8. When graded, the acre average for the period is 79.2 barreled stock and 37.6 of evaporator and cider stock. Reducing these figures to the tree unit, we have for barrel stock 2.93; for evaporator stock 1.4; or total for each tree of 4.33 barrels.

The first item in cost of production to be considered is interest on investment. When in full bearing in the prime of life, what is a Baldwin orchard worth? We will suppose the value to be $500 an acre and the interest 5 per cent. This valuation includes not only cost of land, trees and labor, but the deferred dividends of the first 12 or 15 years. It is sufficient, too, to cover the overhead expense of houses and barns. The first expense, item then is $25 an acre on investment, a sum which, divided by 116.8, the number of barrels an acre, gives a charge of 21 cents for each barrel as interest on investment. Since this orchard is but a part of a general farm, only an estimate can be made of the cost of taxes. There are few regions or years in New York in which taxes for such an orchard would be over $1.50 an acre, making the tax on each barrel of apples 1.2 cents.

The next account to be charged to cost of production is depreciation in teams and tools, and interest on the money invested in them. First-class machinery for running the average orchard will cost in the neighborhood of $1,000, the items being as follows: Team $400, spraying outfit $250, harness $50, wagon $75, plow, crates, pruning tools, etc., $115. If we set the depreciation and interest on money at 20 per cent for the above equipment, we must add 17 cents a barrel of apples to the depreciation account. The annual cost of tillage to the acre for the decade was $7.39, making the amount to be charged against each barrel of fruit 6.3 cents. The price paid for team work at the beginning of the period was $4 a day of 10 hours; but the price advanced to $5, a fair average being $4.50. For the cover-crop seed in this orchard, must be addded $2.74 an acre for seed, orf 2.3 cents a barrel of apples. The expense of pruning an acre each year was $3.56. Since there are 27 trees to the acre in this orchard the cost for a tree was 13.1 cents. The cost for each barrel of apples was 3 cents. The average price paid for the work was $2 a day of ten hours. The average cost an acre for spraying was $11.28; a tree 41.8 cents, a barrel of apples 9.6 cents. The last of the cost of production charges is that of superintending the work. The Geneva station paid for this service $300 a year.

Picking, packing, sorting and hauling have been done in diverse ways during the 10 years and the items cannot be segregated. But the total cost of these operations have been 24.4 cents a barrel. The following is a summary of the cost sheet for a barrel of apples: Interest on investment, 21 cents; taxes, 1.2; tilling, 6.3; pruning, 3; spraying, 9.6; cover crop, 2.3; superintending orchard, 25, and picking, packing, sorting and hauling, 24.4, giving a tottal of 93 cents a barrel.

The average price of barrels for 10 years has been 36 cents each; the price fluctuated from 30 to 40 cents. Adding the cost of the barrel to the cost of production we have $1.29 as the total cost of a barrel of apples at the shipping point. We come to the average price of apples for the past 10 years as grown in the orchard. An average of $2.60 was received for all the barreled stock sold, which includes firsts an dseconds. For evaporator and cider stock we have received 72 cents a barrel. The average yield of the orchard for the ten years has been 79.2 barrels of barrel stock an acre, and 37.6 barrels of evaporator and cider stock.

In calculating profits and declaring dividends: Substracting $1.29, the cost of a barrel of apples, from $2.60, the amount received, and a net profit of

DAIRYING.

Use Concentrated Feeds Wisely

Great Differences in Composition of Feeds—Buy Cottonseed Meal Before It Goes Higher.

Too many farmers are feeding stock from habit, rather than from intrinsic value of feed to the animal and the plant food returned in the manure. The careful feeder, before purchasing, considers three fundamental factors—amount of nourishment for the animal, the probable manurial value, and the initial price of the feed.

Those wishing to feed for the largest profit will be greatly helped by using tables A and B herewith, which are made plain by their accompanying explanation. The hay, silage and roughage produced on the farm contain comparatively little protein or fat and oil, but are rich in fibre and starch, and have some sugar. Hence the farmer buys concentrated feeds that are rich in protein or nitrogenous matter so as to balance up the feeds produced on the farm.

Concentrates are bought mostly for their protein and fat. Protein is the most costly element in boughten feeds. Therefore, buy concentrates which will give you the most protein and fat for each dollar that you spend. The table shows that a good standard quality of cottonseed meal will contain 37 pounds of digestible protein in each hundred weight. This is nearly one-third more protein than you can get in the next richest concentrate—old process linseed oil. Table A gives the amount of protein in each of the other feeds named.

Cottonseed Meal Economical

To judge solely upon protein basis, cottonseed meal carries the most nourishment, but at the retail price quoted costs a trifle more than gluten meal. Yet without reference to the other elements, a little figuring shows that a pound of digestible protein at the price quoted costs in cottonseed meal 43 cents and in gluten meal 56 cents. Applying a fair price per pound to each of the digestible elements, cottonseed meal has a comparative feeding value of $1.16 per hundred pounds, compared to only 84 cents for corn meal.

Going over to table B, you will see that cottonseed meal is so much richer in nitrogen, phosphorus and potash that its manurial value is $1.20 per 100 pounds, compared to only 28 cents for corn meal and 77 cents for gluten meal. Hence cottonseed meal is not only the most economical source of digestible protein for feeding live stock, but it also returns to the manure pile four times as much plant food as the corn meal, and much more than gluten by-products.

No concentrate provides digestible protein so economically or returns more manurial value than does cottonseed meal at present prices. The gultens, linseed and wheat middlings, come next.

When it comes to corn products, such as meal, hominy chops and mixed feed (meaning oats and corn ground in equal parts), the comparison is far behind the cottonseed value. Still, the fact remains that thousands of farmers are buying corn meal to feed. These are the ones who are most likely to complain about not getting a new dollar for an old one in the dairy business. They should study the tables and buy accordingly.

This does not mean that cottonseed meal is to be the only concentrated feed purchased. The fact that it is so powerful, means that it should be mixed with something more bulky for best results. This may be bran, middlings, a little gluten or brewers' dried grains, or perhaps a dash of some corn meal if a flesh builder is especially desired. The old notion that cotton seed meal is extremely dangerous to feed still sticks in the minds of some farmers. Several feeding rations of very successful dairymen have been printed in these columns in past months showing that cottonseed meal is one of the safest of feeds, provided you mix it with brains.

Readers understand that protein is the nitrogenous portion of the feed, furnishing material for lean flesh, blood, skin, muscles, nerves, hair, the casein and albumen of milk, etc. Fibre is the framework of plants, and is the most indigestible constituent of feeds. In general, the nutritive value of a feed increases as the proportion of fibre decreases. Add to the fibre the starch, sugar, gums and organic acids and you have what is known as carbohydrates. They are generally spoken of as heat-producing substances, as against the flesh-forming substances, the latter being provided by nitrogenous compounds.

As one looks at the analysis on a feed bag he should watch for the figures giving digestible constituents. The indigestible parts give no food value, but passes off into the manure. Why pay $1.25 to $1.50 per 100 pounds for corn meal which our tables show have a total comparative value of only 98 cents per 100 pounds, when you can buy cottonseed meal that it worth for feed and fertilizer more than it costs?

International Stock Food Tonic

is equally good for

COWS HORSES PIGS

THIS famous Tonic is for all livestock—to make cows give more milk—to keep working horses in prime condition—to keep pigs healthy and promote very rapid growth and at a small cost of "3 Feeds for One Cent." How does it produce such results? International Stock Food Tonic is prepared from powdered medicinal roots, herbs, seeds and barks for the special purpose of giving a small amount with the usual grain feed for each animal. The pure vegetable ingredients we use purify the blood, cure indigestion and many other forms of disease;—"tones up" and "builds up" the entire system permanently.

It s the best thing you can give a horse for Epizootic, Indigestion, Liver Trouble, Coughs, Influenza, Hide Bound or Blood Trouble. If you have horses or colts for sale, be sure and give them International Stock Food Tonic for thirty or sixty days. Its every-day use will often add $50.00 to $100.00 to their value because it quickly causes them to greatly improve in general appearance. International Stock Food Tonic is a wonderful cow tonic and milk producer. It increases both the quality and quantity.

This famous tonic is endorsed as the surest hog tonic in the world. Twenty-six years' use by over two million farmers indisputably proves its extra money making results.

If you are not using this Reliable Tonic to-day, you are missing a whole lot of actual profit. Get a package or pail at your dealer's. See what wonderful results can be obtained.

It is put up in all sizes: 50c. and $1.00 packages, $1.50 lithographed tins and 25 lb. pails at $3.75 each. For sale by Dealers everywhere on a spot cash guarantee.

How to Insure Separator Satisfaction

Dealers are in position to do a great deal toward educating their customers properly to care for the machines they sell them. Particularly is this true of the cream separator. The mechanism of the cream separator is not exactly delicate—no more so than the knotter on a binder—but the separator is a little more likely to get out of order.

Most of the complaints dealers receive concerning the results obtained from cream separators proceed from improper adjustment, operation or care of the machine, and it is these things that lead to the return of machines which will do all that is claimed for them under proper conditions. It is, therefore, of the utmost importance for the dealer first to learn just how a cream seperator should be placed, operated and cared for, then to urge his separato· customers to observe the rules. Strange as it may seem, the average farmer pays more attention to suggestions coming from the dealer at time of sale than he does to the directions accompanying the machine; at least, he is more likely to follow directions closely if he has been warned by the dealer.

The bowl should perhaps be given first attention. Owing to the high speed at which it revolves, it is necessary that the bowl be perfectly balanced—and to insure its remaining in perfect balance the machine should be placed on a firm foundation. Solid flooring, a heavy block of wood, to which the sepaartor can be securely bolted, or a concrete block may be used successfully, with the choice in favor of concrete, because it does not become greasy so easily and is easier to keep clean.

When set in place and ready to operate care should be taken to turn the carnk at the proper speed. The speed is usually indicated on the crank arm; but if not there, it can always be found in the setting-up directions. It is also important that the milk be separated at the proper temperature. Some separators skim milk closer than others—leave less butter fat in the skim milk—but all cream separators leave a large percentage of butter fat in the milk when the milk is cold.

It is a good practice to run a few quarts of warm water through the bowl before starting the milk through the machine. The temperature of the milk should be about the same as it is when first drawn from the cow—and the best time to separate the cream from the milk is immediately after milking. After all the milk has been run through the separator, it is a good plan to run through two or three quarts of skim milk to flush out the cream that otherwise would remain in the bowl.

The dealer should advise buyers al-

TABLE B—The Manurial Value

of the concentrated feeds named in the table above. It shows the amount of digestible nutrients in 100 lbs of each of these concentrates when of fair average quality. For instance, cottonseed meal may vary in its quality, but 100 lbs. of it of average quality should contain 37 lbs. of protein (nitrogen-containing substance) in a form digestible by live stock, 13 lbs. of digestible fat and oil, 18 lbs. of digestible sugar, starch and fibre (carbohydrates). If each pound of digestible fat and protein is worth 2c and each pound of digestible carbohydrates worth 1c as a feed, then the feeding value expressed in money is $1.16 per 100 pounds. Allowing that only one-half of the plant food contained in the concentrate is saved in the manure, and adding this half to the feeding value, we get a total value of $1.76 per 100 lbs of cottonseed meal. The same explanation applies to the other feeds.

of concentrates depends mainly upon the amount of nitrogen, phosphoric acid and potash they contain. This table shows the number of pounds of these three elements in 100 lbs of each of the feeds noted. Allowing 15c per lb. for nitrogen, 5c for phosphoric acid and 4c for potash, we get the manurial value per 100 lbs. Thus 100 lbs. of cottonseed meal contains 6.6 lbs. actual ntirogen, 2.7 lbs. of phosphoric acid and 1.8 lb. potash. These quantities of plant food are worth apparently about $1.20 for manurial purposes alone. The phosphorus and potash are usually all saved in the solid excrement. Even allowing for the waste of nitrogen, at least half of the manurial substances in the meal should be got back in the manure, and more under good management. Retail prices differ, but in the middle and eastern states are around the figures quoted in the last column.

ways to run the machine at the full speed indicated on the crank arm or in the insrtuctions for setting up and operating the separator. If run at a less speed the percentage of butter fat left in the skim milk will be greater. As much as 1 per cent of the fat may be lost on account of the slow speed, whereas the correct speed would cut this loss down to almost nothing. When the machine is operated at a speed higher than rated, there is danger of breakage. The ear soon becomes accustomed to the hum of the bowl when operated at proper speed.

The dealer should impress upon the minds of the purchasers the importance of keeping the separator clean. This part of the work is frequently neglected. It should be made a part of the regular work of the dairy. To insure cleanliness the separator should be taken apart quite often so that the gears and other parts can be well cleaned. The oil collects dust particles which, if not removed, will soon cause the machine to turn harder. Oil cups need to be cleaned out often and the oil should be replenished each time the machine is used. The best separator oil should be used. The machine should be washed every time it is used. The dirt and slimy sediment removed from the milk collects in the bowl, and if not washed out the efficiency of the bowl's separating capacity is materially impaired. To kill the bacteria the bowl parts should be placed in an oven for a while and then exposed to the sun: in fact, all dairy utensils should be exposed to the sun every day, for sunshine destroys all disease germs more surely than any other purifier.

A Hard Question to Answer

The Farmer's Review says:

Fifteen years ago an assistant in the dairy department of the University of Missouri began to keep records of the milk and butter production of a small Jersey cow. This assistant has gone and others have come and gone, but the faithful cow is still on the job. In the fifteen years she has given 108,968 pounds of milk and 5,833 pounds of butter. Her best year's record was 13,322 pounds of milk and 730 pounds of butter. The cow has given birth to twelve calves, which have sold for $2,400, or an average of $200. Her milk and butter products, figured at market prices, equals a still higher total. The approximate cost of keep was $50 a year, or $750 for the entire period. Anyone can figure the profits. What is such a cow worth? What is the value of a dairy herd composed of ten or twenty such individuals?

But there is a bigger lesson contained in the history of that cow than merely her commercial value.

1. It tells eloquently a story in favor of the oft-much despised Jersey. That's a wonderful record for any cow of any breed to make.

2. It tells volumes concerning the great importance of putting the best performing blood one can get into a cow. Give her a sire particularly that will boost her to a long life and a big record. It is the owner of the mother of such a cow that is wholly responsible for the kind of sire she is to have.

3. Don't consider that a little extra money for a well bred, prepotent sire is thrown away.

What Hinders Profit in Dairying ?

The other day a friend addressed us the above question and asked us to write him our answer. We did so, and here it is:

The main thing that hinders profit in dairy farming is poor cows. By that we mean keeping a lot of cows which do not pay any profit on their keep. If the average cow farmer could be induced to enter upon a vigorous campaign against himself and his lack of good cow sense, as well the poor cows that he insists upon keeping year after year, there would be a revolution in this cow business. Put the question any way you please and it comes out the same:

1. We never yet saw a herd of cows of high average quality that did not pay a profit. Did you

2. We never yet saw a herd of low producing cows, no matter what their breed, that paid a profit. Did you?

3. We never yet saw a dairy farmer who resolutely set to work to cull out and grade up his herd but that made money by it. Did you?

4. We never yet saw a dairy farmer who let things run along in a loose, unsystematic manner; who would do nothing to bring up the standard of production in his herd; who made any money in dairying. Did you?

Put these questions together; apply them to the situation as it exists on your farm and about you. Deduce from them what you should do to raise the standard of profit and you will find yourself doing a lot of things that help that are not mentioned here. Start the farmer to looking at the question of profit from the right standpoint and he must be a dull man who can not then improve his condition.—Hoard's Dairyman.

Hand Separator Cream.

Patrons of cream gathering creameries frequently complain of the variations which occur in the pec.entage of fat as revealed by the test of the cream delivered from time to time. These variations have given rise to more or less dissatisfaction on the part of the patrons, and have been the cause of unnecessary friction between them and the managers of creameries A series of tests and experiments bearing on this poitn have recently been completed by the Branch of the Dairy and Cold Storage Commissioner of the Department of Agriculture, at Ottawa, and the results obtained are published in circular No. 14 of that Branch. It is desirable that creamery patrons should know the results of these experiments. Managers of creameries may apply for and secure from the Publications Branch of the Department of Agriculture, Ottawa, sufficient copies to supply each patron. Individual copies will be sent to those who apply for them.

Disease of Animals and How to Treat Them.

At a recent institute school in the third district of New York, Dr. Hamilton, one of the state veterinarians, gave a most excellent talk on some of the common diseases of farm animals. In the first place, in giving medicine, it is best to have it well diluted, either with water, oil, or milk. Many medicines are strong, and if not diluted are liable to burn or, at least, cause discomfort. When giving medicine to a horse, some people pour it through the nostril, as a horse does not swallow well. This should never be done, but three or four drops of medicine may be placed in the nostril, as the sensation thus produced may aid the horse to swallow. In all cases when an animal strangles, drop the head at once. It is better to lose a little medicine in that way than to allow the animal to strangle. The reason for avoiding strangling is not altogether the discomfort of the animal, but for the same reason that medicine should not be administered through the nostril of a horse, namely, that either act may result in some of the medicine being drawn into the lungs. If that occurs there is great danger of pneumonia resulting, and pneumonia is almost always fatal.

Milk fever was formerly considered a fatal disease, but now it is unnecessary to lose a case, if taken in time. It appears soon after calving, usually within one or two days, but in rare instances as late as a week or ten days. It appears to be a sort of paralysis, especially of the hind parts, and is likely to attack the best cows. There is a decreased milk secretion, little manure, and the cow does not walk right at the beginning of the disease. She wabbles, and finally goes down as in paralysis. Do not give any medicine by the mouth, at least not in any quantity. If the cow is cold, fifteen or twenty drops of aconite may be placed upon the tongue, and if weak, thirty to forty drops of nux vomica may be administered, but usually give nothing. Inflate the udder. That is the only way to combat the disease. It is a good plan to get a veterinarian but any one may give the treatment if careful. There is some danger of getting garget if one does not use sufficient care. Some use oxygen to inflate, but clean air is as good. A regular milk fever outfit is desirable for the purpose, but if none is at hand, one may use a bicycle pump if everything is made perfectly clean. Cleanse the udder and teats, using carbolic acid in the water for washing. Carbolized water may be used to sterilize the milk tube, or the tube may be boiled thoroughly. Inflate slowly and continue until the air bubbles out. Tie the end of the teat with tape or with a slake twisted bag string, and leave for three hours. It is not wise to leave the tie too long, as it interferes with circulation in the teat. Do not milk out the udder for eighteen to twenty-four hours.

Milk fever may be prevented in a measure by leaving most of the milk in the udder for a few times. Do not leave the calf with the cow, as he may suck all the milk. The reason is that too much blood congests in the udder and circulation is not good. The second day three-fourths of the milk may be drawn, usually.

There is a disease of horses that is similar in its causes and effects to milk fever in cows. That is, there is congestion and poor circulation. It is called black water. It does not come on while the horse is in the stable, but usually while traveling the first mile or less after standing for some time, as over Sunday or longer, and it attacks the heavier horses, not very frequently the light road horses. The horse commences to lag, sweats about the flanks, appears lame, and there is paralysis. When the symptoms are first discovered stop the horse and apply a blanket, whether in the road or a barn. Get the horse to a shelter or barn if possible. Frequently the animal recovers in a half hour, but if he goes down he is liable to die. A veterinarian is needed in a bad case. The bladder should be emptied, and if the muscles become rigid, heat should be applied. Hot salt in small sacks is best, and apply over the kidneys. Hot water may do if nothing better is at hand. The trouble may be prevented by dividing the grain ration when the horse is to remain idle for a little time. On Saturday night a bran mash may be given to a heavy work horse that is to be idle over Sunday, and a tablespoonful of saltpeter may be added. When starting, after standing for a little time, drive slowly for the first half mile.

In case a cow commences to bloat seriously it is frequently best to tap the left side. The causes of bloating may be several. A change to good growth of pasture, or eating too much grain, if loose, or indigestion from whatever cause may cause bloating. It is safer, generally speaking, for a farmer, to tap a cow than for a veterinarian to tap a horse. Select the place most distended, usually six or eight inches back of the ribs, clean off the hair and disinfect by using a five per cent solution of carbolic acid. Take the spout of an oil can from the mower. Disinfect the knife and the oiler spout by boiling thoroughly, or by means of the carbolic solution, thrust in the blade to its full length, and before removing the knife blade work the nozzle down by the side of it, and let the gases escape through the nozzle. As a rule, one pound of Epsom salts may be administered with good effect.

In cases of choking, it is a good plan to place a stick in the mouth, well back, and fasten there with cords over the head, and give the animal some exercise. Sometimes by standing on the left side, the obstacle which causes the choking may be detected, and worked up with the hands. When almost up, a quick thrust may force it far enough so that the cow can reach it with her tongue and then she will be able to bring it forward and chew it out. If not, use a clevis to hold the mouth open and one man can reach down the throat far enough to get the obstruction when the other works it upward. If the obstacle is too low down, it may be necessary to use a probang, to force it down. As a substitute, it is possible to use a one-inch rope, or a trace from a double harness, a piece of rubber hose, or even a whip stock. Oil well and be sure to force far enough down. It is farther to the stomach than one is apt to think. The piece should be six or eight feet long.

"Colic in horses is a source of much loss in New York state," said Dr. Hamilton. Some horses are particularly subject to one form or another of it. Proper feeding and watering may prevent tatacks. It is better to water horses the first thing in the morning, than feed hay and later grain. The stomach of a horse is small and if grain is fed first, some of it may be washed out when the horse drinks and before it has reached the proper stage of digestion.

Gas colic is the most common and is due to gas in the intestines. There may be bloating on the right side. The pain is continuous. It is all right to let the horse lie down and there should be ample space for him to do so. To get up and down every few minutes is not advisable and the horse should not be allowed to throw himself as there is danger that he may rupture something. A little soda and ginger may be good or a two ounce dose of turpentine in a pint of raw linseed oil may be used.

We pay highest Prices For RAW FURS And Remit Promptly

More Trappers and Fur Collectors send their Raw Furs to us than to any other five houses in Canada. Because they know we pay highest prices, pay mail and express charges, charge no commissions, and treat our shippers right. Result, we are the largest in our line in Canada. All these books fully illustrated and sent FREE ON REQUEST.

John Hallam Limited 336 Hallam Building TORONTO

Spasmodic or cramp colic, said the doctor, may be brought on by giving water or grain in too large amounts when the horse is warm and tired. It is best to feed lightly under such circumstances, and when new hay is fed, give salt. Cramp colic is a cramping of the bowels. Bloating is not common until later, and there is usually intermittent pain. If the pain is severe, laudanum may be given, and two ounces is a full dose. It is best given in oil. One ounce rose of chloral hydrate may be given in a quart of water. If the horse gets sleepy, he is better. If not sleepy in half an hour, give half as large a dose as before.—Hoard's Dairyman.

Starting the Calf on Way to Cowhood.

It is easier to teach the calf to drink if it is never allowed to nurse. Aside from this consideration, however, it is more advisable to leave the calf with the cow for the first two or three days, especially if a considerable amount of inflammation is present in the cow's udder. By so doing the calf gets a thriftier start in life and also proves helpful in reducing the inflammation of the udder through the process of nursing. When the calf is taken from the cow it should be fed three pounds of its mother's milk—immediately after milking—twice daily or better two pounds three times a day. It is very essential that the milk be given at a temperature approximating 98 degrees Fahrenheit and that the receptacles conveying the milk be kept scrupuolusly clean and free from germ life. At best scours are liable to affect the calf when hand feeding is resorted to. To fully eliminate this liability it is very advisable to follow regularly and persistently the practice of stirring in the milk one teaspoonful blood flour which can be obtained directly from the packing houses. This feed is one of the best known bowel correctives. I refer to it as a feed for in reality there is nothing that can be added to the milk or given to the young calf that will supply in so digestible a form identically the nutrient which is necessary to narrow the ratio of the milk nutrients and furnish protein from which muscle, lean meat, cartilage, blood, etc., are made. —Prof. H. V. Van Pelt.

Canada's Live Stock Industry.

In competing for the markets of the world there is no branch of industry that exceeds in importance that of live stock breeding and raising. Paraphrasing the old Jingo cry, we have the land, we have the will and we have the climate. What is needed is the means, and ever more means, and simultaneously the ways of marketing. However divergent in views and theories people may be, it cannot be denied that they are all united in a common effort to improve both agricultural and industrial conditions. In helping the one the other is being aided. The interests are inextricably involved. If either is especially prosperous both ultimately must be, although one may feel the benefits of extra demand and high prices before the other.

In the past few years especially, all the provincial governments as well as the federal government have bent much of their energies towards the improvement and extension of agriculture. While a deal of scientific effort has been devoted to the cultivation of the land and improvement of productions of the soil, sight has not been lost of the needs and necessities of that other branch of inestimable worth—live stock, meaning thereby horses, cattle, sheep and swine. In the latter direction pure-bred animals have recently been placed in various districts where their services were previously difficult to obtain, the registration of pedigrees has been nationalized, systematized and subsidized, grants towards greatly liberalizing the premiums at exhibitions have been made, a special branch has been established in connection with the Experimental Farm system at Ottawa to investigate the cause of disease, to

MAXWELLS LIMITED - ST. MARY'S, ONTARIO 3

give counsel to breeders and to control outbreaks of infectious or contagious ailments, judges and lecturers have been appointed free of cost, cold storage facilities have been arranged and refrigerator cars equipped and paid for, grants have been made under the tremendously beneficial Agricultural Instruction Act with its ten million dollar attachment, for the encouragement of veterinary education and research and everything possible has been done for the development and increase of co-operation.

Important and valuable as are and have been the efforts above enumerated in the interests of live stock breeding the devotion of the Federal department and the Provincial departments has been by no means limited to them. In fact as far as present human ken can travel little has been left undone. But one of the greatest lines of endeavor has yet to be mentioned, namely the improvement of marketing and transportation facilities. While this object has never been lost sight of, constant attention having been bestowed upon it in various ways, it remained for the present Dominion Minister of Agriculture to take the matter boldly into his own hands and, with the assistance of a capable staff, to devise a policy calculated to lead to definite, distinct and permanent advancement. Without inquiry and investigation nothing can be methodically and satisfactorily accomplished.

With this principle in view a marketing commission was appointed, the duties of which were to ascertain advantageous points of sale and to effect and bring about the most convenient and economical arrangements for disposal, shipment and carriage to destination. It was in following this policy negotiations were carried on for the purchase by the British government of six million pounds of meat canned in Canada.

Owing to high freight rates, disturbances in shipping and scarcity of boats, unwonted difficulties have recently been experienced in exportation and even in handling across the continent. It is towards remedying these and placing matters in a much better light and on a greatly improved footing that the commission has been created. In many ways there is evidence that this is being accomplished, although undoubtedly there are obstacles to overcome that will be continually cropping up. Nor is the appointment of the aforementioned marketing commission the only step that is being taken for the advancement of the live stock and agricultural interests, but a commission of influential, widely-known and experienced business men has been appointed to go into the whole subject and to report upon the most advisable measures to be taken for the advancement of farming, breeding and raising, shipping and selling and financing, and for the aggregate prosperity of the country.

Keeping Hogs Free of Lice.

Disease and unthriftiness in hogs are usually, if not always, accompanied by the presence of body parasites, internal or external. The farmer who is feeding a lousy pig or a ticky steer is simply putting up feed enough to support the animal and the parasites as well.

This direct extra outlay, however, does not represent the whole loss. No animal can thrive and do its best when tortured and tormented by lice. The dipping vat and the rubbing post are two of the principal agents in general live stock sanitation through which we may hope to be free from animal diseases.

The southern people are fast ridding their herds of ticks and of the Texas fever they carry by means of the dipping vat. The western sheepman with the assistance of state and nation has practically cleaned the range of the scab parasite. The corn belt hog grower is ridding his hogs of lice and keeping them clean by the dipping vat and more largely by the oiler in some form.

The hog oiler is simply an outgrowth of the old rubbing post idea. Hogs are notoriously lousy animals and become especially so in winter and early spring when dipping in open vats is almost out of the question. Lousy hogs, cholera and other diseases almost always go together.

We used to recognize the lousiness of the hog by fixing a rubbing post where he could scratch himself, but merely scratching did not and does not get rid of the parasite. The modern form of rubbing post is a hog oiler of some sort where vermin-destroying oil comes from the post, distributes itself over the hog's skin and makes and keeps him clean.

"I used to spread crude oil on the surface of a hog wallow formed from the overflow of my tank and this kept the lice down in summer and fall," writes H. C. Williamson, a successful Nebraska farmer, and hog grower. "I learned, however, that in winter and spring the vermin multiplied and worried the hogs incessantly and I found no convenient and effective method of combat until the oil-rubbing post came to my notice. I gave them a thorough trial and found that they solved the problem."

Cold weather is no obstacle to their successful use. Specially prepared vermin oils may be used, while the heat of the animal's body will help spread crude oil if this be used. A little kerosene added loosens up and thins the mixture if extremely cold weather has made it gummy.

The Average Hog in Farm Economy.

An ancient treatise on hogs reads as follows: "Hogs are most extraordinary animals; but though in many respects rather disagreeable they are of very considerable importance to the community at large and to farmers in particular. There is no other animal affords so much human sustenance in flesh, in proportion to the time in

which it is raised, and in no instance has nature shown her economy more than in this race, their stomachs seeming to be intended as a receptacle for many things that other creatures refuse and which, but for them, would be entirely wasted, for they industriously gather up and greedily devour what would otherwise be trodden under foot—the refuse of the fields, the gardens, the barns and the scullery." From which it appears that the independent and gentlemanly hog has carefully guarded and preserved in his march down the ages those qualities which constitute him now and at all times a pig. The woman at the exhibition remarked also, "It's no wonder they call them pigs," without any explanation whatever. It would look as though hog nature was well enough understood to make it possible for those speaking of hogs to put their ideas into well packed expressions.

About the disagreeable aspects of the hog we do not propose to go further than to notice that the hog is a much maligned creature. He is the only one of the domestic animals that takes specific care not to foul his nest. If there is still any disagreeable feature in hog keeping it is due to the breeding and habits of the hog man. The interesting and necessary thing to settle is the place of the hog in farm and general economy. The ancient writer quoted above didn't omit much in his sketch paragraph—the value of the hog to the community, to the farmer and the capacity of the hog for the conversion of waste foods.

Pork a Standard Commodity

There is no class of meat of greater general usefulness. It is the best suited of all for stored meat. This applies to all classes of consumption. The hog has adjusted his cuts susceptibly to the people of both strong and delicate stomachs, in town, country and camp. Everybody knows this, of course, but it is worth while telling the producer over again that because pork is so easily cured it is always available to the consumer which has made it a commodity of universal standard demand and hence it should be a universal factor in farm enterprises and production. The trouble seems to be that the demand is not judiciously nursed or fed. Of course, all meat products suffer from capital monopoly and want of effective and actual competition in marketing, but there are certain troubles and disorders on the marketing side that are peculiar to the hog. Pork is peculiarly subject to ups and downs in marketing, especially downs. Hogs breed young and produce more abundantly than any other kind of farm stocks and gluts are more easily produced. When high prices are running everybody gets out for a few sows. In a few months the hog population is increased from five to ten fold. Hogs are commonly produced or at least finished on a considerable quantity of concentrated feed and there is a stated time at about the age of six or seven months when the value of quality at least, of pork is highest and when the limit of profit in feeding is most nearly reached and they practically have to be sold. When prices fall the unloading process is intensified. Young or half finished hogs are run on the market and prices are cut worse than ever. The farmer becomes disgusted and goes out of hogs. That is what happened last winter when grain went so high. Feeding and breeding both stopped. Now, the prices of good sows is high again. Everybody is in the scramble to get in and start another glut. The quick multiplication of hogs seems to have the effect of putting farmers in when they ought to be out and out when they ought to be in.

Commercial Agriculture Overworked

The trouble really comes from the desire of the western farmer for big business. Hogs on the average farm are or should be a kind of side product, exception being made in the case of the man with great natural aptitude for hog raising or with a taste for producing a good quality of pure-bred stock. Hogs in large numbers go wrong easily and go wrong badly with the fellow who has no eye for the care and condition of a hog; but every farmer should be in, and in all the time, for the economical production of his own meat, and for a smaller surplus besides, according to how well he likes the business. The commercial agriculture bog has got hold of us in rather aggravated form. With many people it stands for the practice of selling everything you raise and buying what you need or rather want. The buying habit favors the development of wants beyond need. It does not pay to sell four cent beef to buy thirty cent bacon just to prove that your farm business is a real commercial enterprise. The right copception of the commercial idea in relation to farming is the careful use and conservation of the plant and the economical production of precious commodities to the limit of the resources of the plant.

Home-Making and the Hog

We can even modify further our conception of commercial agreculture. The first claim on business enterprise is home-making. Most of us will have to assimilate our land enterprises to this conception. So far land holding has been three-fourths speculation and one-fourth home-making, but the easy outside money has quit coming and land values are being determined by

THE HORSE

The War Horse.

Why am I left upon this barren field,
A horse whose master never more will call—
Wounded and bleeding where a cruel ball
Did pierce me through; while all around me rise
Moans of the dying handicapped like me?
Men call it war, and claim 'tis ours to bear
Heroes into the fray; and, when they fall,
To agonize and suffer, e'en as they.
Yet, wherefore, if there is no life beyond
For such as we, should suffering be borne
That calls for Christian faith and martyr's blood
Proudly we learn to step to martial notes;
Madly we sniff the battle from afar;
Bravely we bear a hero to the strife;
Yet when he falls, though we like him are torn,
With murderous shot and shell and moaning lie,
Why must we bear the agony and die
Uncared-for where we fall? God's love enfolds
His meanest creatures; horse and man, alike,
Are folded in the mantle of his care.
Oft on the battle-field man leaves us where
We drop our burden. 'Tis a horse can tell,
Writhing in agony, why "war is hell."
—By Helen M. Richardson.

Care of the Mare.

As the period of gestation varies in individuals and sometimes in the same mare in successive periods, no one can state with reasonable preciseness when foaling will take place.

The approximate period is usually stated at 11 months, or 330 days, and it may be most safely stated that it will vary from 322 to 346 days. In extreme cases foaling has been delayed until 400 days have elapsed, and first pregnancies often last a year. Where parturition is delayed it is often accepted as an indication of a male foal.

A farmer, who, in his anxiety to give intelligent care to the mare that he believes is in foal, wishes to register the earliest symptoms of pregnancy, should, says Mr. H. W. Potts, in the 'Agricultural Gazette" of New South Wales, on the cessation of oestrum or heat, note any enlargement of the abdomen three or four months after, although this is not always notiecable, particularly with fillies. A slight falling beneath the loins and hollowness of the back may be present, or the udder may be observed to change its shape, becoming rounded, firm, and free from wrinkles, and the teats more prominent. These changes in the udder come and go during the period of gestation. A steady increase in weight daily after the fourth or fifth month is a sound indication, as well as the swollen and reddish state of the vaginal mucous membrane.

After the seventh or eighth month the movement of the foal may be deteced by the hand or fist being pressed firmly against the abdominal wall in front of the left stifle. An examination after the mare has had a drink, or during feeding, will find the foal moving in the womb.

During Gestation

Treatment during the period of gestattion must be directed on common sense lines. A draught mare may be given steady work up to within a few days of foaling—in fact, she is all the better for it—but a walking pace should not be exceeded, and any strain or strenuous effort should be avoided, especially as the period of foaling approaches. Shaft work is generally associated with the possibilities of accident or over-exertion, and should be discarded. If a mare is a noted sweater, then over-exertion should be avoided, seeing that its continuance may interfere with milk secretion. The bowel discharges require to be watched, and constipation corrected by bran mashes and green foods. The main diet has to be arranged in order to meet the demands of mother and foal. Good chaff and a little grain, and other foods rich in those elements which form flesh and bone, may be required to supplement grazing.

Symptoms

The ordinary symptoms of approaching parturition are familiar to most breeders. The abdomen becomes more pendulous, the udder is enlarged, the teats thickened and extended, and the muscles of the croup less prominent, while the lips of the vagina enlarge and appear slightly parted. Often there is a viscid discharge. The waxy substance found on the opening to each teat drops off about twenty-four hours before foaling and milk may flow from each teat on the application of pressure. At times the teats do not fill until after foaling. Sometimes the wax on the teats is absent; and yet again in other cases the usual symptoms of milk formation in the udder are delayed until after foaling. When the time for foaling approaches the mare becomes uneasy and excited. Lying down, elevating the tail, and straining, are all marked symptoms of pains. These become more frequent until the climax is reached. Natural parturition is rapidly and easily accomplished. A mare may be seen grazing comfortably and on revisiting her half an hour later she may again be found complacently grazing, but this time with her foal at foot. It is well to give the mare at least one bran mash daily for two or three days, the aim being to avoid giving her any class of food likely to cause constipation. The after-birth, which, as a rule, is naturally ejected in from three to eight hours after giving birth to the foal, should be buried or burnt.

Bog Spavin.

Bog-spavin is one of the most troublesome diseases of the hock, not so much because it is at all a common cause of lameness, or incapacitates the animal from work, as because to the owner, who is generally greatly concerned as to the probable consequences of the enlargement, it is a constant eyesore. It undoubtedly depreciates the value of the animal if offered for sale, and treatment for its reduction is not attended with any great measure of success. These re marks, so far as they relate to the enlargement being more in the nature of a blemish than a cause of lameness, apply, however, to only one form of enlargement, for there are two kinds of bog-spavin, identical in appearance externally, and occupying the same situation, but very different in their importance and effects.

Two Kinds of Bog-Spavin.

The least serious form consists of an excessive secretion of synovia or joint oil, or of a dropsical effusion into the cavity of the joint; and the more important, of inflammation of the joint due to sprain or other injury. Fortunately the least important form, as regards the occurrence of incapacitating lameness, is the most commonly met with, and, but for the eyesore and the possibility of its assuming an aggravated form would attract very little attention. Such blemishes must not be regarded as constituting actual unsoundness, but they certainly depercíate the value of the animal commercially. Hence the desire for their reduction. Bog-spavin may be, indeed generally, associated with faulty conformation, and thus attention is directed through it to the shape and character of the hocks, which are joints that it is most important to have perfect.

Ordinary Bog-Spavin

The characteristics of ordinary bog-spavin are a soft, puffy, fluctuating swelling, suggestive to the touch of a windgall, as the wellknown swellings about the fetlocks of hard-worked horses are called. It is distinguishable from the swelling associated with sprain by the absence of heat and tenderness to touch, and of anything like severe lameness when at work. This period at which soft swelling most commonly makes it appearance is when the young animal is first taken into work, or during the breaking-in process. More rarely it is developed while still running in the field, and it then arises from galloping or jumping in play or mischief, which are, of course, causes of concussion and strain. As it is just at the time when the owner is thinking of putting the colt into work or of converting it into cash that the swelling appears, it is generally more seriously regarded as a bar to usefulness than there is any occasion for. The purchaser, especially if a dealer, may be trusted to make the most of the blemish, even if he is sufficiently experienced to recognize that the swelling is of small importance. We can hardly blame him for providing against possible untoward consequences by offering less money than the animal would be worth if perfect, for he may presently be a seller, and in turn have to listen to the molehill being magnified into a mountain.

Treatment Undesirable

To the owner of a horse with a bog-spavin that does not cause lameness, and especially if he intends to keep it for work, we offer the advice let it alone, since the results from treatment are rarely in proportion to the time occupied and the expense incurred. When treatment is resolved upon it is practically the same as that for thoroughpin, with which bog-spavin is often associated. Bog-spavin trusses, for the reduction of the swelling by pressure, are sold by veterinary instrument makers, but the remarks concerning the similar appliance for thoroughpin apply with equal force here, and readers should refer to them.—Veteran.

Winter Management of Foal.

During the first winter, foals need particular care. Any neglect during this season is bound to result in arrested development. Foals have not the hariness of the older young horse stock, and as in their first year foals make their best growth it is essential that they should be generously fed.

Feeding

This in the winter season will consist of a liberal amount of hay, a fair allowance of grain, a little bran, a little straw chop as fill-belly and to aid digestion, and some chaff mixed with the oats; a liberal allowance of sliced roots also will be advantageously fed to take the place of the grass which is lacking at this season.

The hay which is supplied to the foals should be the best and sweetest that is available, and there should be no stinting. Meadow hay is the best, but a little clover hay may also be fed as an adjunct to it. As to the exact quantities of oats that should be fed, something depensd on the breed of the foal, and there are other considerations; not a few farmers hold that foals can do altogether without any, but without a fair amount of oats foals cannot thrive and grow properly in the winter. The grain should in all cases be served out with a liberal hand, and, as regards this, one must be guided by the condition of the foals. When a foal is backward, or not in sufficiently good condition, its allowance of oats should not be increased. The grain should be served in a crushed state throughout the winter, and should be divided into two portions, one being given in the morning and the other late in the afternoon.

Bran is an excellent food for foals, and up to a couple of pounds per day may be usefully fed. Then the allowance of oats need not be so large. In the case of backward, unthrifty foals, it is a good plan to include about a pound or so of crushed linseed cake a day, or in the case of Shire colts, a couple of pounds, if the expense is no object. In due moderation, linseed cake is useful when a foal needs special attention. We have said a little straw-chop may usefully be served along with the corn, but nothing is gained by feeding it to foals, since though useful as a fill-belly it does not satisfy their needs as regards nutriment. There is no harm in placing some sweet oat-straw before the foals to pick at will; oat-straw, however, is more suitable for yearlings, and two and three-year-olds. Sliced roots, served with a liberal hand will help to keep their bowels in good order, and prove beneficial in other ways.

Housing

It is decidedly to be recommended that foals be always housed in comfortable quarters overnight. They

should not be let out of a morning until the early rawness has worn off, and before being turned out they should have a feed of grain, etc., and be foddeerd. A straw yard, with good shedding, serves admirably as night quarters for foals in the winter, while an empty barn also answers very well, indeed there is nothing better.—English Exchange.

Carrots for Horses.

Carrots possess a great dietetic value, and they exert a laxative effect upon a horse's bowls. This effect is due to their succulency, about 85 per cent. of the weight being water. Carrots are thus a most useful supplementary food for stabled horses when green forage is not available, and their use for horse-feeding purposes is greatly to be recommended. They promote the general health of a stabled horse, and help to produce a good gloss upon the coat. But they do not prove as laxative when fed in small quantities as is oftentimes supposed. The laxative effect of a daily allowance of three or four pounds of carrots is not particularly marked, and as a rule when this quantity of carrots is fed daily to stabled horses bran mashes at stated intervals ought not, as a general rule, to be dispensed with altogether. A daily allowance of as much as six or seven pounds of carrots can well be fed daily to stabled horses without having very marked laxative effect upon the bowels. Even when this quantity is provided an occasional bran mash will be required in order to maintain the bowels in the right working order. Owing to the cost of carrots it is usually not practicable to feed as much as six pounds per day, but such an allowance may be fed with great advantage when a plentiful supply admits of this being done. Seven or eight pounds can be fed each day if desired. There is no necessity whatsoever to cut them up into slices or pieces; in fact, it is not advisable to cut them up, as when this is done there is some risk of the horse being choked through a piece of carrot sticking in the throat. This risk may not be very great, but that is no reason why it should be run. Carrots must first be freed from the earth sticking to them, and should be washed, if necessary. They have a soothing and emollient effect upon the mucous membranes of the throat, and it is, therefore a good plan to include a liberal allowance,—say, up to eight pounds, or even nine pounds—in the diet of horses suffering from cold or cough. When owing to sickness a horse is off its feed it frequently relishes a few carrots in preference to other food. and the appetite of a sick horse can often be tempted in this way. Finely chopped they form a uesful kind of appetizer for mixing with other food when a sick horse does not eat his food properly.—G.

How Colds are Contracted.

The popular idea is that colds and the bronchial and pulmonary troubles that follow in their train invariably result from exposure to cold, wet, and inclement weather. In some cases they may arise from these causes, but the majority are due to causes exactly the reverse, and more colds are contracted form breathing a close, impure atmosphere than from being exposed to inclement weather in the open. A horse used to a warm stable and clothing, and perhaps newly shorn of its coat, seems to take no harm when turned out in cold weather, provided that it is well fed, while the same animal, brought from apparently uncomfortable conditions outside, exposed to wet and every wind that blows, and placed in a stable with other horses, almost certainly develops a bad cold and cough. Colts, when first brought under cover, especially in a stable that has other occupants, are pretty sure to cough and run at the nose, and they often require most careful nursing to avoid pulmonary complications and permanent affection of the wind. In bringing in colts for breaking purposes, it is a bad plan to put them in a stable with other horses. They are pretty sure to go wrong, and this, of course, interferes with their training. They should be put into a shed or roomy box stall that is well ventilated, and gradually accustomed to the change from a life of freedom in the open air, where there is room to breathe as well as to move.

Gombault's Caustic Balsam

The Worlds Greatest and Surest
Veterinary Remedy
HAS IMITATORS BUT No COMPETITORS!

SAFE, SPEEDY AND POSITIVE.

Supersedes All Cautery or Firing. Invaluable as a CURE for
FOUNDER,

Police Horse Swims to Rescue.

While bathing off the beach near Throgg's Neck, Long Island, Mrs. Catherine O'Daleen suddenly became exhausted and called for assitance. The first to respond and to reach the drowning woman was the horse of Mounted Policeman O'Brien, who bore his rider without urging to the side of the struggling woman, then wheeled and dragged them both to shore. Great applause from the crowd on the beach greeted the rescuers and while the woman was being resuscitated, hundreds of men and women gathered around the horse who stood at attention and received their praise and pettings.

SYDNEY BASIC SLAG.

We strongly recommend all farmers to arrange for their supplies without delay. The demand is constantly increasing and it looks as if there will again be a shortage next season.

Our general Sales-agent for New Brunswick is :

POULTRY

The Influence of Soil and Climate.

It is often imagined that the reason why poultry-keepers of other lands have always been so successful is because they are more favorably situated than we are as regards soil and climate. When it is asked why we have to import such huge quantities of eggs from abroad we are told that it is because fowls of other lands are more prolific, the result of their living under more favorable conditions. Never was there made a greater mistake. To say that our climate is responsible for the importation of such vast quantities of eggs and poultry is altogether wide of the mark, and will not bear close examination. It is just as easy to produce eggs in England as it is in Italy, for instance, or table fowls in Scotland as it is in France.

England's Premier Position

For generations and generations past England has held the premier position in the breeding of high-class stocks of all kinds. The skill and experience of our breeders have, of course, played an exceedingly important part in maintaining the high standard of excellence, while the somewhat cramped conditions under which our people have had to work, and the consequent rigid selection of the breeding stock, have likewise exerted an influence. At the same time, had the conditions been unfavorable, or at any rate as unfavorable as many would have us believe, this high standard of excellence could not possibly have been maintained.

Climatic Conditions Abroad.

This applies to poultry in the same way as it does to larger stock. We have only to examine the conditions in the countries from whence we have been in the habit of importing our huge supplies of eggs to realize that we are more favorably situated than they are. In Russia and the Netherlands the exetremes of temperature are far greater than in the United Kingdom. In France, Italy, and Austria-Hungary the winters are far colder and the summers far hotter than they are with us. In the United States one of the most successful poultry-keeping countries in the world, the climatic conditions are not nearly so favorable. As a matter of fact, we are most fortunately situated, and we cannot fairly blame our climate for our lack of success in the past. It is quite wrong to suppose that very hot summer are advantageous. Those who have travelled in the States or in many countries of Europe during the summer months will bear me out in this, for they must realize that the scorched pastures and the dried-up streams cannot possibly be beneficial. There is no doubt but that one of the reasons, if not the main reason, why fowls in Southern Europe are so small and of such poor edible qualities is due to the intense heat of the summers. The less extreme the temperature of both summer and winter, the better it is for stock of every kind.

The Question of Soil.

Soil also plays an important part in the health and prolificacy of fowls. When selecting a breed for a certain locality or for a certain purpose, the nature of the soil should always be taken into consideration. This is proved by the fact that if a breed of fowls is exported, say, to Australia, frequently it changes in many of its chief characteristics. Even in the different countries of Europe this is the case. Examples could be given were it necessary to do so, but probably nineteen out of every twenty poultry keepers have observed this for themselves, without perhaps divinging the cause. As a general rule, it may be accepted that white-fleshed fowls thrive best on a light soil, that those with grey flesh and legs do best upon a medium soil, while those with yellow legs and flesh thrive anywhere, even upon a heavy clay.

The Non-Sitters

So far as number and size of eggs are concerned, the non-sitters are our best fowls. These are small, active breeds, usually very hardy, rapid growers, and poor in their edible properties. They are mostly spring and summer layers, although when they are hatched at the right time of year they may be depended upon to produce a certain number of eggs during the winter months. They cannot, however, compare with the general purpose varieties in this respect. Without exception they all produce white-shelled eggs. The following are the conditions best suited to them:

Soil. Breeds recommended.
Clay— White, brown or buff Leghorn, Ancona, Redcap.
Medium—Black Minorcas, Andalusian, Houdan.
Gravel— Any non-sitting variety.

The General Purpose Breeds

These are the birds which combine both egg-producing and edible qualities. They are more prolific than the table varieties, although their meat properties are not quite so good, while they are better on the table than the non-sitters, although they do not produce so many eggs. The hens are quiet sitters and reliable mothers; the chickens grow fairly quickly; the cockerels make capital table birds. General purpose fowls are the best winter layers we have. They all without exception produce tinted-shelled eggs. The following are the conditions under which the general-purpose breeds thrive best:

Soil. Breeds recommended.
Clay— Plymouth Rock, Wyandotte, Light Brahma.
Medium—Wyandotte, Plymouth Rock, Langshan, Orpington.
Gravel— Any of the above breeds.

The Table Breeds

These birds excell in their meat or flesh-producing properties. They are generally large, with a deep and broad body, a perfectly straight and long keel, carrying a large amount of white meat upon the breast and wings. Their bones should be soft. Rapid development and readiness to fatten are also important features. The following are the conditions under which the respective breeds thrive most satisfactorily:

Soil. Breeds recommended.
Clay— No table variety thrives well on clay soil.
Medium—Faverolles, Indian Game, Sussex.
Gravel— Dorking, Gabe, Sussex.
—Expert, in English Exchange.

Too Many.

Do not make the mistake of wintering too many birds. Over and over again it has been proved that it is much easier to get a higher percentage of eggs from a small flock in a given space than from a larger number. Indeed, I have known many instances of a breeder disposing of one-fourth his flock and then getting as many eggs as he got before.

Think what a cut it makes in the profits, with grain at the present high prices, to be practically feeding one-fourth your flock for nothing. But it may be even worse than that, for often when birds are overcrowded, though given the very best of care, they refuse to lay altogether, which of course means a dead loss of everything fed to them. Not infrequently when a portion of my flock was doing badly through the winter have I received the most glowing reports from previous customers of the work of birds I had sent them from this very part of my flock. I do not think in these cases the purchasing parties could have given their birds any better feed or care, but they could give them proportionately more space; and space is something that must always come into prominent consideration in the profitable keeping of fowls.

The breeder is justly deemed "lucky" who is found when fall comes with a lot of nice pullets, but his luck is bound to go a-glimmering if he tries to carry too many of them through the winter. They may continue to develop and mature satisfactorily as long as they have plenty of room, through ability to run out on the ground, but close them up with the coming of cold weather in too limited quarters, and they will soon be found going backward instead of ahead. Their formerly bright heads will become pale, their combs shrunken and their manner will show none of the alertness which characterizes the bird about to lay. A lot of grain will then have to be expended to rally them from this lapse, and meantime probably the most profitable period for market eggs have passed.

There is always a good demand in the fall for stock well calculated to make winter layers, and while it may seem hard for us to part with young and vigorous hens, partly through moult or rapidly-maturing pullets on which we have expended much time and trouble, it is infinitely better to let them go at a fair price than have snow come and find ourselves overstocked. There is certainly no money in hens nowadays unless each individual is made to yield close to its greatest possible profit, and this can be done only by giving the birds ample room.—John L. Woodbury in Maine Farmer.

PEERLESS PERFECTION
Horse High — Bull Strong — Pig Tight
It's made right—from high grade material. In the construction of our PEERLESS FENCING we use Open Hearth steel wire. By this process impurities are removed from the metal, thus eliminating one of the chief causes for the rapid rusting of fence wire. PEERLESS is guaranteed to give you satisfaction. Send for catalog. Agencies nearly everywhere. Agents wanted in open territory.

Winnipeg, Man., Hamilton, Ont.

Whitewash Banishes the Mites.

If you are going to be a successful poultryman, young man, you must get after those mites. They sap all the life out of the hens and cut down the egg supply enormously. They kill off large numbers of the most promising chicks. They are the worst enemies with which your flock has to contend.

But you can get rid of them if you will. Have a thorough housecleaning some fine day as soon as possible. Clean up the dirty floor. Take out the roosts and scrape them, and clean out the dirty nests. If they are too badly infested, burn them up and make some new ones. Brush down the cobwebs from the corners.

Then take a spray pump and spray the whole inside of the poultry house, getting into all the cracks and corners with a mixture of one part crude carbolic acid to ten of kerosene. This kills any of the mites which may have fled to the cracks and crevises for safety. After this is dry, put on the whitewash It may be put on with the same spray pump, but it sticks better and lasts longer if it is put on with a brush. Lice and mites can't stand whitewash.

After the whitewash has thoroughly dried, refit the house with clean roosts and nests, and put some clean straw on the floor. If you wish, you can dust the hens off with lice powder before admitting them to the house. Repeat dusting again in about a week, or, better, apply the blue ointment. It is a very good time to do the job. If you will do this, you will find that the lice have departed for some other henhouse, whose owner is not so good a poultryman as you.

To improve farm flock, cull out the slow growing chickens; the old hens with long toenails; the long or "crow-headed" hens; the poor winter layers; the hens that stay on the roosts.—Maine Farmer.

Blackhead in Turkeys.

Turkeys are exceptionally scarce in all the western provinces this year. What is the cause? Last year they were plentiful and cheap; this year they are scarce and dear. Probably because they were cheap last year, a good many growers forsook the raising of turkeys. Undoubtedly, heavy losses resulted from the continued wet weather. There is a possibility that many birds died of "Entero-Hepatitis," or Black-head. While this disease is common to all species of fowl, it is usually seen in its most aggrevated form in turkeys. Losses in the United States have been enormous, and in many instances whole flocks died off before the owners knew what was wrong.

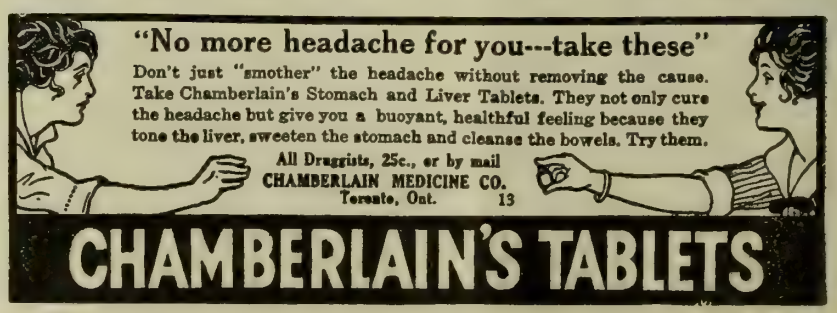
The disease is most sweeping in its effect, and it would pay every turkey-raiser to acquaint himself with its origin and course, its prevention and cure. Bulletin No. 17, Health of Animals branch, Dominion Department of Agriculture, just issued, deals with it most comprehensively. The following excerpts will prove of value:

Nature of the Disease.

The early symptoms presented by affected birds are not particularly characteristic. Affected birds, however, will separate from the remainder of the flock. This separation or lagging behind does not appear to be a desire for seclusion but the result of being unequal to the task of keeping up with the others from physical exhaustion. The droppings are more fluid than normal, and may be streaked with yellow. Gas bubbles may be sufficiently numerous to give a frothy appearance.

The head may be, and usually is, darker in color than normal. This dark coloration may disappear and reappear at irregular intervals while the bird is at rest, but excitement usually causes a bright red coloration.

The best means of early diagnosis is the examination of the droppings for evidence of diarrhoea or a yellow coloration of the faesces. Feeding time may prove the most appropriate for such observation. Where this is not convenient, owners should provide some means of determining an infection at the earliest possible moment.



"No more headache for you---take these"
Don't just "smother" the headache without removing the cause. Take Chamberlain's Stomach and Liver Tablets. They not only cure the headache but give you a buoyant, healthful feeling because they tone the liver, sweeten the stomach and cleanse the bowels. Try them.
All Druggists, 25c., or by mail
CHAMBERLAIN MEDICINE CO.
Toronto, Ont. 13
CHAMBERLAIN'S TABLETS

Course of the Disease

Affected birds, if untreated, may die in a few days or may linger for a week or longer, after the first appearance of symptoms, according to the virulence of the infecting agent. In some cases the onset is so rapid and free from outward manifestations as to be recognizable only by an autopsy. Without treatment, or a complete change in diet and surroundings, the course is usually fatal.

Prevention and Treatment

All affected birds should be isolated at once.

The placing of the poults on clean, sanded board floors in a dry, well-lighted and well-ventilated building with a southern exposure, is considered a means of prevention. This continued contact with the floors, however tends to weaken the poults. We believe it to be an advantage to see that they are quartered on sanded board floors at night, and prevented from ranging at the early morning when the grass is wet. When the birds are older, the roosting places should receive consideration. The free application of lime and sulphur wash (that used in spraying fruit trees is suitable,) on the ground under the roosting places, and the ground on which they are reared, two or three times during the season, will destroy any infection on the ground.

Some apparently remarkable recoveries have followed the use of muriatic acid, but one cannot hope to bring all affected birds through an attack.

The acid to be used is a teaspoonful of muriatic acid. (Acid. Mur. Dil. B.P.) in a quart of drinking water. This acidulated water should be placed in a porcelain or glass vessel, and is suggested in the hope that the birds may be brought through an attack sufficiently to be placed in marketable condition.

Treatment of Hen Manure

We find coal ashes to be the best material to keep hen manure in nice shape. We do not have dropping-boards, but have the long space under the roosts partitioned off, in order to keep out the litter and every two or three days, or when it seems necessary we throw sifted coal ashes under there. If the ashes are not sifted when we get them, we put them in a shallow box, with wire screening for a bottom —about half-inch mesh—and as we slide it along on the two by three roosts, we shake it rapidly, and in that way get it well distributed. When there is an accumulation of six or eight inches, we remove it to a building where it is kept perfectly dry until spring. Then we use it on all kinds of crops, sometimes in the hill or row, but usually apply it with a lime broadcaster. If you use care in keeping out the litter—we have a partition about 16 inches high—there will be no trouble in running it through a broadcaster. If your droppings come up in lumps, from not using enough ashes, then shovel them into a pile against the back wall, the whole distance, and then throw some cracked corn or wheat over them, and your biddies will scratch them until they are fine and nice. This is perhaps beside the question, but I think most farmers do not pay enough attention to hen manure. Last spring we set out a number of apple trees. The only manure used under the trees was hen manure, about a shovelful mixed with the soil in the bottom of the hole. The ground was planted to sweet corn and was fertilized with a corn fertilizer. At the last cultivation turnip seed was sown broadcast over the piece, and special pains taken to get plenty of seed around the trees. While that hen manure must have been six or eight or more inches under ground, the turnips close around the trees are today two or three times larger than those elsewhere.—L. in Maine Farmer.

Chemical Control of Egg Laying.

For several years the Maine station has carried on experiments on the general physiology of the egg-laying process in hens. The underlying idea in these studies has been that before the farmer and poultryman could gain the desired control over egg production, it would be necessary to learn more in regard to the mechanism by which eggs are produced. Eggs are produced by the organ commonly called the egg cluster. The problem studied is of the controlling factors in the working of this organ.

The station has found that a definite chemical substance, called "yellow bodies," controls the activity of the egg-laying organs. If a little of this substance be injected into a hen in active laying, it stops the activity of the oviduct immediately and completely. Other chemical substances lack this specific power. After such inactive substances are injected the bird goes on laying just as well as before.

The next step was to find out how to start activity of the organs when the hen was not laying. Experiments along this line are not yet completed, although progress is being made. Certain substances give promise of favorable resutls because of their known action on cattle, but these have so far failed to bring about the expetced results in poultry. There is, however, good reason to believe control may be made by chemical means.

The work will be continued at the station as opportunity offers. The favorable effect on egg production sometimes gained by cayenne pepper or mustard is not due to activity of the egg organs. The stimulants act as a mild stomach tonic, better enabling the hen to handle her rations, thus producing eggs.

Missouri Contests Close Soon.

The Missouri egg laying contest, with 50 pens of five hens each, at Mountain Grove, Mo., closed on November 1. The total number of eggs laid in September was 3002. The National contest being conducted at the same place with 79 pens of five hens each, closed at the same time. In the Missouri contest White Leghorn hens owned by J. R. Mooney, of Butler, Mo., won the September cup by laying 100 eggs. Single Comb Rhode Island Red fowls owned by Woodman & Smith of Wycombe, Pa., won the cup in the National contest with 94 eggs.

Goose, Turkey and Duck Quills.

Before the war the supplies of goose, turkey and duck quills used for commercial purposes in England were obtained mainly from Austria and Germany, but since the outbreak of the war these imports have ceased. The present supplies are inadequate for the needs of the manufacturer and there is a steady demand for quills of good quality, says the Smallholder.

The following scale of prices, which vary according to quality, will afford a guide to the present value of suitably selected quills:

	Per cwt.
Large goose quills	$12.16 to $14.60
Small goose quills	7.30 to 9.73
Large turkey quills	12.16 to 14.60
Large duck quills	6.08 to 7.30

The quils should be tied in bundles weighing about 8 ounces, with the barrels all pointing in one direction. If possible, they should, for the sake of convenience in transit, be put up in lots of not less than 56 pounds.—Claude Dyer, Leeds, Eng.

WHOOPING COUGH

No cough sufferer old or young can take Veno's Lightning Cough Cure without benefit. In whooping cough its quick, sure relief is truly startling. Mothers who do not know Veno's often think that whooping cough must go on until the season changes. They are wrong. Veno's cures whatever the season, cures at once and cures thoroughly.

Won Grand Prix and Gold Medal, International Health Exhibition, Paris, 1910.

There is nothing in Veno's Lightning Cough Cure that the most delicate child may not take freely. It contains no opium, morphine, or paregoric. The curative power of Veno's comes from strengthening principles which enable the breathing organs to throw off attack and not from narcotic drugs. It may be used with fullest confidence for old or young. Only real and speedy benefit can result. Veno's is the remedy for—

Coughs and Colds
Bronchial Troubles
Nasal Catarrh
Hoarseness

Price **30** cents.

Difficult Breathing
Whooping Cough
Blood Spitting
Asthma

Large size containing 2½ times the quantity 60 cents. Sold by Druggists and Dealers everywhere, or direct, on receipt of price, from the sole agents for Canada, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto.

VENO'S LIGHTNING COUGH CURE

Kidney Disease Cured Sworn Statement

Of Mr. Wesley Maxwell, Who Gratefully Gives All Cred to Dr. Chase's Kidney-Liver Pills.

It is one thing to make big claims for a medicine and quite another thing to produce irrefutable evidence that it actually cures in serious cases.

We prefer to let the cured ones speak for themselves, and that is why you find in almost every newspaper the report of someone who has been cured by the use of Dr. Chase's medicines. Today we present the sworn statement of Mr. Wesley Maxwell. When a man goes to this trouble in expressing his gratitude there can be no question of the benefit he has received. Mr. Wesley Maxwell, Orangeville, Ont., writes: "I have been using Dr. Chases' Kidney-Liver Pills, and I must tell you that before I started using them I could only make water with the greatest difficulty, and had very severe pains in the back. I am completely cured now by the use of these pills. Before that I used a lot of doctor's medicine without any benefit that I could see. I am thankful for being cured, and can recommend Dr. Chass'e Kidney-Liver Pills very highly."

SWORN STATEMENT

"This is to certify that I, Wesley Maxwell, of the Township of Caledon, was cured of kidney trouble by taking Dr. Chase's Kidney-Liver Pills.

'Wesley Maxwell."

(Sworn before me as correct this 6th day of January, 1915.—Wm. Hawkins, Sen. Justice of the Peace.)

This statement is also endorsed by the Rev. Geo. W. Robinson, who is Mr. Maxwell's pastor.

This cure will interest a great many people who are suffering as Mr. Maxwell was with kidney and urinary troubles. It will only cost you a quarter to buy a box of Dr. Chase's Kidney-Liver Pills and put this medicine to the test. We are sure that you will be thankful to the writer for describing his cure to you. For sale at all dealers, or Edmanson, Bates & Co., Limited, Toronto.

FOR HOME AND COUNTRY

This Department is devoted to the best interests of the Homes of the Maritime Provinces. Contributors to these columns are leaders in the "For Home and Country" movement. This Department is yours. Use it to the best advantage by sending us timely suggestions, short articles dealing with your experiences, and reports of your Institute meetings.

When Hiram Missed the Mark

(By Jennie Ford Thompson in New England Farm and Home.)

"Next Tuesday is election day," remarked Mrs. Barton, as she bestowed a last vigorous rub upon the stove she was polishing and stood back to admire her work. Her husband stirred uneasily in his chair.

"I really ought to have some new slippers," he replied, irrelevantly. Then, as his wife made no reply, he squirmed again, and let his paper fall to the floor. "This woman suffrage business," he commented, not looking at her, "the papers are full of it. It makes me sick! I'd hate to have a woman who'd go running around to 'lection and such places, neglecting her house and letting her family go to smash!"

Mrs. Barton smiled upon her husband, with puzzling brightness.

"My house isn't neglected, is it, Hiram?" she queried, with a complacent glance about her tidy kitchen.

"I should say not! And I'm mighty glad you haven't got any such moonstruck ideas in your head."

Mrs. Barton made no reply, but her smile was as sweetly complacent as before, and after watching her uncertainly a moment, Hiram arose and strolled out to the barn.

During the following week the coming election was not alluded to by either Hiram or his wife until Saturday evening, when Mrs. Barton observed:

"I think I'll go to town with you Tuesday, Hiram."

Hiram feigned surprise.

"Oh! was you thinking of going? Now, that's too bad! You ought to have told me before, for I've went and engaged the corn shellers, and they'll sure be here on Tuesday."

She cast a quick look at him, then glanced down.

"Oh, that need make no difference," she replied. "We can go directly after dinner."

"But the dishes," he objected, weakly. "You surely won't go and let them stand!"

"Why not?" she queried. "I have left them before."

"Well, suit yourself of course," doubtfully, "but I wouldn't form such habits." Mrs. Barton's only reply was her own curious little smile, and the subject was dropped.

All the next day Hiram racked his brains to find some plausible excuse for keeping his wife at home, but none could he find until on Monday, when Joe Myers' hired man expressed a desire to go to election. Hiram eagerly offered the use of his buggy and Bessy, his driving mare, which surprising offer was eagerly accepted.

Tuesday came and with it the corn shellers. Early Tuesday morning Bessy was harnessed to the light buggy and slyly driven out and delivered into the hands of Joe Myers' hired man.

Serenely unconscious of her husband's manoeuvre, Mrs. Barton bustled about the house, preparing dinner for the hands. Pies, flaky crusted and dainty marked and pinched, were set out on the long shelf on the screened porch to cool; various hissing sounds of stewing, roasting and baking issued from the kitchen door, and mysteriously delightful odors floated through the open windows.

The shelling was in full swing when Hiram, going suddenly around the barn, almost collided with a figure that had been creeping and peering around the corner, and which now scrambled hastily to its feet.

It was a man, very ragged and very dirty, with rough, tousled hair and beard and a cringing half-hearted manner that marked him a common tramp.

Hiram viewed the fellow's sodden bulk with a brooding frown.

"What are you doing here?" he demanded, sharply.

The fellow shifted uneasily, keeping a furtive eye upon the pitchfork Hiram carried.

"W'y," he returned in raspy, wheedling tones, "I jest thought as how you might let a feller stay to dinner."

"Well," Hiram glanced back at the workers, "I'm not in particular need of an extra hand, but I guess we could give you a chance to shovel till noon."

The tramp drew back. "Oh, say now," he whined, "I ain't lookin' fer a job. I've walked quite a ways, an' I thought I'd like to rest up a little till dinner time."

Hiram's eyes hardened. He raised a sturdy brown fist.

"Now, you git," he ordered, and the tramp got.

A well-prepared feast was gracing the long table when the hungry horde trooped into dinner. The shelling was finished just at noon, and an hour later men crowded into the wagons and started for town, five miles distant.

Hiram lingered about the house in an unaccountable manner, while his wife hurried around clearing the table and piling the dishes into the pans. Presently she spoke.

"Hadn't you better be hitching up, Hiram I'm almost ready."

Hiram's start of surprise was rather over-acted.

"Why, did you mean to go?" he asked innocently. "I wish I'd known that. I've went and let Joe Myers' man have Bess and the buggy! Thought you'd given it up. I couldn't have gone anyway. I've got some fence to fix."

A very small spark glimmered in Mrs. Barton's black eyes, but she regarded her husband with her old inscrutable smile.

"Oh, well," she returned affably, "that need make no difference. I thought perhaps that you wouldn't want to wait for me, so I arranged to go with Mrs. Myers."

Hiram gazed helplessly at her a moment, then turned round abruptly and strode out to the barn. He entered Bessy's empty stall and stood there moodily kicking his heels against the manger. The roll of wheels passed the barn, but Hiram did not glance up.

"If that woman don't beat all," he muttered. "I just knew that smile meant something," His mouth twisted half humorously. "I'll bet she knew all the time what I was about. Somehow, she always does. I wonder how 'twould do now if I was to come right out and forbid her to go? I believe I'll try it." And, assuming a resolute and courageous air, he marched back to the house.

Somehow, as he neared the kitchen door, the task he had set for himself loomed larger and larger. On the step he halted in uncertainty. Perhaps he ought to reason with Emily. If she had only said what she meant to do, he would know what to say to her then. Perhaps she wasn't intending to vote. He believed he'd ask her.

He looked into the kitchen. His wife was not in sight. The pantry door stood partly open, the key in the lock. Perhaps she was in there. He listened. Yes—he could hear her moving about.

Just then a sudden diabolical idea entered his head. His eyes glowed with sudden resolution. He tiptoed lightly across the floor, pushed the door softly shut, turned the key and dropped it in his pocket. Then, as silently as possible, he hurried out of the house and away across the fields, where there was some fence that needed mending.

"I've fixed it this time," he chuckled. "That's once I turned the trick! I guess she won't like it much, but I won't have it said that my wife went to election," he concluded grimly.

He had declared—though not in Emily's presence—that his wife should never vote; and now, as he reached the broken fence and set to work, he thought grimly that, for this time at least, she would not.

Down the hill a buggy came driving.

"Hello, Hi," called the occupant genially, "Ain't you goin' to 'lection today?"

"Guess not, Steeve. Horses all been to work and I lent Bess."

'Well, get in and go with me, can't you? I come back right past your house."

Hiram hesitated. Dared he leave Emily a prisoner so long? There was only one window to the room, and it was small and high. She couldn't possibly get out. Then he reflected that he would have to keep her there anyway until it was too late to vote, for she would find or make a way to go to town if she really wanted to go.

"Well," he replied doubtfully. "I ain't fixed up any."

"Oh, that's all right," the other assured him. "A fellow doesn't have to fix up to vote." And with a guilty feeling that he wasn't playing the game fair, Hiram climbed into the buggy and was driven rapidly off to town.

Arrived there, he stoped short. What was the matter with his eyes, he wondered.

A woman was just coming out of the store ahead of him, and if he wasn't drunk or crazy or something like that, that woman was his wife.

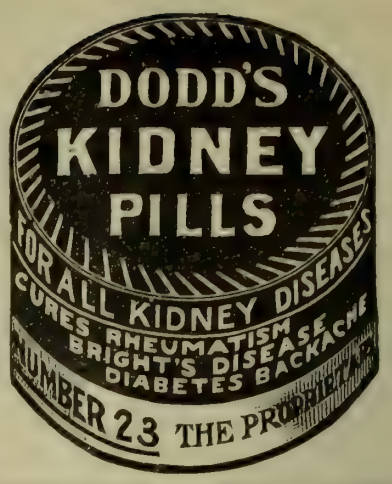
He brushed his sleeve across his eyes and looked again. Yes, it was Emily. She came up to him, with no sign of embarrassment.

"Well, Hiram, I thought you weren't coming. I've been here some time and will soon be starting back," she announced brightly. The other man passed on to take his place among the voters, but Hiram stood still in his tracks.

"Emily," he inquired solemnly, "how ever did you get out of that pantry?"

Emily looked startled. "The pantry!" she echoed. "Why, Hiram, what do you mean?"

He stared at her for a moment in silence.



"Somebody——" he began, then stopped. "Well, I locked the pantry," he finished, rather lamely.

His wife looked at him curiously. "I guess you've been dreaming, Hiram," she replied at last. "I locked the pantry door myself and laid the key on the kitchen table. But you don't look just right. Perhaps we ought to get home rather early. And with that she passed on.

Hiram pulled the key from his trousers pocket and stared at it.

"Dreaming, was I" he muttered. "Well, I guess not! But she's right about getting home early. I'll do that!"

As luck would have it the two teams in which the couple had gone to town pulled up at the Barton home at precisely the same time, and without stopping for further chat, with their neighbors, Hiram and his wife alighted and entered the house together.

Hiram hung up his coat and then sat down mechanically in the chair his wife pushed toward him.

Emily stepped behind his chair, then something slipped down over his shoulder, and looking down he found a pair of very handsome slippers upon his lap.

"What in the world,—" he began, when his wife's merry laugh interrupted him. "Happy birthday, Hiram!" she exclaimed, gaily.

A sudden light broke over Hiram's mind. "My birthday!" he ejaculated. "Why, of course it is! And I'd forgotten all about it. Emily," he queried suddenly, "is that why you went to town?"

"Of course it was," laughed Emily, with her hand on the kitchen door. "Just you wait and see—"

Her voice stopped suddenly as she entered the kitchen, and with a sudden recollection, Hiram arose and followed her. The key to the pantry was still in his pocket. He drew it out and then halted, facing his wife, and the two stood staring at each other.

Strange sounds were issuing from behind the closed pantry door—a long indrawn wheeze, like the breath of an asthmatic hog, and ending in a decided snore. The sound was repeated at regular intervals.

Hiram strode across the room, unlocked the pantry door and jerked it open, then stood gazing blankly at the scene within.

The room presented a littered and mussy appearance, in direct contrast to its usual tidy order, while seated with his back against the wall, with head thrown back and mouth wide open, was the much-tattered and badly soiled figure of a man.

There were crumbs in his grizzled beard; his pockets bulged, and even in sleep his features wore a blissful and well-fed grin.

Hiram's disgust was all contained in one sentence: "The same old tramp."

He stepped wrathfully forward, seized the intruder by his jacket collar and dragged him to his knees.

"Open the door, Emily," he ordered. His startled wife obeyed, and with a series of jerks and pushes the tramp was assisted from the house.

BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

His Face Was Covered With Pimples.

Pimples are not a serious trouble, but they are very unsightly.

Pimples are caused wholly by bad blood, and to get rid of them it is necessary to purify the blood of all its impurities.

Burdock Blood Bitters has made many remarkable cures; the pimples have all disappeared, and a bright, clean, complexion left behind.

Mr. Lennox D. Cooke, Indian Path, N.S., writes: "I am writing you a few lines to tell you what Burdock Blood Bitters has done for me. Last winter my face was covered with pimples. I tried different kinds of medicine, and all seemed to fail. I was one day to a friend's house, and there they advised me to use B.B.B., so I purchased two bottles, and before I had them taken I found I was getting better. I got two more, and when they were finished I was completely cured. I find it is a great blood purifier, and I recommend it to all."

Burdock Blood Bitters has been on the market for the past forty years, and is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

After some brief but busy moments, Hiram returned to find his wife standing in the pantry door, holding in her hands a plate on which were the remains of a large and beautifully frosted cake, whose crumbled fragments still emitted a most appetizing odor.

"I'm very sorry, Hiram," she remarked demurely. "It was your birthday cake."

Hiram's face was already flushed from his exertions, yet it reddened perceptibly as his sheepish eyes met the quiet ones of his wife.

"Emily," he returned contritely. "I guess I've been pretty much of a fool."

And Emily's reply was a wise little smile.

When Re-Papering and Painting.

"It is not a light matter, the way we spend our time, our strength, our intelligence. The higher duties of womanhood, the higher evolution of humanity through her, of society through the household, demand a more healthful condition of household economics than this present shows. Our households are surcharged with waste matter, and our lives are spent in its arrangement and removal. Soul, mind and body are limited by the dust pan," says Helen Campbell.

At the time of house cleaning the wise woman weeds out the useless and worse than useless truck that litters the house, holds dust and causes needless work of dusting and arranging. It takes courage often to do away with things which are dear because of the giver, but one's time, strength and health are of much more moment than an assemblage of worthless bric-a-brac.

Bedrooms should be especially free from dust catching draperies and useless articles. When draperies are used they should be light and washable, and often washed.

For the housekeeper who has to economize (as a large majority of our housekeepers do, which makes life interesting) and who finds it necessary to repaper because the walls are faded, kalsomine may be used with good effect. It is very satisfactory even over cheap paper if it is firmly attached to the wall. If there are any loose portions they should be carefully pasted and dried before putting on the kalsomine. Put the kalsomine on the ceiling first, of course, to save spattering the side walls. A long stroke down the length of the paper makes a smoother finish than if put on with a side stroke. This is a saving of time as well as money and one need not tear up the house, as a careful worker will do no spattering. Cover a green paper with a green kalsomine and the walls will look fresh and new. Usually one coat is sufficient to cover; but two may make a better finish.

In this day of rugs, which are easily removed, the floors need to be kept in good condition. An economical way when using a large rug in the centre of the floor is to grain the floor a few feet around the edge, the only part which shows. This, if well done, will look nearly as well as a hard wood floor. Varnish the linoleum covered floor spring and fall to keep the colors bright and insure its wearing longer.

An easy way to kep the kitchen cupboards looking well is to paint the shelves spring and fall with a good white paint. If one cares to incur the expense, an enamel makes a fine hard finish which is easily wiped off. The shelves are then ready for the dishes without any paper or other covering. When the shelves get dusty, they are easily wiped off and the cupboard is always clear. A good method to use is to clean one shelf at a time when washing dishes, this will not be much of a burden and in this way they are always dustless and fresh looking.

In rooms that have only north light a paper with a good deal of yellow will add the desired sunlight color to the room. A paper should be tried in the room in which it is to be used, in both daylight and with artificial light. Some colors so absorb the light that a cheerful room at night is impossible. An oilcloth wall covering is good in the bathroom or the kitchen where a more expensive covering cannot be afforded. This can be wiped clean as easily as a dish.

To remove paint spatters which have dried on windows, scrape with a penny.

The ancient habit of tearing up the entire house so that there was no place to sit or have one's meals in comfort has happily passed away. Unless extensive repairing is to be done there is no need to make the family uncomfortable each cleaning season.

BRING BACK THE ROSES TO FADED CHEEKS

Anaemia and Chlorosis are caused by weak blood. Your doctor will tell you that nothing will bring back the rosy hues of health as quickly as

Wilson's INVALIDS' PORT

à la Quina du Pérou.

Because it is a combination of full-ripe Douro Grape Juice, retaining all the mineral salts, grape-sugar and fruit acids—with Cinchona Bark, the most powerful nerve tonic. A few weeks' use will revive lost ambition, awaken the lagging appetite and put new life into the nerve centres.

"Where Times are Never Very Bad."

All things seem to work together for the good of the Maritime Provinces. Each year from some unexpected source comes the saving factor in the situation. To go back only as far as last year, our apple growers marketed their crop in the Old Country to remarkable advantage in spite of all the adverse factors in the situation, and this year Ontario is buying hay, potatoes and apples from us. We have a bumper crop of hay in the Maritime Provinces this year and the prospects now are that it will command a good price. Our potato crop has suffered to a considerable extent from rot, but with the high prices that promise to prevail the farmers stand to make a good thing out of what they have. The most itneresting point of all however, is the enquiry in the fruit belt of Ontario for our apples. We have on the whole a good sized crop, though in some parts the quality is not as good as we have had in some past years. However, our shippers are receiving orders from this unusual source and it will help to counteract the influence of any difficulties that may arise in connection with effecting shipments to the Old Country. Plainly it is going to be a good year for our farmers in spite of any doubt that may have arisen earlier in the season about the possibility of successfully marketing the increased output that was promised. It seems as if it is quite impossible (doesn't it) for times in the Maritime Provinces ever to be very bad.—Maritime Merchant.

The Woman's Thanks

There is so much strong men are thankful for—
A nation's progress or a slow strife's end;
And though I join my praise with theirs today
Grave things are these I scarce can comprehend
So vast are they;
And so apart, dear God, I pray thee take
My thanks for these thy little blessings' sake.

The little, common joys of every day,
My garden blowing in an April wind,
A linnet's greeting and the morning fall
Of happy sunshine through the open blind,
The poplars tall
That guard my threshhold, and the peace that falls
Like Sabbath stillness from my humble walls.

The little, simple joys that we forget
Until we lose them; for the lamp that lights
The pages of the books I love the best,
The hearth's red welcoming on winter nights,
The kindly jest
That moves within its circle, and the near
Companionship of those the heart holds dear.

The dear, accustomed joys we lightly take
Too much for granted sometimes, as a child
His father's gifts; and, so remembering, ...
For these my thanks, for these my treasures piled,
Each simple thing
Those wiser may forget, dear Father, take
My thanks for these thy little blessings' sake.
—Theodosia Garrison, in "Harper's Bazar."

School Lunches

I am not so far removed from the time that I carried a lunch box as not to have some idea about the matter, also, I have had ample opportunity to note the contents of the average child's dinnerpail.

Greater simplicity seems to me to be the desideratum—less cake and pie, and more of the substantials. A bit of meat or cheese or a hard-cooked egg is an addition to good bread and butter much coveted by most youngsters. And in the country, where fresh eggs can be had nearly the year around, they should hold a large place in the average child's lunch.

Eggs have been analyzed and found to contain a chemical known as lecithin—one egg having as much as 16 grains of this substance, hence just one egg eaten a day will give tone, vitality and activity to the brain and nerves. This will make man "50 per cent. efficient." Never be guilty of putting a soft-cooked egg into a lunch-pail. It is unhandy and untidy to eat. Enjoy these at the table, in the home. I believe many pupils do not do satisfactory school work because mentally starved. They eat enough, of course, but their diet is hit-and-miss, and their food is often lacking in the very things most needed to vitalize the mental forces.

Anyone that carries a lunch eats under great disadvantages. The food is cold. This of itself is a hindrance to digestion and takes much of the body heat. The eating is accomplished as speedily as possible, hence the mastication is neglected and this means more work for the stomach and affects the nerves.

Let those that put up the lunch see that it is given a neat and dainty appearance. Children appreciate it. Put a napkin in his pail. Occasionally let him find a handful of shelled nuts (walnuts, almonds, chestnuts) or fat raisins or currants, or a few bits of rock candy, taffy or a caramel stowed away in the corner of the box. It will prove a delightful "find" to the child. Encourage children to eat the dainty after the other food.

The old-fashioned nutcake or doughnut that used to be common in old families is an excellent cake for the lunch-box.

Then teach the children not to bolt their food. Reward them in some way, that will readily suggest itself to the judicious parent, for taking a long time to eat.—F. M. C.

Brighten the Kitchen

One wonders at the housekeeper who choose for their kitchen walls and woodwork a dingy grey or brown or some other dark, dull color that will not show the dirt. Are they better housekeepers because the dirt, which is surely there, does not show Would these same women wear black dresses and aprons when doing the cooking and feel that they were clean because they did not look soiled?

The kitchen should be the cleanest, sunniest and most cheerful room in the house. It is here the housekeeper spends most of her time, and it is here the food is prepared and often served.

It is not always possible to have the kitchen located so as to get the best light, but a dark room may be much improved by using the proper colors. In a Minnesota town the school kitchen had windows on the east sied only. Half of them were on a court and the others against a hill; but the use of a deep cream tint on the ceiling, a buff ond the walls, and woodwork of southern pine finished in the natural color and varnished, the effect of sunshine was given even on the dull, short days of the northern winter.

If there is much sunshine in the kitchen white or blue may be used; but on the north side of the house use buff or warm, yellowish tan. The increased cheerfulness and better spirits of the housekeeper will mean much to the entire family, and her work will not be increased by the new color scheme because a sunny, pleasant workshop lightens every task.—Mary L. Oberlin, Colorado Agricultural College, Fort Collins, Colorado.

Care of Sewing Machines

The care of a sewing machine is given far too little attention by the majority of women, and it seems a singular thing, too, for, like every thing else, it responds generously to the right treatment. Where it is run quite constantly it should be oiled every night, but where it is used, say, a little every day or so, once a week is enough to clean and oil it.

To overhaul the machine thoroughly. Set it in a good light, loosen the strap and loosen the plate. Remove the shuttle if it is a double thread machine and get every particle of dust and dirt out. A steel stiletto with a soft cloth wound around the point will help a good deal. A small size camel's hair paint brush is a valuable aid in this cleaning process. Clean the wheel wheel and all the lower part. Have two machine oil cans always, keeping one filled with good kerosene and the other with a standard machine oil. It is not economy to buy a cheap grade.

Use kerosene everywhere that oil is ordinarily put, then fasten the plate and put the strap in place and run the machine hard for a few minutes. Let it stand over night, and in the morning wipe every particle of kerosene off and oil thoroughly. By this is not meant deluging the parts, but using perhaps a couple of drops in each place and being sure that none is forgotten. Run the machine a little and let stand over night and in the morning run it soem more and wipe carefully. Most people use oil too freely, when they use it at all, with the result that it keeps coming out and getting on materials.

If there seems to be much more difficulty in regulating the tension, it will be better to have some one from the shop come out and fix it. If the shuttle tension is once well regulated it is never necessary to alter it, the regulating being done with the outside one.

Health is Wealth.

Issued by the Department of the Public Health, Nova Scotia

An eminent English statistician, Dr. Parr, from a study of the experience of the mutual insurance organizations in London, estimated that for every death recorded there is an amount of sickness which might be stated as sufficient to confine a person to bed for two years. An application of this estimate to Nova Scotia indicates that during the last statistical year the amount of sickness in the province would account for nearly 5,500,000 days of confinement to bed. Thus the enormous cost of sickness can be at once appreciated.

Considerably more than half the deaths occurred during the productive years of life, so that to the cost for medical attendance, nursing and medicines, we must add the loss of income entailed through approximately 3,000,000 days of illness.

It is generally conceded that there is no other factor so potent in the production of poverty, degeneracy and crime, as ill health.

It is well recognized that nothing is so essential to efficiency, success and the thorough enjoyment of life as good health.

As the struggle for place and even for existence becomes more intense, in the face of competition which is constantly growing keener, the need for sound health becomes steadily greater. No community need hope to make substantial advance unless it attends well to the measures necessary to maintain its people in a healthy, virile state. Any insanitary condition may be a menace to the health of the whole

GIRLS—Aren't you just longing to own this beautiful big doll's house, with dolly and all her handsome doll toys? Well if you are quick you can get them all without a cent of cost.

This is really the biggest and handsomest doll's house ever offered. It is so large and roomy that it will hold a whole family of dolls and when you put a candle inside at night and light it up, it looks just like a fairy palace. You will surely be delighted with it. We give you with it this big handsome Paris Beauty doll, dressed complete in the very newest fashion from hat to shoes. She has lovely curly hair, beautiful pearly teeth, sleeping eyes, and is fully jointed so that you can move her in any direction. Next we give you this lovely French Bisque Baby Doll and with her you get the cutest doll bed ever seen, all complete with mattress, spread and canopy, and as well, this handsome all metal baby doll carriage—handsome as can be with its bright parasol and silver bright metal finish. It's a dandy carriage for baby.

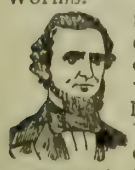
Girls be prompt and write today and besides all these beautiful and costly presents we will give you a lovely gold finished ring set with three handsome brilliants. Simply send your name and address today and you will receive by return of mail 30 lovely Regal Beauty Pin Sets, each set consisting of two handsomely engraved gold finished beauty pins on a nice card. We ask you to sell these among your friends at only 10c per set and you can easily do so because they sell at sight. Every lady wants two or three sets. Its no trouble at all. Return our $3.00 when you have sold the goods and we promptly send you the complete outfit—doll, doll house, baby doll, doll bed, carriage and ring just as represented.

Remember girls, no money in advance. We trust you. This is the chance of a life time. We arrange to stand payment of delivery charges. Write today to

THE REGAL MANUFACTURING CO. Dept. B. 41 TORONTO, ONT.

Worms Sap Children's Health

Mothers often wonder why their children are not rugged and hardy. In a vast number of cases the trouble is—Worms.



Trade Mark

Signs of worms are: Indigestion, variable appetite, craving for sweets, nausea, vomiting, swollen upper lip, sour stomach, offensive breath, hard and full belly, eyes heavy and dull, twitching eyelids, itching of the nose, itching of the rectum, short dry cough, grinding of the teeth, little red points sticking out on tongue, starting during sleep, slow fever.

Dr. True's Elixir, the 60 years time-tired Family Laxative and Worm Expeller, will expel the worms and restore the vim and vigor to your child. Good for adults also. Discovered over 60 years ago. 35c, 50c and $1.00 at all dealers'. Advice free. Special treatment for tapeworms. Send for book.

Knowlton, Que. Dr. True

neighborhood, and should not be tolerated. Self interest demands that we should require of our neighbors and of everyone in our community strict attention to sanitation; that we should require clean air, clean water, clean food, clean homes and clean surroundings; that we should regulate our habits in accordance with well established rules; and that we should secure proper protection against the spread of communicable disease.

Children and Dicipline.

The following hints to teachers which appeared in the "Educational Review will be equally useful for parents.

Prevention of wrong-doing is better than punishment of the wrongdoer.

Exercise great care in taking a stand that you may have no occasion to retreat.

Fault finding is not calculated to cure a fault.

Distrust in the parent breeds deceit in the child.

A child properly employed gives no trouble.

Be firm.
Be kind. —
Be patient.
Be self-contained.

Be as perfect as you ask your children to be.

And above all, make no threats.

Preparing Next Years' Exhibits

Now is the time to begin preparing exhibits for next year's fair.

By carefully studying the exhibits that took first prize you can find a means to winning next year. Do not stop with merely a cursory glance (too often a cursery glance) at the winning booth. Likely the man invested more capital than you care to spend on an exhibit, but capital never equaled brains yet. Study out the reasons why you like the exhibit, and what attracts you to it.

"IN TIMES OF WAR PREPARE FOR PEACE"

Plant fruit trees now, so as to reap the harvest when peace is restored. We can supply choice Apple trees, Ornamental trees and Shrubs, Raspberry, Gooseberry, Currant and Strawberry plants of our own growing at lowest prices. Bees and Beekeepers Supplies. Satisfaction guaranteed. Write for prices.

E. L. COLPITTS,
PETITCODIAC, - N. B.

After you have discovered, in so far as possible, wherein lies his success, dont' go home and forget about it. Go over to the Farm Machinery tent and get one of those little memorandum books they give away, and write down what you think. Use the whole fair in getting suggestions what to do, and what is more important, what not to do.

Gather together carefully the things you can use again next year, listing them carefully in your "Exhibit Book." During the winter and early next season when an idea comes to you write it down. Then use your "Exhibit Book" as the basis for your arrangement of your exhibit next year.

Home Remedies.

Hot water and salt are very effective home remedies. A sudden sore throat will disappear rapidly if hot water cloths are wrapped around the neck, and a swallow of hot water, held in the mouth for a few seconds, will often relieve a sick headache. A nervous headache is relieved by applying hot water cloths to the soles of the feet and back of the neck. The patient should be kept quiet and allowed to sleep, if possible.

When dry heat and the hot water bottle fail to remove rheumatic twinges, wring flannel out of hot salt water and apply to the affected parts. If the ear is filled with warm water and then after allowing the water to run out, plugged with a little cotton that has been dipped in olive oil or glycerine, it will usually cure the most stubborn case.

The earache and toothache being the result of a cold, keep the patient in a comfortable position near a fire and allow him to sleep. In using hot applications, always remember to change them frequently, keeping them hot, for if allowed to become cold, they will do more harm than good.

Warm salt water held in the mouth will stop the flow of blood after a tooth has been drawn, and will often cure toothache. It is a good gargle for sore throat or hoarseness, and if drawn up into the nasal cavity will prevent the development of catarrh.

Tepid water and salt make a good emitic for one who has taken poison. Small doses of salt taken at inervals will relieve hemorrhage, and nose bleed may often be stopped by bathing the face and neck in cold salt water.

Always salt nuts well before giving them to the children to eat, as this makes them more palatable and digestible and prevents colic that it often caused by eating nuts. A half teaspoonful of salt wil relieve this colic, causing the nuts to assimilate with the other food and digest.

Bathing the feet in warm salt water and then rubbing them with dry salt will avert a cold after getting one's feet wet. A salt bath is a good and bracing tonic.

The Japanese use salt as a dentifrice and have very firm, white teeth. It hardens the gums and keeps them in a healthy condition. There are really no more simple or effective remedies than salt and water for many of the little ills that flesh is heir to.

Our Mentor.

Not weighty eruditions guide
  Our groping feet
Most perfectly where pathways hide
  For travel meet:
One mentor marvellously have we
  Through thickets wild:
One girt with God's authority:
  A little child.

—Louis M. Waterman, in Sunday school Times.

Beautiful Walls For Your Home Sanitary, Fire-Proof, Inexpensive
Make your home more attractive, and protect it from fire with these beautiful, sanitary
"Metallic" Ceilings and Walls
They will out-last the building and are very inexpensive. They can be brightened from year to year with a little paint at a trifling cost. Made in innumerable beautiful designs suitable to all styles of rooms. Can be erected over old plaster as well as in new buildings. Write for catalogue.
We manufacture a complete line of Sheet Metal Building Materials.

MANUFACTURERS - - King and Dufferin Streets - - TORONTO

Gingerbread.—Home made gingerbread is always kept in some houses, especially where there are children. It is most nourishing and excellent for growing bodies. The ingredients are plain but good, consisting of mixed flour and fine oatmeal, with ginger to make it hot and strong, milk and eggs wherewith to mix the mass, sugar and treacle to sweeten it. It becomes a stimulant of a fine kind, is a very good laxative, on account of the treacle in it, a carminative, because this is the action of the ginger, a stomachic, a preventer of colds and a warder-off of chills. Butter is in it, or, in the plain sorts, lard, and so the confection becomes very good. In Engalnd, gingerbread, almost wholly compounded of oat-flour, lard, ginger, treacle, was the universal cake eaten on the fifth of November, which day was kept as a feast by Act of Parliament after the failure of the Gunpowder Plot. And to this day, though that feast is only honored by children, the parkin, as this gingerbread is called, appears in the shops. Parkin it was called, on account of the fireworks, mimic parks of artillery.—Food and Cookery.

Jacoba Johanna, a Holstein cow, bred by Lea & Clark, was again Sweepstakes female at Calgary.

Home-Made Insect Powder for the PoultryKeeper.

There are scores of so-called "poultry lice remedies" on the market. They are not only expensive, but no more effective than some of our simple home-made remedies.

A good home-made insect powder can be made by thoroughly mixing one-fourth pint cresol and three-fourths of a pint of gasoline. Add to this mixture gradually with stirring just enough plaster of paris to take up the liquid. For the above amount it will take about two and a half pounds of plaster of paris. Spread out thin on a paper until dry. Screen carefully and it is ready for use.

If strong crude carbolic acid is available it can be used instead of cresol. This powder can be boxed, put in a dry place and kept for a long period of time. To apply the powder, dust the birds thoroughly around the vent and in the fluff under the wings. The application should be followed by a second in four to six days to kill the lice or mites from the unhatched eggs or "nits" present at the first treatment.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without [illegible] from anyone. My treatment cannot [illegible] sufferings; what we women know from experience, we know better than [illegible] and thousands have proved there is hope [illegible] for the hopeless in my method [illegible]. If you suffer from pain in the head, back, [illegible] bowels, feeling of weight and dragging and [illegible] sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment [illegible] free and postpaid, to prove to yourself that these ailments can be easily and surely [illegible] your own home, without the expense of hospital treatment, or the dangers of an [illegible]. Women everywhere are escaping the surgeon's knife by [illegible] my simple home treatment, and when you are cured, my sister, I shall only ask you to pass [illegible] to some other sufferer. My home treatment is for all—young or old. To Mothers of Daughters. I will explain a simple home treatment which speedily and [illegible] (chlorosis), irregularities, headaches, and insomnia in young women, and restores [illegible] to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days' trial, and if you continue, it costs only a few cents a week to do so, and it [illegible] Is health worth asking for? Then accept my generous offer, write for the free treatment [illegible] to your needs, and I will send it in plain wrapper by return mail. To save time, you can write me this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS BOX 309 WINDSOR, ONT.

A Serious Question.

How Are Your Children's Adenoid's and Tonsils?

(Dr. Charles F. Campbell.)

Note.—This is an effort to instruct parents concerning the necessity of having their children's diseased adenoids and tonsils removed. This warning is necessary with probably seventy-five per cent of parents. The dangers of adenoids and enlarged tonsils are so great and lasting, they do so ruin a child's entire life, that a strong warning is not only forgivable, but greatly to be desired. Every mother who reads this will "sit up and think" and she will know how to detect these troubles; she will know the dangers, and she will act. And this "acting" is what is desired for the betterment of the coming generations.—Editor.

"The child is a perfect fool!" How many times have you heard this said of some unfortunate child, you mothers? Perhaps you have said it yourself. Perhaps you have overheard it said of your own child!

You have seen thin, pale, unfortunate youngsters, who went about as stupid as a log of wood, mouth open, eyes protruding and weak, teeth sticking out, chin retreating, vacant stare, talking thickly or lisping in rather guttural tones. You have seen such children who were bashful and shy, who ran away at the sight of strangers, who were timid, who did not seem to hear you when you spoke, who could not seem to follow what you meant when you did talk to them.

It is of such children that the expression, terrible in every aspect, is made "The child is a perfect fool!"

But, ninety-nine times out of a hundred, the mother of that child has been, or is, a perfect fool!

Not that the poor child inherited its stupidity and pitifully idiotic appearance. No, indeed, the child was quite normal, once. It was unfortunate enough to have a mother who was a "perfect fool." It seems about the harshest thing anyone could say of a loving mother, whose secret heart is breaking because her dear child is turning out so unlovely, so pitifully ugly and stupid, but one cannot say harsh things enough about such a mother, because it is all her fault—and, of course, her husband's fault, too.

Diseased adenoids and tonsils can make the child a fool, if he was not born defective.

Now, a child cannot go ahead and have his tonsils cut and his adenoids removed. What does he know of such things?

But the mother could have done so, should have done so.

Every parent who neglects to do this is criminally negligent!

"But how did I know my child had adenoids and enlarged tonsils|" is what many a mother has asked me, when I have spoken to her rather plainly concerning her neglect.

"Common intelligence should have told you something was wrong. You should have found out what it was. You should have thought of these things. You can read, hear, understand, and the world is full of information about such things today. Tonsils and adenoids are not new to you. You know what they are, you have heard what they mean. You merely put it off and off, until now your child will be a half dozen years getting back to normal again, and probably he will never be quite the same that he would have been if you had had him attended to when he was a little tot!"

That is the sort of plain talk I give, I do it purposely. I hope it will prevent further mistakes of that sort, and that it will enable mothers to teach their children what to do when they become parents.

This is not a scare. It is a plain, unvarnished statement **of fact.**

Diseased adenoids may not kill outright, nor enlarged tonsils, but almost better kill a child than bring him up to be stupid—literally a fool!

The enlarged tonsils mean that he will be susceptible to diphtheria, tonsilitis, and other throat troubles, a hundred times sooner than a normal child, and his chances of recovery when he has diphtheria and enlarged tonsils are not very good.

The swollen adenoids close the nasal breathing passage. The child cannot breathe through his nose, but must breathe through his mouth. He keeps his mouth open always. This impairs his hearing, it spoils his looks, it makes his face grow wrongly, it causes all sorts of germs (which should be stopped inside the nose by the fine hairs and the ever-wet mucous membrane) to go down the throat, get into the lunngs and into the blood, and, also the child is in great danger of tubercular and other similar troubles.

No, I cannot say that diseased adenoids and enlarged tonsils are fatal, but they are the biggest help to fatal diseases of anything I know about.

Even if there is no indication that your child has swollen adenoids, do not take the least chance; have your family physician examine the youngster. He can tell at a glance if the tonsils are too large, and he can easily tell if there are symptoms of diseased adenoids.

Fortunately, the symptoms of both are so plain that parents of average intelligence should be able to know when this trouble overtakes their children I believe at least sixty out of every hundred have diseased adenoids and enlarged tonsils before they are eight years old.

In such cases there is only one thing to do—have the tonsils and adenoids removed.

Do not shudder at the word "operation." It is a minor operation. Today a physician slips a small instrument into the child's mouth—"snip," and the tonsils are gone. Many young people have come to me and had them removed without an anaesthetic, although I do not approve of this, unless the heart action is weak. But do not regard it with the least horror. There is nothing more fatal about it than having a splinter removed. A bit of anaesthetic, a couple of minutes' work, a day when the child feels uncomfortable, and it is all over!

No one can then say of your child, "He is a perfect fool!"

The child will begin to breathe through his nose, he will learn to close his mouth and open his eyes, he will regain his impaired hearing, have a better appetite, and soon be back to normal condition.

That is why I insist that it is nothing short of criminal negligence to allow a child to go with diseased adenoids or with enlarged tonsils. No parent can estimate the danger of doing this. And no parent can overestimate the life-long advantage it will be to the child who is properly prepared physically to fight life's battles—given a clear head, a perfect breathing apparatus, and made as immune as possible from the dangers of contagion.

Remember, there is no half way method. Diseased adenoids and enlarged tonsils cannot be "cured." The only means is by the knife, but it is so simple, so easy, so harmless, that only a foolish (to put it very mildly) parent will neglect his duty.

Intelligent parents today do not want to take a dangerous chance with their children. If there is anything at all that can be done to assure them better health, stronger bodies, and less hours of pain, while going their destined journey through life, the modern parent will see that it is not left undone.

The first thing, then, is to know how to detect enlarged tonsils and diseased adenoids. If your child takes cold very easily, if every cold develops into a sore throat, if earache accompanies such colds, you may be pretty certain that his tonsils are enlarged. Do not guess at it. If any of these symptoms show up, have the child examined by a physician at once. Do not think that you can take a child into a strong light, insert a spoon in his mouth, and look down his throat and see the enlarged tonsils. You may see some inflamed places and you may look directly at the tonsils, you may even be clever enough to know you are looking at the tonsils, but how do you

It's good for little girls, too

Everybody—young and old—loves the rich, delicious flavor of

EDWARDSBURG "Crown Brand" CORN SYRUP

It is a daily treat—the perfect sweet. Just what the children should have on Bread—costs far less than butter or preserves. Delicious with Hot Biscuits, and Batter Cakes. Gives a new delight to Baked Apples, Blanc-Mange and Puddings. Makes the best Candy you ever tasted. 3

"LILY WHITE" is a pure white Corn Syrup, not as pronounced in flavor as "Crown Brand". *Your Grocer has both Brands, in 2, 5, 10 and 20 pound tins—or can easily get them for you.*

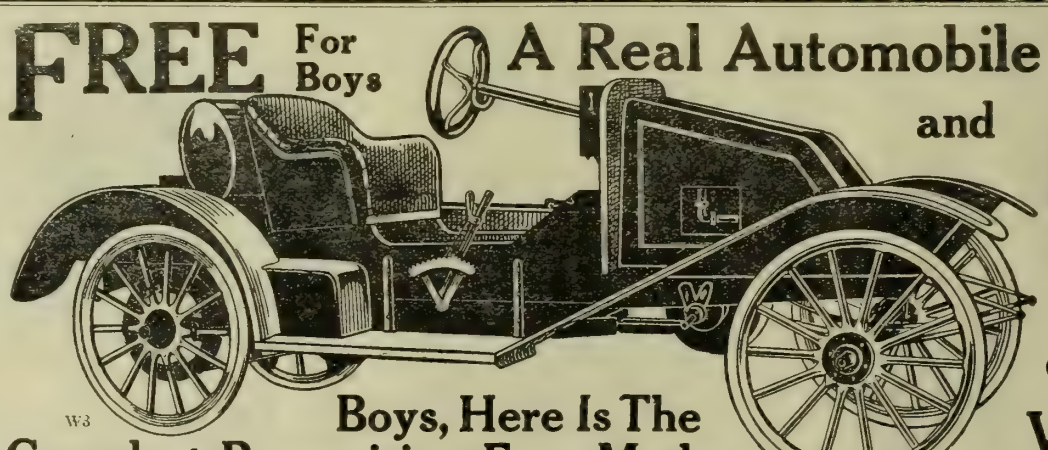
FREE For Boys A Real Automobile and A Guaranteed Watch



W3

Boys, Here Is The Grandest Proposition Ever Made

YOU can have this real 5 horse-power automobile with an air cooled 4 cycle gasoline engine that can't be beat. This is the Canadian boy's cycle car and it's yours free, besides a crackerjack guaranteed watch in the bargain.

If you have ever wanted an automobile, now is your chance to get one for nothing. This car is just big enough for one person. It is built exactly like the big autos on a small scale. It has artillery wheels and solid rubber tires, steering gear and wheel, two kinds of brakes, starting crank, upholstered seat, tool box, tools, cone clutch. It will run 30 miles on one gallon of gasoline. This is the real thing for the real live boy, and besides the great auto we are going to give you a dandy guaranteed watch that any boy would be proud to own.

If you think you are a live boy and not afraid to run a real automobile, just send us your name and address. We want you to help us advertise and increase the demand for our new double-strength spearmint chewing gum, put up in big packages—and sells at 10c. a package. Our gum sells like wildfire because every purchaser gets a valuable certificate entitling the owner to receive a copy of the great Patriotic Picture, "The Story of a Brave Canadian Father," worth $2.50. Each picture is reproduced in its original magnificent colors and is 16x20 in size. It is the most stirring and Patriotic Picture painted on the war. We will send you post-paid and trust you with only **35 PACKAGES TO DISTRIBUTE AT 10c. A PACKAGE.** As soon as you have sold them return us $3.50. **YOU WILL RECEIVE IMMEDIATELY AS A REWARD** for your work the magnificent watch, and the automobile is yours too without selling another cent's worth of goods, just by sending us the names and addresses of eight boys who would like to have our fine premiums too and who will be our agents. **Send your name to-day to**

THIS IS FOR REAL LIVE BOYS ONLY

Suffered Awfully

FROM

BILIOUS HEADACHES.

When the liver becomes sluggish and inactive the bowels become constipated, the tongue becomes coated, the stomach foul and bilious headaches are the upshot.

Milburn's Laxa-Liver Pills will stimulate the sluggish liver, clean the foul-coated tongue, do away with the stomach gases and banish the disagreeable bilious headaches.

Mrs. J. C. Kidd, Sperling, B.C., writes: "I have used Milburn's Laxa-Liver Pills for bilious headaches. I suffered awfully until I started to take them. They were the only thing that ever did me any good. I never have any bilious headache any more."

Milburn's Laxa-Liver Pills are 25c per vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

know whether they are enlarged or normal?

Back where the palate hangs down are two thin upright folds of the lining membrane, arching down each side of the throat. These are the "pillars" which cover the swallowing muscles, and the little pink almond-shaped soft things bulging out between them are the tonsils. But you can remove the spoon and let your doctor decvide about the necessity of cutting them.

It is much easier to detect diseased adenoids. Look at your child's mouth when he is asleep or awake. Does he sleep with his mouth open? Does he stare off in his childish day dreams with his mouth open? If so—"adenoids!" Look at the child's nose. If it runs, if it is sore, if he snuffles a great deal, and if he has fever sores, he doubtless has swollen adenoids. If the youngster seems dull, if he stands and stares at you without apaprently understanding all you say, and if he breathes hard through his mouth, and puts his hands up to the side of his head frequently as though he felt a dull pain, you may be pretty sure he has sick adenoids. Don't guess, take him to the doctor!

If your child is normal, all his first teeth should be in when he is two years old. Begin to look for diseased adenoids and enlarged tonsils any time after that, and remember that "eternal vigilance is the price of safety." Then, if you or your physicians find them, have the operation performed. Better have both done at once; it will save time and trouble and worry, and ninety-nine times out of a hundred, a second operation.

Adenoids grow from the back part of the throat, where the throat and nose join; they are red, and shaped like little heads of cauliflower. Hanging from the back part of the nose, they stop it up and force dangerous mouth-breathing. When the child breathes through the mouth he takes in more dust and germs than it is possible to do through the nose. We have hairs and peculiar winding passages in our noses, to prevent this very thing.

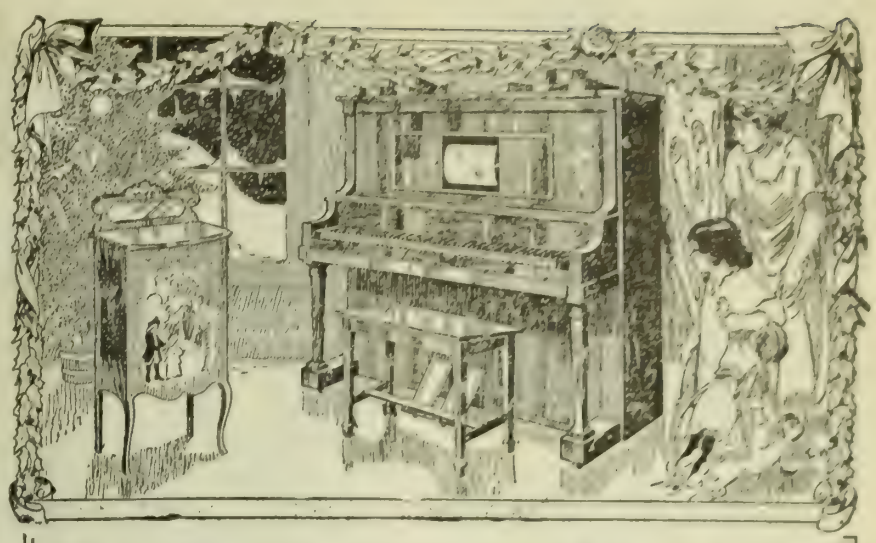
Even if your child does not seem to have diseased adenoids, if he breathes through his nose apparently quite normal, he may have the start of them. If he is rather dull in school, if he has frequent earaches, if his upper lip seems very short, it generally means swollen adenoids, especially if he draws his upper lip frequently, showing his upper teeth.

To be safe, have the child examined anyway. It is always best. Children with swollen adenoids and enlarged tonsils are always more susceptible to disease than normal children. If there is an epidemic of scarlet fever, or measles, or anything like that around, they are the ones who get it before normal children do. This is quite natural, since their little mouths are open to catch all those germs flying about the community.

Let me emphasize this again: Do not be alarmed at the thought of having adenoids or tonsils removed. It is a minor operation, not at all dangerous, and the recovery is rapid. The youngsters have one bad day of it afterward, and then they are playing about as happy as ever, with only a touch of what they may call "sore throat," but which heals rapidly. They really suffer far more with diseased adenoids and enlarged tonsils than they do from the operation while they are recovering, only they are used to the former, while the healing sensation is new.

Diseased adenoids and enlarged tonsils frequently have a tendency to bring on rheumatism and heart troubles. They hold poisonous germs, which may be carried by the blood to the heart, or to the joints, and thus cause the rheumatic pains. They prevent the good, sturdy growth of the child, give him a weak little face with a weak jaw, and, taken altogether, they are about the most undesirable things a child can have.

Fortunately, if taken in time, there will no harm result.



The Best Christmas Gift of All

Christmas without music would be like June without roses. And there is no home music like that of the piano, which has been brought within the reach of even the little ones by the

NEW SCALE WILLIAMS

Laundry Notes

Stains which bother in the laundry are of three kinds, i.e., those caused by vegetable growth, those from actual chemical compounds, and those caused by a deposit of small, solid particles.

Mildew is perhaps the stain which puzzles the housekeeper the most. It is the most common type caused by vegetable growth. When this stain is examined under the microscope one can see a network of tiny tendrils which cannot be seen without the aid of the microscope. On the ends of some of these tendrils can be seen small cup-shaped organs which hold small seeds or spores, which scatter over the cloth and start new plants. This is the way the mildew stains spread all through a garment. These little tendrils will, if given time, find their way through many layers of the material.

Oxygen will destroy the mildew plant, but it will thrive in a damp, warm place. To remove mildew from a garment, first give it a thorough airing and then place in boiling water; the character of the stain is changed and it is now a chemical compound, for the mold has produced a dye. A bleaching process has to be resorted to now to remove the stain. Soak the garment in equal quantities of hot water and javelle water until the stain disappears; thoroughly rinse in three waters; then rinse in water to which a little ammonia has been added.

In most all processes of bleaching, an acid is formed which will weaken the fibres of the cloth, and, if very strong, will destroy them unless quickly neutralized by an alkali. Ammonia or washing soda solution are the best to use for this purpose.

Stop that Torment of Mind and Body!

Write Me!!

You discouraged women, sufferers of physical torture and distress of mind, you ladies staggering under the burden of never-ending doctors' bills and all to no purpose—write me!

I have passed through and conquered all that you are now enduring. From my own experience I can sympathize with you and realize your state as no doctor ever can. Because I have benefited and profited by the use of that wonderful "Orange Lily" treatment and have seen it perform the seemingly impossible for other sufferers, I want every ailing woman to get a free trial of this greatest remedy of all ages.

Take courage my sister! Relief is within your reach. You may prove the effectiveness of "Orange Lily" without spending one cent. Be assured your letter will be treated as sacredly confidential and receive a prompt and sympathetic reply. Address Mrs. Frances E. Currell, Windsor, Ont., without delay.

The Prince Edward Island Fields of Standing Grain Competition.

(Continued from Page 151)

South Queen's—Judge's Remarks

The crops of oats and wheat, on the whole were good; some were excellent, and a few were rather poor. In some cases lack of fertility was much in evidence. Those crops from selected seed, where soil conditions were tolerable were more vigorous, looked healthier and were more uniform than many crops throughout, where no particular care was taken. Good cultivation gave large results in every case and an absence of couch grass invariably was noted.

The growing of barley is evidently in its infancy, but two of the fields were really fine.

The weed nuisance is becoming a very grave question. Sow Thistle, Couch grass, Canadian thistle and many others are gradually becoming permanently fixed on many farms. On a few these were kept down by careful cultivation and hand pulling. The roadsides and fencerows are generally neglected and prove an excellent habitat for all classes of noxious weeds. A few days spent every year on every farm would soon result in a clean province. Fields of grain are far more attractive on a clean, tidy well kept farm.

Where the seed oats were treated for smut, very little and in some fields none was found, but where neglected the loss has been quite heavy.

Very little rust was noted in any fields, and only in one or two instances, and then only slightly, did the fly effect the wheat.

South King's—Judge's Remarks

In this district the crops are good, the wheat being especially strong growth, while the oats though more uneven on account of the cold wet weather is yet well filled and should turn out a large yield. Smut is much more prevalent than last year in both wheat and oats, some wheatfields being very bad with bunt while loose smut in oats will greatly decrease the yield. Where any care has been taken in seed treatment very little loss will occur, but where no teratment was given the losses will be great in nearly all cases. Insects have also done considerable damage, joint-worm being very bad, while some fields have been attacked by weevil. The heavy wind and rain storms have also created havoc, the grain being badly lodged and tangled up.

West King's—Judge's Remarks

The same remarks might apply here as in South Kings. Bunt and loose smut are very common, while joint worm, weevil and in some cases Hessian Fly have destroyed considerable of the crop. The crops were better than last year in this section and only for the severe storms which broke them down coupled with the infection from smut which will greatly lower the yield the scores would be much higher. Sow thistle and Canada thistle were very common and are proving a grave source of annoyance to the farmers. Nettle, Vetch and Wild Buckwheat are also very prevalent. The majority of the fields in both districts are infected with the above weeds.

East King's—Judge's Remarks.

There was a strong competition in wheat and owing to this many fine fields did not get a place in the awards.

A very large percentage of entries in Wheat were White Russian. Old Island Black seemed to be the favorite variety of oats. Many fields were badly lodged by the wind storm of Sept. 4.

The Average Hog in Farm Economy.

(Continued from Page 155)

intrinsic productive capacity for the direct satisfaction of human wants. The farmer himself is the first one to be satisfied and in the future farm enterprises will be more self-contained than in the past. We will have to cut down on the canned goods and hunt a favorable exposure for corn and tomatoes in the kitchen garden plot. We will find more use for skim milk, whey and small potatoes. We will use our wheat straw to bed the little pigs and the tailings to keep the shoats going. We will supplement our grain growing with fodder growing as alfalfa, peas, rye, rape, and grain mixtures to help the land, increase our livestock production and put the streaks in the bacon. This is both home-making and money-making. It is into a scheme like this that the brood sow fits well or perhaps a couple or half a dozen as judgment and experience poitn. The days of plunging, bucking and changing ends quick are over.—By I. McCuig.

Figuring Profits and Apple Orchards.

(Continued from Page 159)

$1.31 a barrel remains for firsts and seconds. Multiplying by 79, the number of barrels to the acre gives $103.49 as the profit an acre for firsts and seconds. Substracting 72 from 93 cents gives 21 cents as the difference between average cost of production and average selling price of culls. Multiplying 37.6, the number of barrels of culls an acre, by 21, gives a loss of $7.89 an acre on the culls, leaving the average net profit an acre in this orchard for the past 10 years, $95.60. Add to this the $25 interest on the investment and we have $120.60 net, or 24.12 per cent on $500, as the annual 10-year dividend from this orchard.—N. E. Homestead.

Transmission of Tuberculosis

In the transmission of tuberculosis from cattle to man, the danger has been so exaggerated as to lead one to believe that no one could escape the disease.

Milk for the cities is being pasteurized, and the butter sold in our large cities is made from pasteurized cream, so that if the danger would be as great as has been exaggerated, there would be no danger of transmitting the disease. An eminent bacteriologist writes that, "So far as I am aware, there is on case on record where it has been conclusively proved that butter infected with tubercle bacilli has been the means of producing the disease in the human."

Another eminent bacteriologist says: "That while it is possible for pathogenic bacteria to maintain their viability in butter for a considerable period of time ,so far as I know, no case of the transmission of disease of any kind through butter has been reported. My personal opinion is that the danger from butter is very slight on account of the very small number of pathogenic bacteria which would be likely to occur in butter even if made from unpasteurized cream and the comparatively small amount of butter which is consumed."

In fact, never in the history of the country has there been such good butter, milk, cream and cheese sold as there is today, and no products are as healthful, nutritious, and cheap as are those from the dairy cow.

THE JOYS AND WOES OF THE SLEEPING CAR CONDUCTOR

(By A. H. Lindsay)

My definition of the average sleeping car conductor, if asked for would read soemthing after this fashion:

"A gentleman of quick judgment; a diplomat, suave and obliging, polite and attentive; with a very large capacity for carrying other people's burdens, and for bearing the brunt of other people's blunders, with a keen perception for the rectifying of the same."

Of course, this definition would not fit every conductor. It would be too elaborate a cloak for some, and not sufficiently large for others. It is intended to fit those who are the best known on the lines of the Canadian Government Railways, for I can state without fear of contradiction that experienced travellers regard the latter as the most courteous and obliging in the business.

All railway men have their troubles. We often have to diverge from the smooth paths that are bordered with fragrant flowers and walk over the stony places. We have men in each branch of the service who imagine their own particular cares are greater than those of anyone else. It is all in the point of view. I have seen officials in a ferment over something that appeared to me to be altogether unworthy of such a display of wrathful energy; while I daresay I have fumed and used censored language over things equally trivial to others. We all do. It is a weak spot in human nature.

So having all this in mind, it is no wonder that I feel inclined to hand a bouquet to our sleeping car conductors who are the intermediaries between the railway and the most particular class of travellers. The problems they are daily confronted with are often sufficient to make most of us who think we have worries seek refuge in the Japanese relief of hari-kari. Great as is the care exercised in the sale of seat reservations, mistakes will happen. If thehy are not made by the railway they are made by the passenger, although the latter seldom admits it. It is a hard situation to overcome on a crowded train when two persons claim the same berth or seat, and both hold tickets entitling them to it. It puts it up to the conductor to do some rapid thinking and re-arrange his space so that everyone will be satisfed It is indeed a time for diplomacy and concessions, the liability for the error being determined subsequently. It may be that some innocent party whom the conductor knows, may have to come to the rescue by giving up a comfortable "lower" to one of the irate ones. This has been my own experience more than once, and I might say that beyond its being the duty of any railway man, there are few who wouldn't do it just to take the awful strain from the conductor's feverish mind.

The conductor's quick judgment is frequently shown. Not long ago on the Maritime Express leaving Montreal, an elderly lady wanted a seat on the chair car that goes as far as Mont Joli. There were chairs available, but the conductor noticed that her ticket read to Metis Beach. "Why are you going by this train"? he asked. "You will have to remain at Mont Joli over night, and you could hake a through connection by taking the Ocean Limited this evening." The old lady fretfully replied that she had been direct-

The "every purpose" Ammunition -

For every popular gun - every kin of game—every shooting purpose—there's a Dominion load of a size and power that's exactly right. Five kinds of shot shells in all standard gauges.

More than a hundred different metallics—from BB caps to high power sporting cartridges All powders used are standard—black and smokeless—(also Lesmok in 22's.)

Materials and manufacturing methods are 100 % perfect. The system of inspection and testing is rigid and accurate. Guaranteed dependability is the result. Send 10c for 16 game pictures

ed to go by the morning train, while the conductor explained to her how much more comfortable it would be if she took the "Ocean" that evening. "Now, you get off at St. Lambert," he said, "and take a car back to Montreal, and get a berth on the 'Ocean' tonight. Your baggage will be all right." The lady followed his advice and no doubt was well pleased eventually. This was a case of looking after a passenger's welfare, which showed that he had clearly the interests of the railway in view.

On the same train the same conductor encountered a passenger whose berth ticket was dated for the train on the following day. The passenger was going a day ahead of his reservation and it was hard for the conductor to convince him that it made any difference. There was not much vacant space and the conductor had to do some wiring in order to get the matter arranged satisfactorily. For none of the mistak s was he responsible; but being present in the flesh he was obliged to be the target for the inevitable indignation and criticism, as indeed he often is for many things ov r which he has not the slightest control.

The conductors on the through sleeper between Halifax and Boston certainly have their troubles at the commencement of the season, especially on the run out of Boston. Here, again, mistakes sometimes happen in assigning space, and when this occurs passengers for points east of St. John find themselves on the St. John car, while passengers for McAdam Junction and St. John fill up the lower berths of the through Halifax car. This is apt to be the cause of angry comment on the part of through passengers who find they have to transfer, when such transfer might have been avoided. The conductor of course is not to blame; but, as usual, he has to bear it all.

These are only a few of the "trifling worries" of the sleeping car man. He has to deal with all kinds of domestic problems en route, as well as to see that the conventions are strictly observed. The difference of opinion regarding the ventilation of a car are at times sufficient to make the angels weep. Some like it hot; some like it cold; some like the atmosphere nine days old. The aggressive healthy young person in one section wants the window open, while the dear old gentleman in the next seat cannot endure such a draught. Some retire early and then demand that all the car lights be extinguished, while others prefer to remain up and converse. Of course the conductor and his porter are expected to instantly comp y with every demand and it is really marvellous how they manage to satisfy so many. Diplomats? Yes.

The story is told of a sportsman who wanted to get off the Ocean Limited at a small station in Quebec where he was to get some fishing. He arranged with the porter of the sleeping car to arouse him in good time, and took care to instruct him that no matter how much he objected to being awakened at such an ear'y hour, he was to get him up and see to it personally that he was put off the train. The porter promised he would, and the sportsman retired to obtain a few hours' slumber. It was well on in the morning when he awoke, to find that he had been carried past his station. Mad clear through, he sought the offending porter, who gasped with dismay when he caught sight of him. "Here! You rascal," the passenger exclaimed, "didn't I tell you to put me off the train at ———?" "My soul, boss," exclaimed the porter, "I declare to goodness I done thought I did put you off." "Well, you didn't," said the pasenger. "You didn't come near me at all. "Well, boss,' 'said the confused porter, "if I didn't put you off, who was the pasenger I did put off? He sure kicked some, but I landed him on the platform. Yes, Sah."

Annual Meetiug of Sussex and Studholm Agricultural Society.

The annual meeting of The Sussex and Studholm Agricultural Society was held in the live stock judging pavilion of the Agricultural School, Sussex, on Wednesday, December 1, at 2:30 p.m., J. T. Prescott, the president, ccupied the chair. Despite the inclement weather and the bad roads there was a representative gathering of old members as well as of over half a dozen non-members, who had heard of the good work the society is accomplishing for the farmers of the two parishes and who wished to join the ranks and share the benefits.

The president referred to the very successful operations conducted during the year. The minutes of the last annual meeting and directors' meetings since held were read by the secretary, all of which were approved as read.

The Seed Fair held under the auspices of the society last March, had been the most successful in ten years. Over $120.00 was paid in cash prizes. The Seed Fair is open to any farmer in the county of Kings and the directors at Sussex welcome exhibitors from districts outside the limits of their own parishes. The first stormy day would be an opportune time to get a few bags of grain in readiness for the next seed fair. Parties not members of the Sussex and Studholm society wishing to make entries may forward their names to the secretary and a copy of the new prize list will be forwarded to them as soon as it is ready. The fair will be held in 1916 some day in March. Date will be announced later.

The field crops competition of 1915 was one of the best in the history of Kings county. Competition was very keen and the sum of $360.00 will be paid as prizes some time this month. The competition is open to farmers in the County of Kings and the directors would welcome more entries from other sections of the county. There will be a competition in 1916. Prepare to sow good seeds, wheat, oats, barley and buckwheat. See that you get the very best turnip seed available. Prepare your soil as thoroughly as you know how and then make your entries. The judges will visit you in good season and if you do not win a prize you will be told why and it may be that you can apply a remedy that will get you in good form for winning in 1917.

The lime grinding operations have proved very satisfactory. The ground lime was sold to the farmers at $2.10 per ton.

Members who sold their wool co-operatively realized the following prices: No. 1 tub washed, 45 cents per lb; unwashed, 37, 35, 33 and 31 per lb. according to grade. We understand these were the highest prices realized in the Maritime Provinces or Quebec. How much did you get for your wool? Enough said. Join the society, sell co-operatively and get the highest market prices. The treasurer's and auditor's statements showed a balance of over $160.00.

The following officers were elected for the ensuing year:

President—J. T. Prescott, re-elected.

Vice-president—J. Titus Barnes.

Directors—Hon. J. A. Murray, M.L.A.; Col. H. M. Campbell, F. Leslie Walker, W. F. Mosher, H. R. McMonagle, W. H. Venning, H. B. Parlee, E. O. McIntyre, J. Frank Roach, A. D. Freeze, Thos. Bell, S. C. McCully, Walter Stapleford.

The secretary gave notive of motion that at the next annual meeting he would move a motion to change the date of annual meeting from December 1 to November 1.

Last years committees were re-appointed.

Delegates to the annual meeting of the New Brunswick Agricultural Societies United: J. Titus Barnes and F. Leslie Walker.

Substitutes—Walter Stapleford and H. B. Parlee.

Fertilizers will be purchased through the New Brunswick Agricultural Societies United.

At the close of the meeting Mr. Jenning of the Live Stock Division, Ottawa, met the wool growers and gave an itneresting talk on the care and marketing of wool. H. B. Parlee, was elected president of the local wool growers centre, which will be conducted under the auspices of the Agricultural Society. A committee of three was appoitned to work with the president and secretary as an advisory board on wool sales.

The new board of directors met and re-appointed M. A. MacLeod secretary-treasurer. The question of a Kings county exhibition, to be held in Sussex, was discussed. The Minister of Agriculture was present and pledged his support. He spoke very favorably of what exhibitions are accomplishing in communities where the rural and urban residents work hand in hand to make their fairs a success.

Hon. J. A. Murray, J. T. Prescott and M. A. MacLeod were appointed a committee to talk the matter over with the Sussex Board of Trade.

Dressing for Pruning Wounds.

Fruit growers have long used paints, tars, waxes and other substances as coverings for wounds of trees. Curiously enough comparative tests of the many compositions in use seem not to have been made to ascertain the value of these dressings. Tree pruners seem to have taken it for granted that some covering was necessary for large wounds, at least, and have applied the most suitable material at hand.

The New York station has sought to answer the question, What is the best dressing for a tree wound? Also, Is a dressing necessary? The station concludes from tests made that undressed pruning wounds have healed more readily than those whose surfaces have been protected. Shellac seemed the first season to exert a stimulating influence upon the wounds, but the second season this effect disappears. Of all the materials used, shellac was the least injurious. It, however, does not adhere well to wounded surfaces.

The station advises that avenarius carbolineum and yellow ochre should never be used, since they cause much injury to the tree. Coal tar also is injurious. White lead and white zinc, while causing some injury at time of application, are not generally the cause of permanent trouble. The station believes that peach tree wounds should never be treated with any substance. It infers that this is true of wounds on trees of all stone frluits. The most far-reaching conclusion of the station is, that it is not worth while to treat wounds, large or small, of tree fruits with any of the substances in common use. In case it is thought best to cover large wounds white lead is undoubtedly the best dressing to use.

Getting Rid of Thistles.

After sending down its roots for a few inches the thistle then sends out a number of lateral shoots or roots. To be successful in killing thistles they must be cut off above the branching set of roots, either by light ploughing, or by a cultivator with broad shares, so that no thistles can escape when once the field is gone over. Some thistle roots penetrate very deeply, and it would not be an easy matter to get to the bottom. Thistle roots have been found 12 inches down in hard clay. This need not deter anyone when the main secret of killing them is known, and that is to keep the thistles cut for one single summer either by light ploughing or by any other means, and not let them at any time get more than two inches or three inches high. Some hold the mistaken idea that the best ttime to kill thistles is when they are in full bloom. If thistles are allowed to grow until they get in full bloom, killing for that season is out of the question. The root of the thistle is something like that of the potato, in that each is composed principally of starch. By the time potatoes get in full bloom there will be young potatoes formed, and if these were taken up and preserved from frost, potatoes could be grown from them next season. The very same can be said of the thistle. While the stalk is growing it will be storing away starch in its root like the potato, and by the time it is in full bloom it will have stored away sufficient to live on for another season; but, on the other hand, if it is cut every time it appears above ground, it would be deprived of its breathing power, and death would be the result. The leaves of a thistle are just as important to sustain life as are the lungs of an animal. An animal breathes through its lungs, and a thistle breathes through its leaves; so no more could a thistle live without leaves than an animal could without lungs. The main thing to be observed is to cut the thistles before they get more than two inches or three inches above the ground. Use any kind of implement that will suit the varied conditions. In meadow or grain fields the spud should be used, and for a root crop the horse and hand hoe; but if the thistles are very numerous and a summer fallow is resorted to as a means of cleaning the land, then the plough or cultivator with wide shares will be a very suitable implement. Much can be done towards reducing thistles by growing a thick crop or rape. This, grown thick, prevents the thistles from having the full chance to develop, and will consequently reduce them very much. Plowing the stubbles with a shallow furrow immediately after harvest, and again later in the autumn, will reduce them considerably and will destroy all seedlings.—T.

The Value of Farm Yard Manure.

According to recent statistics, there are in Canada in round numbers, 3,000,000 horses, 6,000,000 cattle, 3,500,000 hogs, and 2,000,000 sheep. Experiments indicate that the approximate value of the fertilizing constituents of the manure, both solid and liquid, produced by each horse would be $27, by each head of cattle $20, by each hog $8, and by each sheep $2. This would make the total value of the manure produced in one year by the different classes of farm animals in Canada amount to $233,000,000. The importance of this by-product of the farm may be better realized if we compare it with some of the other principal products of Canadian industries. The following table shows the value of some of the leading products:

Total wheat crop, 1914	$196,000,000
Total oats crop, 1914	151,000,000
Total forest products, 1911.	180,000,000
Total mineral products, 1913	145,000,000
Farmyard manure, (average 5 years)	233,000,000

The figures given in the above table are for the years in which the value of each product mentioned reached the highest point on record, while the figures for the manure represent the average annual production for the past five years.

Assuming that one-third of the value of manure is annually lost by present methods of management, and this is undoubtedly a conservative estimate, the loss from this source in Canada would be about $78,000,000. Surely the farmer can not afford to throw away a sum of money that would more than pay his taxes. But that is just what many are doing. Recent investigations by the Commission of Conservation show that 90 per cent of the two hundred Ontario farmers personally visited by the Commission in 1914, exercise no special care to prevent waste. The natural manure is a part of the raw material for farm crops, and, as such should receive the same attention and care to prevent loss and waste as is given the raw material in any manufacturing plant.

A fact worth knowing and remembering by the farmer is that the losses caused by leaching or super-heating represent the most readily available portion of the nitrogen and potash in the manure, which is, consequently, worth more than that left in the manure heap.

It is hard to persuade the farmer to abandon time-honored customs, such as piling the manure under the eaves or on the hillside, but surely in this days of wider knowledge and of more intelligent farming we should refrain from waste.—F. C. N.

Filling the Silo.

A great deal of attention has been given to the construction, cost, and utility of the silo, says a writer in Hoard's Dairyman. It has been a comparatively new thing in parts of the East and for that reason these points have received special prominence. The man who has a silo is naturally confronted with the question of when to fill it.

Putting up silage at the wrong time has done more to make this kind of feed unprofitable than anything else. There is a strong temptation to put the corn in too green. It looks good, the cattle like it, and it is very heavy when the ears are in a soft condition. The inexperienced person naturally thinks it will come out of the silo as good as it went in. The facts of the case are entirely different. If corn is put in green it produces a sour, acid feed which is disliked by the stock at first and has an undesirable effect upon the digestive organs.

Corn that is in the right stage for cutting and shocking is in the right stage for the silo, generally speaking The leaves will be fully mature but the stalks and leaves will be still green. This kind of corn produces the largest amount of feed while the immature ears in the unripe silage cause a loss in feeding value of this part of the crop. When the kernels are glazed and hard they have practically as much food value as when the corn is

Big Drop in Prices of FURS AND FUR GARMENTS

No matter where you live or what you or your family want in Furs, or Fur garments, you can buy cheaper and better by dealing direct with us.

It will pay you to send for our Fur Style Book, 1915-16 edition, SENT FREE on request which contains 34 Pages of Illustrations of beautiful furs, and will tell you how you can buy cheaper and better from us under our system of

FROM TRAPPER TO WEARER

When you realize that we are the largest cash buyers of Raw Furs in Canada, purchasing direct from the trapper, you will appreciate the unrivalled opportunity we have to select the finest skins, manufacture them into desirable Fur sets and Fur garments, then by selling direct by mail save you the middlemen's profits.

You will be astonished to see the beautiful Furs you can purchase from us for a little money, every one a gem in its class

This season furs are lower in price than ever before, owing largely to most of the European markets being closed on account of the war, but the stock of Raw Furs in America now is so low, that prices are stiffening up, and it looks to us as if they will advance steadily from now on. You should buy your furs this season *without fail*. Remember our Fur Style Book prices mean goods *delivered to you, as*

WE PAY ALL DELIVERY CHARGES.

Every article is sold under OUR POSITIVE GUARANTEE to "SATISFY YOU OR REFUND YOUR MONEY".

The furs illustrated here are taken from our Fur Style Book, and give you but a faint idea of the numerous bargains offered to you, which are shown in our Fur Style Book. Should the furs shown here meet with your approval, send us their price, and we will ship at once, delivery charges paid by us, and guaranteed to be satisfactory.

Big Ben

He's Had Farm Experience

On thousands of farms, Big Ben has been the clock of all work—ringing up the people who must get out early, and telling the right time of day to those who stay 'round the house.

Big Ben works 24 hours at a stretch—puts in overtime without extra pay, and never botches up a job.

He's husky, deep-voiced and strong. His call is clear—his bold numerals show plainly in the dim light.

If your dealer hasn't him, a money order addressed to his makers, *Westclox*, La Salle, Illinois, will bring him postpaid. $2.50 in the States—in Canada, $3.00.

TRY .AN .AD. .IN .THE .MARITIME .FARMER—IT .PAYS

dried up enough to put it in the crib.

In Dry Weather.

If the weather is dry and hot, the corn will ripen quickly and the stalks and leaves will become dry and hard within a day of two. In such a season the corn should be cut a little before the ears are thoroughly matured. If the corn is allowed to get too ripe the stalks become woody, the sap is dried out, and the silage does not pack readily in the silo. However, it is better to have the silage cut dry than too green. The majority of the machines at the present time are provided with facilities for wetting the stalks as they go into the carrier. A small stream of water is turned into the blower and the fanning mixes this thoroughly with the shredded corn. The water has a tenednoy to soften the woody fibres and make the silage pack better. As the silo is being filled more water will be needed at the top than at the bottom because the weight of the column of silage packs that which is in the bottom thoroughly. If the corn is not well packed, air spaces appear and decay takes place, causing more or less loss.

In ordinary seasons the period for filling the silo lasts but a few days after the corn begins to ripen. It turns very quickly and must be handled at once if it is to be saved in the best condition. Frost may come before the corn is cut. In that case little damage will be done if the cutting begins immediately after the frosts. If it is not possible to fill the silo at once, cut the corn and let it lie upon the ground. It may remain in this condition for a week or so without much harm. If you must fill the silo before the corn is ripe, cut the corn and allow it to lie upon the ground in single bundles. In this way, the stalks will wilt and be in better shape for the silo. After one has had a little experience, the question of filling the silo is not difficult to solve. We learn by trying, here as in other things.

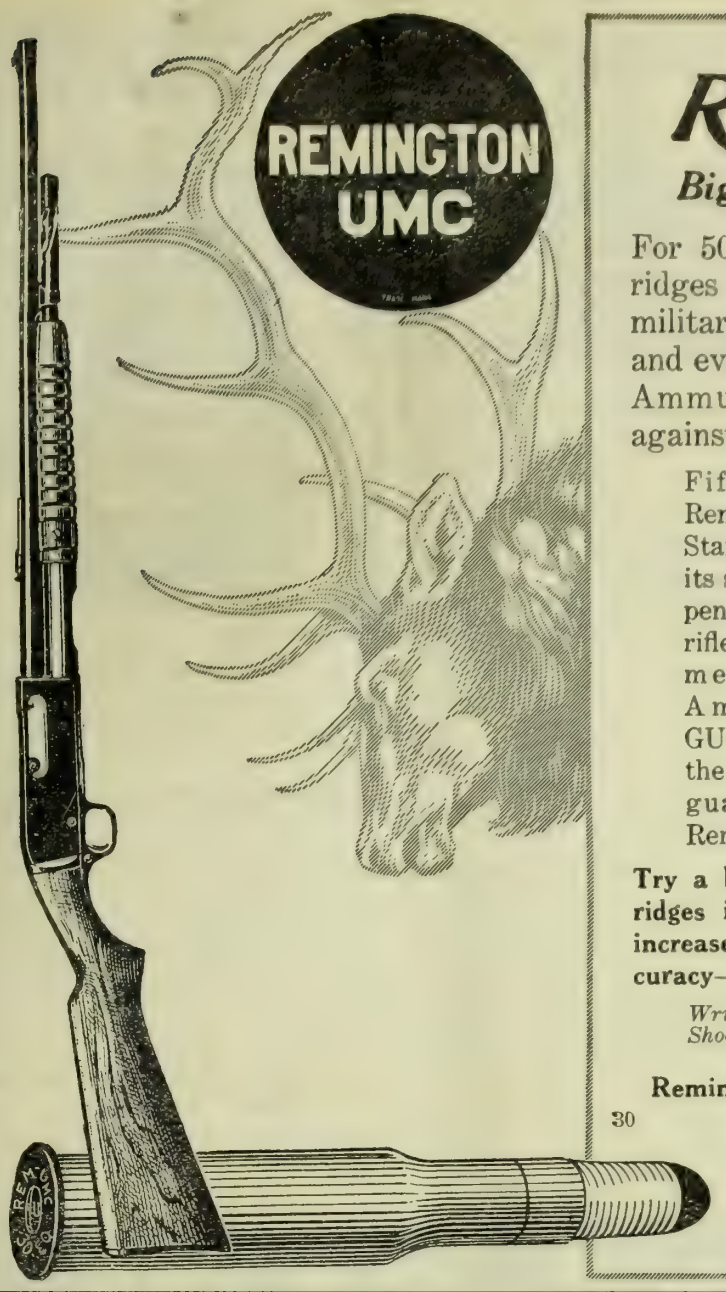
The Crew

The methods employed by the different farmers in filling their silos vary greatly, no two being exactly alike. This is occasioned largely by scarcity of help or teams and by the kind of machinery used. In this section the most common practice is to have one man with three horses on a corn harvester cutting corn in the field; two men to load the wagons in the field; three or four men with teams, depending on the distance from the field to the silo, to haul the corn to the cutter; one man to run the engine, when steam is used for power, and occasionally when gasoline engines are used; one man to feed the cutter, and one man in the silo to spread and tramp the silage. Each teamster pitches off his own load. This makes a crew of eight or nine men.

I find that on my farm I can cut an acre of corn yielding twelve to fifteen tons and put it in the silo for seven dollars or about fifty cents per ton. The same acre of corn would have one hundred bushels of ears that would cost me six dollars for husking alone, which with the cost of cutting, shocking, shredding and grinding would cost me double what it does to put the same crop into the silo. It is usually estimated that it costs seventy cents to one dollar per ton to put corn into the silo, but I know that myself and neighbors put it in for fifty to sixty cents per ton.

The World's Record for Butter-Fat Production Broken.

Malcolm H. Gardner, superintendent Advanced Registry, Holstein-Freisian Association, writes on November 9, 1915: "I am very pleased to be able to announce that the Holstein-Friesian cow Duchess Skylark Ormsby 124514 has broken all records for fat production, not only Holstein-Friesian, but those of all other breeds, by producing in 365 consecutive days 27,761.7 lbs. milk containing 1,205.09 lbs. fat. She freshened at the age of 5 years, 3 days. Her sire is Sir Ormsby Skylark 47010; her dam is Oakhurst Duchess Clothilde 106988. She was bred by A. B. Young, Buffalo Centre, N.Y., and is now owned by John B. Irwin Minneapolis Agricultural College and thirteen different supervisors were employed in its conduct, the test running very evenly month by month from start to finish. This remarkable production gives this great Holstein-Friesian cow place above all other cows in the world and makes her the world's new dairy queen."



Remington UMC

Big Game Cartridges

For 50 years, we've made Cartridges for every sporting and military Arm. For 50 years, each and every lot of Remington-UMC Ammunition has been tested against every other kind.

Fifty years' tests stamp Remington-UMC as World-Standard Ammunition. Prove its superior energy, accuracy, penetration and speed. Other rifle manufacturers recommend Remington-UMC Ammunition. And we GUARANTEE your rifle to the full extent of its maker's guarantee, if used with Remington-UMC.

Try a box of Remington-UMC Cartridges in our Model 14 Rifle. They increase your range—add to your accuracy—insure you a better day's sport.

Root Pulper

More **Sussex Little Giant Threshers** sold this year than any previous year, and still they go. We have a few of each size still on hand and can make prompt shipment. Also have on hand, two machines, slightly used, which will be sold at a bargain to clear, guaranteed, in good repair.

Don't buy without getting our prices, we can save you money.

Our line of Wood Cutters, Feed Boilers, Hay Presses, Grain Grinders, Root Pulpers, Plow Castings, etc., is complete. Ask for our Catalogue. It will pay you.

The Sussex Manufacturing Company, Limited, Sussex, N. B.

Potatoes at a Premium.

Potatoes have already reached a high figure compared with the low prices of last year, and chances are that quotations will go still higher. In Ontario, the usual acreage was planted last spring, and at the opening of the marketing season prices promised to be low. Since then rot has greatly reduced the crop. Reports now being received from both east and west indicate a greatly reduced crop in those sections. The United States crop also is short, and it was probably this shortage that hastened the removal of the embargo on Canadian potatoes.

From present indications we would not be surprised if farmers would realize more from this year's short crop than they did from last year's long one. It will be a great potato crop for the man who sprayed carefully, as in spite of the rain, good crops and clean tubers have been harvested from the majority of well-sprayed fields. The man who sprays will also have an advantage in that he can store his potatoes with a greater assurance that they will not rot in his cellar.

Applied to the Maine Meeting.

In the course of an address at the annual meeting of the Maine pomological society at Portland recently, Prof. Hendricks told the fruit growers that some orchards are inclined to do too much pruning and spraying. "A tree properly started should not be pruned a great deal until after it comes into bearing. Severe pruning throws a tree out of balance and encourages growth of water sprouts which should be avoided. I think that two good sprayings for codling moth and apple scab are sufficient. Of course, if San Jose scale is present, a dormant spray must be given in addition. Several spraying may give a little nicer fruit, but in commercial growing today, every item of cost must be scrutinized and expenses reduced where returns do not offset the extra outlay. On strong soils our New York growers find that trees set 40x40 feet are too close together. The popular distance now is 50x50 feet with fillers on strong bearing soils.

Quarantine as to Poultry From U. S.

Since the outbreak of foot and mouth disease in the U. S., quarantine regulations have covered practically all classes of animals, but, bit by bit, these restrictions have been amended or relaxed. The latest ruling refers to poultry, providing as follows:

"Pure bred poultry for breeding or exhibition is permitted to enter Canada when accompanied by the affidavit of the owner that it has come from an establishment not included in a closed area under federal quarantine.

"Canadian exhibitors will be permitted to return their poultry to Canada after exhibiting at United States shows, providing the show is not held in a closed area under federal quarantine."

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

The Trappers Catch Brought the First Foreign Wealth to America.

Millions of dollars will change hands between the trappers and dealers in raw furs during the coming season. It is indeed wonderful to contemplate, when one thinks of the thousands upon thousands of fur-bearing animals killed every year throughout North America, and still the supply dos not seem to be withering. Many people are of the opinion that the fur industry is becoming extinct, due to the fact that the animals are being killed off in many parts of the country. This is not the case, in fact, it is just the opposite of conditions as they exist. The demand of Fashion, the competition of the large circular houses an dthe general utility of fur garments have sent the price of furs up to such an enormous height that a clever trapper can make a small fortune, if he handles his catch properly.

The fur trade has rightly been called the greatest of our natural resources. No industry, agricultural, mineral, or otherwise has been the origin of as much weath to this country and Canada as the fur industry. Before a single field was cultivated, the fur-bearing animals of this country were the only source of revenue. This was one of the main reasons for the rapid colonization of our country especially of the West. It was the trapper's trail that formed the path of the first highway, and the trappers fur formed the first cargo that was ever freighted on any of the inland waters o this country. It was also the trapper's catch that brought the first foreign wealth to this country, and ever since we have been practically supplying the world with furs. No other of our natural resources have been productive for so long a time or have yielded such an aggregate vealth as the furbearing animals, so fater all, the fur industry is not dying out. The fight is getting keener, and this promises to be the banner year for the trapper and fur shipper.

The Tenth Annual Convention of the Canadian Independent Telephone Association was held in Toronto on November 10th and 11th, and reports state that the convention was one of the most successful in the history of the organization. The attendance was good and the discussion of practical telephone subjects brought out much of interest and benefit to those interested in local telephone companies. The reports show that the Independent telephone development in Ontario has taken a very prominent place in the established investments of the Province, there being at the present time something about five hundred and forty local telephone systems in operation in Ontario alone according to government statistics. These companies represent an actual cash investment of about five million and a half dollars, which with the investment represented by free service of organizers and officers, free poles, etc., would probably bring this investment up to six million and a half. These systems are serving about 76,000 subscribers. It was felt that the development was on the increase, especially of municipal systems which are working out very successfully. The following resolution which was adopted by the convention indicates the appreciatio nshown of the encouragement and assistance given to the local systems in the province:

Resolved that this meeting of delegates assembled at the Tenth Annual convention of the Canadian Independent Telephone Association records its sincere appreciation of the services rendered to the local and rural telephone systems within the jurisdiction of Ontario by the provincial legislature in the enactment of "The Ontario Telephone Act" and all amendments thereto, and further congratulates the Ontario Railway and Municipal Board upon its fair and impartial administration of that Act which has resutled in very material assistance to the successful development of the telephone service of the province and has in many cases overcome difficulties which would otherwise have been insurmountable.

The Zig-Zag Cedar Roll Fence Has Outlived its Usefulness.

There is a growing sentiment in the country at large against the old zig-zag rail fence of primitive settlement days. This fence was never conceived to be pretty; but it was useful, cheap and easily put together. It's time, however, is now past and farmers who take pride in their farms are doing away with them and substituting neat, safe and effective wire fences.

The zig-zag wooden fence developed out of the superabundance of timber in parts of the country where it was prevailed and still prevails. Timber, through wanton destruction and absence of care, has now become scarce, comparatively speaking, and it would cost the farmer of taday something to fence his fields with the valuable rough-hewn rails used by his grandfather or great-grandfather. This is one of the reasons why these fences are not being built today. Timber is too valuable to be used for such a purpose. But so good is th ewood in many of these old snake fences that they will prevaill for many years to come, with a little repairing, unless a determination and a movement sets in to remove them and substitute more sightly field barriers. Nor, again, is this likely to take place, unless it can be demonstratedt o the average farmer that he has something to gain by the change. Well, there are things to be gained, as can very plainly be shown.

First, the zigzag fence takes up too much room and monopolizes too much land. Each triangular patch becomes in course of time a bed of weeds, the seeds of which blow over the otherwise clean, cultivated fields. Even if a farmer were determined to keep these fence lands free from weeds, he would have the greatest difficulty in doing so, because of the angular form of the vacant patches. But there is little or no attempt ever made to interfere with them and they are generally allowed an unmolested and mischievous existence. Lastly, they are not beautiful—the old snake fences—and othing can ever make them beautiful. But they are peculiar to Canada and form a common landscape object that has come to be ahabit with previous generations. There is so much in custom and association that our grandfathers and grandmothers, no doubt, thought them beautiful, simply because their eyes became accustomed to their homely aspect and their necessary existence in dividing one field from another; but, whether driving along the country roads or speeding by in a railway train, there is no doubt that the old zig-zag fences weary the eye of the traveller and impart a wooden appearance to the landscape. The fence is to every field and every road what the frame is to the picture. The frame gives the picture its setting and the fences are always a characteristic of a country. Hence the more pleasing to the eye, the neater, the more they beautify

FREE COMPLETE HOCKEY OUTFIT

BOYS—Don't pay $5.00 or $6.00 for a hockey outfit, when you can get **ABSOLUTELY FREE,** this magnificent outfit complete, consisting of a pair of splendid, strong, polished steel, hockey skates (all sizes), a good lively puck, and a strong, well-made rock elm hockey stick, and in addition every boy can secure as an extra present, a dandy pair of well-padded hockey gloves with fingers and wrists protected by cane splints covered with leather, or a pair of strong, heavy hockey boots with specially padded ankles and reinforcements across the insteps. **WITH THIS SPLENDID OUTFIT YOU WILL BE THE BEST EQUIPPED PLAYER ON THE TEAM.**

Hurry boys! We arrange to stand payment of all charges on your outfit right to your door under our reimbursement plan. 67

Address: **REGAL MANUFACTURING CO. DEPT. H. 3 TORONTO, ONT.**

the landscape. Not that the wire fences which are slowly but surely taking the places of the old snake fence are picturesque, but they are neat and set off the fields and the crops and the landscape in general to much more advantage. They seem to open up the beautiful fields to the eye and give an air of cleanliness, orderliness and nattiness to the whole country side.

Moreover, if it came to a sale of the farm, good wire fences would be quite a valuable asset. Besides bringing under cultivation much new valuable land, they improve the value of the farm lands as a whole.

Another grave disadvantage of the old zig-zag fence is that it does not lend itself very readily to gates on a farm snake-fence consist of four or five heavy rails which are not too sightly and are very inconvenient in the handling. The opening or shutting of such a gate is quite a job in itself. The wire fence, on the other hand, has wire-fenced gates all adapted to it, which open and shut with perfect ease.

Of course, like every other improvement, it may cost a little money to replace the old-time fences with modern fences; but when once a beginning is made it is woonderful how quickly a movement of the kind will spread. And there is now excellent fencing material to be got atreasonable prices.

A good place to begin the introduction of modern fences would be around the house and farm yard, with the lane or approach that leads from the highway tothe house, with the fence between the lawn and the highway, or with the farm yard itself. From these points the movement could be applied to the fields nearby, and thus the change and the expense attending it be spread over several years. Around the home it would be even better to plant some ornamental hedges, both as a shelter and to improve the home landscape. It would take Canada many generations to get the beautiful, and in summer flower-scented, lanes and roads that are a special feature of the English and other national landscapes. Our Canadian farmers would have to plant and grow hundreds of thousands of miles for hedges. All that requires long years of growth and development. But there is no reason why our rural landscape should not be greatly improved in appearance and utility by the adoption of the wire fence to replace the old-time zig-zag. It is well for a rural community to cultivate the aesthetic as well as the material and spiritual, and this would be one way of doing so.

Short Courses at the Sussex Agricultural School.

The Maritime Farmer again wishes to call the attention of its readers to the free ten days' course in Agriculture at the Agricultural School, Sussex, which will be held from January 11th to 21st, 1916.

The only expense to any one attending will be board while at Sussex, and railway fare at reduced rates. This course includes lectures and demonstrations in live stock, dairying, poultry, field crops, soil management and drainage, horitculture, beekeeping, fertilizers, insect pests, plant diseases and noxious weeds.

Purchase a single first class ticket to Sussex and get a standard certificate from your ticket agent.

A list of suitable boarding houses will be provided to students. Applications for enrolment in this course will be received up to January 10th. Send your application to A. G. Turney, Fredericton, N.B.

Nervous Dyspepsia

The Modern Scourge
and How to Meet it.

The speed at which we live, the hustle now so necessary for success have unfortunately a very adverse effect on the nervous and digestive systems of Canadians. The baneful results, increased lately to an alarming degree, often lay the seeds of more deadly trouble, but it will be satisfactory to learn of the ever-increasing popularity in the Dominion, of the Great British Remedy, Dr. Cassell's Tablets.

Dr. Ramsay Colles, J.P. of the City of Dublin, a man of high eminence in the scientific world, says :—" I have great pleasure in expressing my satisfaction as to the curative effect of Dr. Cassell's Tablets in cases of nerve troubles. From several cases which have lately come under my notice I am able to form the opinion that Dr. Cassell's Tablets constitute a safe and reliable family remedy, and appear to be specially effective for nerve and bodily weakness."

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-Spasmodic, and of great therapeutic value in all derangements of the Nerve, Digestive, and Functional Systems in old or young. They are the recognised modern home remedy for Dyspepsia, Nervous Breakdown, Stomach Catarrh, Kidney Disease, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto ; 1 tube 50 cents, 6 tubes for the price of five.

SKILL IN FIGURING.

Competition has made it necessary for every business man to know accurately what the cost is to do business. In manufacturing lines cost is figured in decimals from the raw material to the finished product A man must know the percentage relation of expenses, rent, power, etc., to finished output. If you are rapid in calculation, you will add many dollars to your pay envelope. That is only a part of your training at this school. It pays to attend the Moncton Business College.

Geo. J. Schmidt, Principal
Moncton, N. B.

Try an Ad in the FARMER

What Community Wears This Shoe?

Here is a picture of a farm of 240 acres: In the road in front of the house is an old harrow piled up against a fence; in the back yard are a driving cart, a water cart, a plow, a self-binder, three cultivators, a low-wheeled seeder, a buggy, a power wood saw, a horse power and a disc harrow. In the barnlot are three farm wagons, one spring wagon, two hay frames, three cultivators, a manure spreader, a manure cart, a bob sled and a grain drill. In the lower feedlot is a hay loader; out in the pasture a four-section harrow, close to the turnip field gate a double-row cultivator, with the tongue run over the fence. A little farther down the lane is a four-section harrow laid up against the fence. In the meadow, close to the gate, is a side-delivery hayrake; over towards the centre of the field a mowing machine where the last swath was cut. Whether there are any more tools further back on the farm I am unable to say, as this is as far back as I have ever been.

There is no modern ten-room house with bath, furnace heat, hot and cold water, sanitary plumbing, electric washers, ironers, churners, bakers and cookers. There is no $5,000 barn fitted with manure, grain and litter carriers, modern stalls, bird-proof roller doors, paved yards, concrete tanks, windmills or gasoline engines. There are no good fences and gates, and no fine large herds of stock. There is a hay-carrier in the barn, a telephone in the house that can be used to speak to some neighbors when the sun, moon, stars an dall the rest of the planets and signs are just right, and a rural delivery route within one-half mile of the front door.

This sounds like an exaggeration, but it is not; it is a statement of facts as they actually exist. Neither is it an exceptional case, for it can be duplicated at any time without traveling very far in any part of the country.—Jason Cover, in Breeders Gazette.

A Remedy for Tail-Rubbing.

After several years' experience I have found the following to work very satisfactorily as a remedy to prevent horses from rubbing the roots of their tails:

Take a strong solution of salt and water, made into a brine, and apply it thoroughly to the irritated parts of the tail. One application is usually sufficient; if it is not apply it again. I keep the solution in a paint kag in the barn and when I ontice a horse rubbing his tail, I apply it.—K. C. Bartlett, in Breeders' Gazette

A Silo on Every Farm.

Saves the whole crop.
Insures "June pasture" in winter.
Saves labor and storage space.
Doubles farm capacity for livestock.
Prevents waste in feeding.
Saves frozen corn crop.
Makes better use of grain feed possible.

THE KEYSTONE DEHORNER

The Department of Agriculture has found that dehorning cows adds to their milking value. The KEYSTONE DEHORNER is mentioned in the 1913 report (page 131) as the most effective instrument for the purpose. Write for booklet. R.H. McKENNA, 219 Robert Street Toronto.

A vertise in The Maritime Farmer and get results.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

Fifteenth Annual Maritime Winter Fair

Bigger and Better Than Its Predecessors

An increased and extended list of prizes, greater and better accommodation for live stock and seeds, and commodious, comfortable lecture rooms were the attractions offered by the management of the Maritime Winter Fair in their announcements in the official prize list and in the public press to the exhibitors and general public.

The dates set for the fair, December 6th to 9th have passed and are now receding into the dim and distant past, but the ideas set by the fair live on and will ring true in the years that are to be.

Since the 1914 winter fair was held extensive transformations were made in the judging pavilion end of the fair. The partition which shut off the auditorium from the remainder of the building has been taken down and some of the seats have been removed so that the floor space has been greatly increased. Large windows have been put in the end of the building so that there is an abundance of light for stock judging. Two commodious lecture rooms have been constructed upstairs on the side adjoining the dairy barns. The testing room has been remodelled and in it the DeLaval Dairy Supply Co. have installed one of their up-to-date bottle washing machines, and a steam turbine Babcock tester, both of which are a great convenience for the men who have to do with the testing. There are also commodious quarters for the stockmen.

Exhibitors and visitors alike appre ciate the changes. Spectators can now see the various animals being judged to much better advantage than under the former arangement.

The Official Opening.

Everything was in readiness when the fair building doors were flung open to the public on Monday morning, December 6th. Every stall and pen were occupied. The dairy test was within a few hours of completion and every section of the show was running smoothly. The official opening took place at 8 p.m. on the evening of December 6th. Hon. Murdo McKinnon, Minister of Agriculture for Prince Edward Island, vice-president of the Maritime Stock Breeders' Association, presided and with him on the platform were ten or twelve men who take active interest in the Winter Fair and other public affairs.

Col. H. Montgomery Campbell, the President of the Association, was unable to be present, as he is in Halifax at the head of his regiment, the 64th, and before the evening session came to a close, at the suggestion of Rev. P. C. Gauthier of Prince Edward Island, three cheers and a tiger by hundreds of voices in the auditorium and galleries of the fair building rang true and clear for Col. Campbell, of the 64th.

His Worship Mayor Avard welcomed the visitors to Amherst. Warden Drysdale gave the welcome to the County of Cumberland. Hon. J. A. Murray, Minister of Agriculture, responded to the addresses of welcome after which Hon. A. F. McDonald, Lieutenant-Governor of Prince Edward Island, declared the fair formally opened. The other speakers for the evening were: Hon. E. H. Armstrong, Commissioner of Public Works for Nova Scotia; J. H. Grisdale, Director of Experimental Farms, Ottawa; John Bright, Live Stock Commissioner, and Rev. P. C. Gauthier, one of the big men of Prince Edward Island,—big in stature, big in heart, big in brain, and big in leadership.

The Judges

Beef cattle—F. R. Cromwell, M.P., Cookshire, Que.

Dairy cattle—Alf. Kains, Byron, Ont.

Sheep—Claude Bain, Taunton, Ont

Swine—Prof. E. S. Archibald, Dominion Animal Husbandman, Ottawa.

Poultry—F. C. Elford, Ottawa, J. H. Minshall, Brantford, Ont; Mr. McKinley, Ottawa.

Seeds—E. D. Eddy, Ottawa; J. Artemas Clark, Superintendent Experimental Stations, Charlottetown, P.E.I., and S. J. Moore, Truro.

Dressed carcasses—F. R. Cromwell, Claude Bain and Prof. E. S. Archibald.

Honey—J. Artemas Clark.

Dairy test—Harvey Mitchell; W. A. MacKay and several men prominent in cow testing association work.

The Experimental Farm, Nappan, had a well arranged exhibit of the various products of the farm as well as of models, the last word in barn and stable construction and fittings.

The Live Stock Division, Ottawa, had an interesting display showing the right and wrong way for marketing eggs which attracted more than passing notice by the visitors. The Sheep and Goat Division made a display of various grades of wool. The proper method of rolling and tying fleeces was shown and pictures of the various breeds of sheep were displayed on the walls.

Mr. Reg. Arkell, Chief of the Division, and competent men were on hand to give information to the hundreds of farmers who came in to study the exhibit.

The London Machinery Co., The De Laval Dairy Supply Co., The R. A. Lister Co., The Hinman Milker Co., The Renfrew Machinery Co. and the Empire Milking Machine Co., had booths at the fair and all report a thriving business. The stable and stall fittings shown by the London Machinery Co. came in for much favorable commert. A great many farmers were much interested in the milking machines.

The Beef Classes

Were stronger than ever. The influence of good breeding and feeding is coming into evidence more and more each year. There was a big class of Shorthorns, Herefords, Polled Angus and their Grades. With the exception of a very few animals the fitting had been carefully done. The refusal of Judge Cromwell to place awards last year where animals were ont of sufficient merit has done its work. It is no use to take an ill-fitted animal to the Maritime Winter Fair and breeders and exhibitors have come to recognize the fact. There are, however, a very few men who would bring in ill-fitted stock if there was any chance to take a little easy money, but we are proud to say they are few, and very few, in numbers. The majority of exhibitors at Amherst are of that high class that would deign to take their animals to the show in any other than in the pink of condition even if they were sure that they would not meet strong competition.

Shorthorns

John Bennett was down from Chatham with a bunch of R. A. Snowball's well fitted Shorthorns. J. M. Laird & Son came over from Prince Edward Island with a choice lot. Harold Etter, of Westmorland, was there too, as usual with a string of good ones.

Hazen Etter, Forrest Bros., C. H. Angus, Geo. M. Holmes, F. W. Sumner, Geo. A. Black, Clinton S. Corbett, Alfred Johnson, H. P. Lawrence and Harry Carter were the other exhibitors of Shorthorns. The battle was keen from start to finish and defeats were taken in a sportsmanlike manner. A full list of the prize winners in the respective sections will be found on another page of this issue.

Forerst Bros. had the best steer, a senior yearling by Hero of Strathallan. The champion female and grand champion of the Shorthorn class was the senior calf, White Blossom II, a daughter of White Blossom, the champion of the 1913 Winter Fair. White Blossom is by White Prince by Prince Ideal, the winner of so many first prizes when at the head of Mr. C. A. Archibald's Bellevue herd. White Prince was bred by Mr. Archibald out of Rosabella, also a noted prize winner in the Bellevue herd. The proud owner and breeder of White Blossom II is Mr. Harold Etter, who has for the third time—1911, 1913 and again this year captured the M. J. O'Brien silver cup and whose property it now becomes. R. A. Snowball, who captured the cup in 1912 and in 1914 barely missed winning it again as his Roan Mina, the first prize aged female and winner of the cup in 1914, was the reserve champion.

Mr. Etter says that White Blossom II was one of the smallest calves he had ever seen when she was born as her dam had carried her for only eight months. With the blood of prize winners in her veins and the good care and feeding of Mr. Etter, she developed rapidly and proudly carried of the sweepstakes for her breed.

J. M. Laird & Son captured the R. A. Snowball silver trophy for the best four animals, one under one year, one one-year-old, one two-year-old and on over three years old. Harold Etter captured this trophy in 1913. It will be interesting to follow the wanderings of this trophy until it is finally captured three times by some exhibitor, who's property it will be.

The $10.00 in gold specie prize for the best Shorthorn shown by a new exhibitor was won by F. W. Sumner, Moncton, N.B.

Only three beeves were slaughtered. The first and second prizes on dressed carcasses went to Forrest Bros. on their over 1 year and under 18 months Grade Shorthorn steer and their Grade Shorthorn heifer of the same age, first prize winners in their respective live classes.

Herefords and Aberdeen Angus

cattle competed in the same class. There was quite a contrast between the white faces and the Doddies, in point of color, but very little in point of quality. J. M. Laird & Son had an even, well-fitted lot of the black beauties, the only exhibitors of the breed. Edward P. Anderson, Forrest Bros., Wm. O'Brien & Sons, and B. W. Ralston upheld the traditions of the white faces, with well fitted individuals. Look up the list of prize winners elsewhere in this issue for the winnings in the respective sections of the class.

The sweepstakes prize of the class went to Edward P. Anderson's two-year-old Hereford steer. This steer also captured the International Harvester Co. of Canada Ltd., No. 55 Scuffler prize for the best beef animal, any breed or grade.

The best animal in the class shown by a new exhibitor was shown by Wm. O'Brien & Sons, to whom was awarded the $10.00 in gold special prize.

Grades of Any Beef Breed.

were out in strong numbers with oceans of quality. The lion's share of the first prizes went to Forrest Bros. who captured the sweepstakes for the best garde animal any age with their Grade Shorthorn steer calf. under six months.

Arthur Etter, Wm. Holmes, C. H. Angus, Harry Carter, Geo. B. Etter, Hazen Etter, J. M. Laird & Son, E. P. Anderson, Geo. A. Balck, R. W. & O. A. Coates, Harold Etter and Alfred Johnson were the other exhibitors of grade beef catttle.

R. W. & O. A. Coates captured the $10.00 gold prize for best grade beef animal shown by a new exhibitor.

The Dairy Test

On other pages of this issue will be found a full report of the dairy test, in which 108 cows participated. The 1914 dairy test had 99 contestants in it. Blanch La Honda, the champion of the 1914 test with a total score of 332.57 points as a seven year old, came back again this year and carried off the championship with a score of 300.00 points, on 224.0 lbs. milk, 9.62 lbs. butter fat and 19.28 lbs. solids not fat. Her record at the 1914 show was 273 lbs. milk, 10.51 pounds butter fat and 22.34 lbs. solids not fat.

Miss La Honda is a daughter of Sir Rooker Posch Artis out of Frau La Honda and was bred and is owned by S. Dickie & Son, Lower Onslow, N.S.

The highest score in 1913 was made by S. Dickie & Son's Mercena Artalissa with a score of 259.7 points.

The highest scoring three-year old was W. S. Harding's Sarcastic Lass De Kol, with a score of 249.2 points; 231.8 lbs. milk, 7.61 lbs. butter fat and 19.02 lbs. solids not fat. This honor in 1914 was captured by S. Dickie & Sons, Cobequid Polly Lass, with a score of 227.58 points. In 1913 the score in the same class was 196.56. The highest scoring two-year-old was Logan Bros.' Homestead Ida with a score of 178.4 points; 139.0 lbs. milk, 5.71 lbs. butter fat and 11.94 lbs. solids not fat. This honor was captured in 1914 by W. S. Harding's Sarcastic Lass De Kol with a score of 230.29 points; 203.3 lbs. milk, 7.15 lbs. butter fat and 17.18 lbs. solids not fat. The score of the 1913 class was 177.42 points.

Fowler Bros. had the highest scoring one-year old Holstein, Minnie H. Sprig, with a score of 151.7 points.

Ayrshires

The highest scoring Ayrshire was McIntyre Bros.' Mona D., the winner of similar honors in the 1914 test. She scored 221.3 points this year. Last year her score was 205.86 points. In 1913 the score in this class was 198.4.

A. McRae & Son's Rosabell with a score of 191.1, captured the first honors in the three-year-old class. Their Fairvue Queen was first in 1914 in the same class with a score of 188.80. In 1913 the highest score in this section was 211.8.

McIntyre Bros.' Molly D. came in for first money in the two-year-old section with a score of 133.9. Rosabell, the McRae winner of this honor in 1914 had a score of 141.67. In 1913 the score was 166.7.

F. S. Black's Peach was the highest scoring yearling heifer with 153.4. McIntyre Bros.' Bessie was first in 1914 with 117.43. The 1913 score was 72.85.

Look up in the dairy test tables the high average butter fat test of Prescott Blanchard's cows.

Jerseys

J. E. Baker & Sons' Pride led the aged Jersey cow class with a score of 189.4 points. Their Maud won the honor in 1914 with 174.42 points. The score in 1913 was 201.83.

W. E. Harding's Blood's Fair One was first in the three-year-old class with 198.3 points. Bakers' Queen 8th was first in 1914 with 156.88. In 1913 the score was 189.86.

H. S. Pipes & Son had the highest scoring two-year-old and one-year-old in City Cousin and Brilliant, yet with scores of 119.7 and 105.3 respectively. Baker's Queen led the 1914 two-year-old class with 151.05 points and Pipes & Son's Nordica won the 1914 two-year-old honors with 98.86. The 1913 scores in the two-year-old and one-year-old classes were respectively 149.01 and 136.40.

Guernseys

In the aged cow class D. G. McKay & Son's Daisy was first with a score of 187.3. The 1914 winner was Ruby with a score of 214.15 points. The 1913 score was 175.57.

Hugh A. Dickson's Gypsy Lass was first in the three-year-old class with a score of 156.78 points. D. G. McKay & Sons were first with their Heiress Rosa in 1914 with a score of 156.78 points. The 1913 score was 146.21.

Roper Bros.' Sister Brote of Eastview, led the two-year-old Guernsey class with a score of 146.2 points. High A. Dickson's Gypsy captured this honor in 1914 with 184.5 points. The 1913 score was 112.71.

D. G. McKay & Son's Beauty of Spruce Grove was first in the one-year-old class with a score of 106.3. Dickson's Retta was first in 1914 with 112.9 points.

Shorthorns

Walter Bulmer's May's Maid led the aged Shorthorn class with a score of 141.7. Arthur Etter's cow was first with a score of 106.40 in 1914. In 1913 the score was 149.32. The three-year-old class was led by Alfred Johnson's Lilly Red with a score of 126.3. Geo. M. Holmes captured this prize in 1914 with a cow scoring 71.91 points. The 1913 score was 95.28 points.

Geo. M. Holmes had the highest scoring two-year-old and one-year-old respectively with scores of 107.2 and 62.1 respectively. Alfred Johnson's Lily was first in 1914 with a score of 111.90 and J. McCully Pipes had the highest scoring yearling Shorthorn in 1914 with a score of 66.14. The score in the two-year-old section in 1914 was 102.96.

Grades

W. N. Boomer led the aged and three-year-old sections of the grade class with scores of 233.6 and 177.7 respectively. T. W. Keilor and Fowler Bros. captured these honors respectively in 1914 with scores of 228.20 and 172.72. The 1913 scores were 243.68 and 139.50. Fowler Bros. captured the first place in the two-year-old and one-year-old classes with scores of 189.4 and 160.9 points respectively. Hugh A. Dickson had the highest scoring grade in 1914 with 180.35 points. Fowler Bros. had the highest scoring grade yearling in 1914 with a score of 121.56. The 1913 highest scores in the grade two-year-old and one-year-old classes were 170.77 and 122.37 points respectively. Fowler Bros.' Patty, a grade Holstein, was the highest scoring one-year-old at the fair, 160.9 points.

W. N. Boomer's aged cow was the highest scoring grade 233.6 points.

Study the tables on other pages of this issue for fluctuations in weights, fat and solids not fat.

The Dairy Breeding Classes

There was a splendid aggregation of young breeding stock. Ayreshires, Holsteins, Jerseys, Guernseys and Grades.

Prescott Blanchard had the best Ayrshire, any age, in Hillside Perfection II. by Hillside Peter Pan, shown in the under 18 months class.

Lea & Clark had the sweepstakes Holstein, a junior yearling in Island Bell Rooker.

H. S. Pipes, junior yearling, All Gold, by His Reverence was the champion of the eJrsey class.

Roper Bros.' Beauty's Jennie, of Willow II, a junior yearling, was the champion of the Guernsey class.

Fowler Bros. had the best grade, any age.

Dairy Cattle Specials

Donated by the Holstein-Friesian Association of Canada:

Highest scoring aged cow in test, if a Holstein, $25; S. Dickie and Son.

Highest scoring three-year-old cow in test, if a Holstein, $25.00; W. S. Harding.

Highest scoring two-year-old cow in test, if a Holstein, $25.00; Logan Bros.

Grand Championship, $25.00, if a Holstein, S. Dickie & Son.

Special $18.00 in gold for highest scoring cow in test, any breed or grade, S. Dickie & Son.

The Dickie Challenge Cup for highest scoring cow, any breed or grade in the dairy test, S. Dickie & Son.

Highest Scoring grade cow in dairy test, W. N. Boomer.

Sheep

The sheep classes were well fitted throughout.

Albert Boswall Sr., John Retson and Samuel Lane upheld the honors of the Leicester Breed.

Lincolns were shown by Albert Boswall, Ernest Lund and C. D. Pugsley.

Chas. Symes and John Tweedy were the competitoors with Cotswolds.

Cephas Nunn, and Chas. Symes fought the battle royal with their Cheviots.

Geo. Boswall had everything his own way with his Horned Dorsets.

J. E. Baker & Sons, Oliver Saunders and E. Saunders put up a three-cornerer fight in the Southdown class.

Jas. E. Stewart and Geo. Boswall captured all the prizes in the Shropshire class.

Oxfords made a good strong showing with Jas. E. Baker & Sons, J. M. Laird & Son and Burder Goodwin in the ring.

Hampshires were shown by Cephas Nunn and Almon Boswall.

Albert Boswall, Almon Boswall and Parker Horne showed Suffolks.

There was particularly strong competition in the grade classes. They were all well fitted and showed the result of careful breeding by the use of purebred sires. They were the kind that any farmer may acquire if he sticks to the use of a purebred ram of one breed at the head of his flock for a number of years and pays a little more attention to care and feeding. The entire class readily impressed the onlooker as being a bunch of money makers for their owners. See list of prize-winners on another page.

Swine

Were strong in quality, but not so numerous as in former years.

With the exception of second prize on sow over 9 months, all the prizes in the Yorkshire class went to J. W. Callbeck.

Fowler Bros. and A. McRae & Sons had everything their own way in the Tamworth class.

Berkshires were shown by Fowler Bros., Jas. I. Stewart, J. R. Semple, Harry Carter, Saxby Semple and Peter Brodie.

A. H. Boswall and Wallace Stead showed Chester Whites.

The Grades were a good useful lot, with stronger competition than in any other class.

Poultry

The rows of coops in the poultry department instead of being crosswise the building were re-arranged lengthwise with broad aisles and cross passages which was much more convenient than the old arrangement.

The American and Mediterranean breeds predominated. The choicest trophy of the show went to a Barred Rock cock shown by Percy Carey, Yarmouth, N.S.

The birds throughout were a choice lot. It was no disgrace for a breeder to be otuside the money in some of the classes. Frequently there were enough good ones left after the prizes were awarded to make a good show by themselves.

The dressed poultry department was not as well patronized as in years

gone by but the quality of the exhibit was first-class. E. C. Elford, chief of the Poultry Division, placed the awards in the dressed poultry class.

Apiarian Products.

The showing of aipiarian products was small, but good nevertheless.

Grains and Seeds

There was a good showing of grains and seeds. The Seed Division of the Maritime Winter Fair has done much to stimulate the interest in good seed. To win at Amherst, seeds and grain must be of the very best quality and absolutely clean, for the competition is getting keener every year. A full list of awards appear on another page of this issue.

The Evening Sessions of the Winter Fair

The Monday evening session of lectures at the Maritime Winter Fair was presided over by Hon. Murdo McKinnon, Minister of Agriculture for Prince Edward Island, who referred to the splendid showing made by the various exhibitors at the fair, the interest taken in its welfare by the citizens of Amherst, and to the good work done in behalf of the fair by Lieut.-Col. H. Montgomery-Campbell, who has heard his country's call and is now leading the 64th.

The mayor of Amherst welcomed the visitors and exhibitors and said that when the question of alterations to the fair building was introduced to his citizens there was not a dissenting voice.

Warden Drysdale of Cumberland, extended a hearty welcome in behalf of his county.

Hon. J. A. Murray, Minister of Agriculture for New Brunswick, made a very fitting reply to the addresses of welcome. He paid a high tribute to Col. Montgomery-Campbell who had joined the best and bravest of Britain's sons in their stand for the defence of the empire. Our young men have and are responding gallantly and will continue to do so until the treaty of peace is signed in Berlin. He also referred to the splendid response to the call for more production. He emphasized the value of an agricultural education, paying a tribute to the good work being done by the N. S. A. C. He outlined his province's policy re agricultural schools along the same lines as appeared in an interview with him published in these columns an issue or two ago. In closing he said that the Maritime Provinces were no longer looked upon as the shreds and patches of Canada. The other provinces of the Dominion have nothing on the Maritime Provinces where business conditions are more stable than in any other part of Canada.

Hon. A. F. MacDonald, Lieutenant-Governor of Prince Edward Island, delivered the following opening address:

Mr. President:

I am much pleased to be with you this evening at the opening of the 15th Winter Fair of the Maritime Stock Breeders' Association. Although seeds and honey are included in your prize list, along with live stock, live stock predominates at this show and completely overshadows the other sections. I am pleased with this because live stock is at the basis of successful agriculture in Eastern Canada, and agricultural development is best measured in the improvement that is being made in live stock.

Allow me then to congratulate you on the excellence of your show. As it is my first visit to your fair, I may say I am surprised at the quality and number of your beef cattle, at the results which I am told have been achieved in your dairy stables, and at the noise that can be made by exhibition classes of hens, turkeys, geese and ducks.

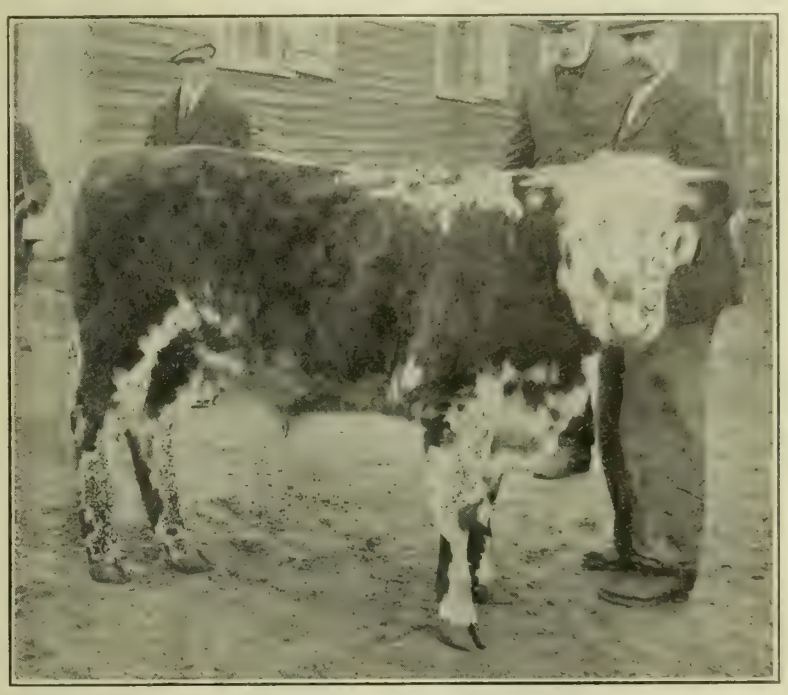
Your exhibit of seeds is not greater than I had expected as we generally have between 500 and 600 at our own Provincial Seed Fair.

I am not in a position to compare the exhibits with those of former years, but I am told that there is a great increase in numbers, and I suppose those who are doing the exhibiting think there is an equal increase in quality.

I do not intend to extend my remarks to any considerable length. I understand that you have on your programme for this evening, and for the next three days, the names of men who have made good in their several lines of agriculture, and I shall confine what I have to say on this subject to co-operation, and the first co-operative effort on which I might like to say something is the Amherst Fair. We have our Autumn Exhibitions held at Charlottetown, Halifax, St. John and Fredericton, and exhibitors from all of the provinces exhibit at each of these Fairs; but the Winter Fair differs from all of them; it is planned, financed and carried through by the combined effort of the three Maritime Provinces, assisted by the Live Stock Branches of the Federal Department of Agriculture. Further, the educational feature of the Winter Fair stands out pre-eminently. At the Autumn Fairs the judges award the prizes and now and again a bystander asks some questions, but here the judges speak on the classes that they have been judging, not only giving their reasons for their awards, but also explaining how animals can be bred, fed and generally cared for to bring them into such an excellent condition. These are 't'he men from Missouri," or I am told very often from Ontario, but what I would like to point out is that these men have fitted stock for the Winter Fairs themselves and are not only in a position to tell us which of these are the best, but also to tell us how it is done, and not only done, but done profitably. These are the class of men everyone wants to hear, and it is because you put men of this kind on your programme that your Fair is so well attended, and that farmers everywhere feel that they cannot afford to miss even for one year "The Maritime Winter Fair."

I am sorry to say that I had not sufficient notice to enable me to deal with one or two other subjects of Maritime interest, such as agricultural Education, and I would like to have told you something of what is being done through co-operative effort in Prince Edward Island—for the dairy our making. It was forced upon us industry, for the poultry industry, for the sheep industry, for the seed industry, and in fact for every department of Agriculture, but I notice that my time is going, and as the Representative of His Majesty in one of the Provinces of Canada I cannot let this opportunity pass without referring to the spirit of co-operation which has found its expression not only in the Maritime Provinces, or even in Canada, but in every part of the world over which floats the Union Jack. This war has been full of horrible doings, it has brought to the light the savage instincts of the barbarous Teuton, but it has also drawn together the separate units of which the British Empire is composed and fused them with the blood of all her best peoples. After Ypres where again can a British subject be found who will think of Canada as a colony, after the famous charge of the Ghurkas, what Briton can think of the inhabitants of India as undesirables? The name of Boer is no longer a synonym for deciet and treachery, and wherever the British flag flies the peoples of the earth will bear witness that the heart beneath it beats true.

Mr. President, Ladies and Gentlemen, this is an awful war; it is not of



A PROMISING GRADE CALF

Sweepstakes Grade at the 1915 Maritime Winter Fair. This steer calf is under 6 months and is owned by Forrest Bros, Amherst Point, N. S.—Photo by Landry.

by our blood thirsty and treacherous enemy, but out of it there will arise a newer earth dominated by the spirit of co-operation and helpfulness, and where mastery shall be sought for the purpose of service.

The Maritime Provinces are doing their part to bring this about. They are sending their quota of men and munitions. Those at home are holding up the hands of those in the trenches, and the Winter Fair is one of the agencies for promoting this most useful service.

Mr. Chairman, Ladies and Gentlemen: I thank you for this opportunity of addressing you. As the Representative of His Majesty from Prince Edward Island I have now much pleasure in declaring this 15th Annual Winter Fair, conducted by the Maritime Stock Breeders Association, formally opened.

Hon. E. H. Armstrong conveyed Premier Murray's regrets for being unable to be persent at the Winter Fair. He referred to the loyalty of the people of Amherst to the Winter Fair. The Maritime Winter Fair was one institution in which co-operation between Nova Scotia, New Brunswick and Prince Edward Island worked admirably and he saw no reason why they should not be equally successful if they co-operated along other lines. Canada had responded well to the Empire's call in men and the fact that the balance of trade is now in Canada's favor is a good indication that Canada is responding in the question of food supply. Business conditions very normal in the Maritime Provinces because their men and industries are of the right metal and clear stuff. Mr. Armstrong referred to the good work that the N. S. A. C. and the N. S. Technical Education Schools are doing. Dairying is progressing rapidly in Nova Scotia. The Rural Science Schools are instilling an interest in nature and agriculture in the minds of the young. In his closing remarks he referred to the good work that the exhibitors at the Winter Fair perform in the education of the masses to higher ideals in the breeding, feeding and care of live stock.

John Bright, Live Stock Commissioner for Canada was the next speaker. He told of the good reports that Mr. Cromwell, the beef cattle judge, had brought to him re the Maritime Winter Fair of 1914 and he was glad to be present at this fair to see for himself the progress being made. The management of the Maritime Winter Fair had been untiring in their efforts to organize and uphold a successful fair. It had been almost a labor of love with the most of them. They worked for nothing and boarded themselves. These men take pleasure in knowing that the fair is accomplishing the work for which it was organized, viz.: the education of the agriculturist to higher ideals in stock raising. There is no profit in feeding and breeding scrubs. Mr. Bright strongly recommended the three provincial Departments of Agriculture to help increase the prize list of the Maritime Winter Fair and in other ways to help make the directors' lot an easier and happier one, and thus encourage the production of more and better live stock. Before closing his discourse he put forth a plea for the better finishing of live stock, the standardizing of products and the co-operative selling.

The work done by the egg circles and the wool growers' associations, have done much along the line of getting producers and consumers together on the question of standardization and are examples of what may be accomplished along other lines.

J. H. Grisdale, Director of Experimental Farms, Ottawa, followed Mr. Bright. He had had the honor of being present at the first Maritime Winter Fair, and he has had the pleasure of visiting it quite frequently since then. He has thus kept in close touch with the progress the fair has made in the fifteen years of its existence. He hade special mention of the men who were associated with the early days of the Fair, some of whom have passed to the great beyond. He referred to the necessity of live stock to the country and the importance of grading up the herds and flocks. The grade herds of the country are the money makers. England and Scotland's farmers have prospered by live stock breeding and Canadian farmers can do the same. In closing he advised his hearers to make the best use of the various Experiment Farms and Stations and the reports and records that are published by them from time to time.

The last speaker of the evening was Rev. Dr. P. C. Gauthier, who is a strong believer in putting a premium on quality. He is doing good work in getting this premium for the goods the farmers of his district have for sale. He referred to the good work that nature study and short courses are accomplishing. He also advocated a Maritime agricultural college instead of a lot of weak separate schools, and closed his remarks by calling for three cheers for Col. Campbell of the 64th, which was heartily responded to by the audience.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

"LOOK FOR YOUR MONEY WHERE YOU LOST IT."

Such was the counsel of a wise father to his son. The boy had failed in some project he had undertaken. Just what it was, we do not know. He might have lost a crop of wheat because of a hail-storm and was afraid to try wheat again. It may be that he lost a drove of hogs with cholera and declared that he would never again raise hogs. Possibly it was new to him and he was not onto the "how" of doing it. Sometimes a person learns more when he fails than when he succeeds. It is the schooling of experience that counts.

A man may fail to make money on a farm. He may find it harder work than he had thought for. That is no indication that he should quit. He is only preparing to begin. Of all lines of business farming is certainly the most flexible in this respect. Every man has within his own power the possibility of increasing or decreasing the profits, of making his work heavy or light according to his managing ability.

The use of proper farm records will show up the why and the wherefor of a lot of the leaks. Plugging up the leaks is one good way of increasing profits. Put down what you do and where you did it, what you spent and where you spent it, what you received and from whence it came. Then at the end of the year look over your record and see how much you did and what you got for doing it. Quit guessing. A guess is dangerous if you rely upon it for dollars and cents.

Some methods of keeping records are easier than others. Get a simple and complete method and you will enjoy keeping a good record.—O. S. and you will enjoy keeping a good record.

The Maritime Farmer wishes its readers, one and all, great and small, all the joys of a Merry Christmas.

FAT AND LEAN.

In the busy world of dairying even a few meagre calculations show great differences, whether in cows, their owners, the land, the bank deposits or the test of fat, etc.; fat and lean are mixed, good results and poor, even on adjoining farms, even in two stalls in the one stable. One owner gets perhaps 200 pounds of milk from each lean, hungry acre; a neighbor, with better methods, produces the fat total of seventeen hundred pounds of milk per acre, keeping 16 good cows on a well tilled eighty acre farm. One milk producer, with poor grade cows, never tested, possibly never well fed, get the lean average of less than three thousand pounds of milk per cow; another producer—who is a real dairyman—revels in the knowledge of each of his sixteen cows, giving over eight thousand pounds of milk that will test fairly rich in fat.

Then when it comes to feeding for profit, not simply for existence, we find one man with a hundred pounds of milk costing him only 59 cents for feed, but a neighbor has to admit the impeachment of milk costing him per hundred at least 90 cents, perhaps over a dollar. So one will make the fat profit above feed of over thirty dollars per cow, while his neighbor is down to the lean margin of only three dollars. Why do such amazing differences occur? Primarily because dairymen have not studied each cow individually. Dairy records alone can shed light on these problems. Milk and feed record forms, simple, easily kept, may be had free from the dairy division, Ottawa. Apply today and make each cow earn a good fat profit.

GREATER EFFICIENCY.

We would direct the attention of our readers to the advertisement that we have been carrying in recent issues of this publication, relative to the Short Courses at the College of Agriculture, Truro, N.S.

These Classes will be conducted from January 4th to the 14th next. Classes are offered for both sexes, those for the ladies to be held in the New Science Hall which has just been completed and the men's classes to be held in the splendid buildings formerly erected on the College Campus.

"Greater Efficiency on the Farms and in the Homes of Maritime Canada," the motto which the Principal has selected for the Courses is a most fitting one, suggesting as it does the unparalleled need for a larger knowledge of farming and also suggesting that every effort will be put forth by the staff at Truro to make the Short Courses help those who are seeking to become more efficient. The course is free to students from all parts of the Maritime Provinces. The railways grant special rates from all parts and the staff at Truro are prepared for the biggest and most successful classes yet held in the history of the College. Write to the Principal at the College at Truro for further particulars.

Being jealous of a successful competitor is foolish; imitate him.

* * *

There are lots of things being blamed on the weather that are really the effect of mean dispositions.

* * *

Did you attend the Maritime Winter Fair? If you did not you missed a treat. The high ideals exemplified in the cattle, sheep, swine and poultry and seeds classes were worthy of your very closest scrutiny. It makes no difference who you are or where you live you could not go back to your home from the Winter Fair without carrying in your mind some lessons in ideals that you would, if at all a live farmer, strive to emulate.

* * *

Before the next issue of the Maritime Farmer reaches our readers, Christmas, 1915 will have passed into the past. We will all be on the threshold of the new year, 1916.

Many changes have transpired in 1914. Thousands of our Maritime Province boys are serving their King and Country at the front. Many homes are mourning the loss of dear ones who fell with their face to the foe and others who have passed to the great beyond from their peaceful homes. We miss those who are away for a time as well as those who are gone forever, yet we must all press on and let us hope and pray that victory will crown our banners ere many more months elapse.

* * *

Aaron Ernst, Blockhouse, Lunenburg, N.S., has sent to the Maritime Farmer for publication the weight of a hog butchered recently by Isaac Zwicker, of Blockhouse. The hog was 16 months old and tipped the scales at 695 pounds. He is out with the challenge: "Who can beat it?"

Come along, boys, let us hear from you. No fish stories. What has our friend, Harry Alliston, of York County, to boast about this year in the hog line. He usually grows a big one. It is hard to down Lunenburg County on pork, and cabbage growing.

* * *

On other pages of the Maritime Farmer our readers will find the advertisements of the Short Courses which will be held at the N. S. A. C., Truro, early in January. Also the Short Courses that will be carried on by the New Brunswick Department at Sussex. The courses at the Woodstock School will be announced later. A great many of our farm boys are away at the front—many of those attended the short courses in former years and, if home, would be there again this year. It is a duty incumbent on farmers and farmers' sons who have not enlisted for active defence, but who are doing all they can for the cause of production to attend one of the short courses. They will find the ideas taught at the various schools and colleges a great incentive to do better work and do it easier than ever before. Plan to attend the courses. You can if you only try. Send the boy anyhow and come yourself if you can.

Result of the 72 Hours Dairy Test at the 1915 Maritime Winter Fair.

Guernsey Herd Dispersal Sale.

On Thursday, January 6th, 1916, Hugh A. Dickson, of Dixieland Guernsey Farm, Central Onslow, N.S., is dispersing his splendid herd of Guernsey cattle by auction sale. Although Mr. Dickson has been in the business but a few years, he has worked into probably the best producing bunch of Guernseys in Canada, as well as being able to hold his own in the show ring as records at Halifax, Fredericton and Chatham this fall, will tell.

Gipsy of Willow (392) has qualified for A. R. three years consecutively, dropping four calves in 35½ months and making Canadian Guernsey record twice as three and four year old. Beauty's Bell made equally good records, but failed to calve in time to qualify according to regulations for Canadian R. of P. These two cows each made over six hundred lbs. butter in the year. They and ten of their offspring are included in the sale. A daughter of Gipsy of Willow, as three year old, made in three days, 7.5 lbs. fat, or practically 3 lbs. butter per day as three year old at Amherst, at the fair just over.

He is also selling five Yorkshire sows of J. W. Callbeck's breeding. They are in pig to the College Farm boar. They have all dropped one litter and are proven breeders. Also for sale five pure bred Percherons of excellent breeding. Two mares imported from France and their offspring. These mares are of excellent breeding and have won many first prizes at Halifax and Amherst Spring Horse Show.

This sale coming as it does at short course time and easily accessible from the College, offers a good opportunity for farmers to attend, killing two birds with one stone and taking advantage of the reduced rate. Mr. Dickson is donning the King's uniform, so sale is positive. Nine months' credit is offered; a 6% discount for cash.

Catalogues may be obtained by request.

How Records are Computed.

The standing of the respective cows is computed on the following scale: 25 points for each pound of fat; 3 points for each pound of solids not fat; 1 point for each ten days in milk after the first thirty days. Limit ten points.

The cows in the test were milked dry in the presence of the judges at 1 p.m. December 3rd, and the test was concluded at 1 p.m. on December 6th. the percentage of fat in the milk was determined by the Babcock milk tester and the percetnage of solids not fat. by the use of the authorized formula for the purpose.

No cow four years or over shall win first prize that does not produce at the rate of ten pounds of butter per week. or a second or any other prize that does not produce at the rate of 8 pounds of butter per week. No three year old cow shall win a first prize that does not produce at the rate of 9 pounds of butter per week, or a second or any other prize that does not produce at the rate of 7 pounds of butter per week. No heifer two years shall win a first prize that does not produce at the rate of 8 pounds of butter per week, or a second or any other prize that does not prduce at the rate of 6 pounds of butter per week. No heifer one year old shall win first prize that does not produce at the rate of 7 pounds of butter per week, or a second or any other prize that does not produce at the rate of 5 pounds of butter per week.

Prize Winners at the 1915 Maritime Winter Fair

BEEF CATTLE

Class 1—Shorthorns

Steer, 2 years old and under 3 years. 1, Forrest Bros., Amherst; 2, Hazen Etter, Westmorland Pt.

Steer 18 months and under 2 years. —1, Forrest Bros.; 2, Hazen Etter.

Steer 1 year and under 18 months—1, C. H. Angus, Port Howe; 2, Harold Etter, Westmorland Pt.

Steer, under 6 months—1, Geo. M. Holmes.

Cow or heifer 3 years or over.—1 and 5, R. A. Snowball, Chatham; 2, Harold Etter; 3 and 4, J. M. Laird & Son, Kelvin Grove, P.E.I.

Heifer, 2 years and under 3 years.—1 and 3, J. M. Laird & Son; 2, Harold Etter; 4, F. W. Sumner; 5, R. A. Snowball.

Heifer, 18 months and under 2 years. —1, 4 and 5, J. M. Laird & Son; 2 and 3, R. A. Snowball.

Heifer, 1 year old and under 18 months—1, Forrest Bros.; 2, Hazen Etter; 3, Harold Etter; 4, C. H. Angus; 5, H. P. Lawrence, Nappan Sta.

Heifer 6 months and under 1 year.—1, Harold Etter; 2, J. M. Laird & Son. 3, R. A. Snowball.

Heifer, under 6 months—1, Harry Carter, Point de Bute; 2, Harold Etter; 3, J. M. Laird & Son; 4, R. A. Snowball.

Sweepstakes, best animal, any age. —Harold Etter.

Class 2.

Donated by Canadian Shorthorn Breeders' Association.—1, Best pure-bred steer, any age, $10, Forrest Bros.; 2, Best pure-bred heifer, any age, $10, Harold Etter; 3, Best steer sired by Shorthorn bull, $10, Arthur Etter; 4, Best heifer sired by Shorthorn bull, $10, Forrest Bros.; 5, Best Shorthorn cow in dairy test, Walter Boomer.

Class 3.

Donated by M. J. O'Brien, railway contractor, Montreal, Silver Cup for best Shorthorn animal, any age. To be won three times, not necessarily consecutively, before becoming the property of the exhibitor. No animal can win more than one cup. Won in 1909 by C. A. Archibald. Won in 1910 by C. A. Archibald. Won in 1911 by Harold Etter. Won in 1912 by R. A. Snowball. Won in 1913 by Harold Etter. Won in 1914 by R. A. Snowball. Won in 1915 by Harold Etter.

Class 4.

Silver Trophy donated by R. A. Snowball, Chatham, N.B., to be won three times before becoming the property of the exhibitor for best four animals in Class 1, males or females, to be composed as follows: 6 months and under 1 year; 1 year and under 2; 2 years and under 3; and 3 years or over. Won in 1914 by Harold Etter. Won in 1915 by J. M. Laird & Son.

Class 5—Herefords & Aberdeen-Angus

Steer, 2 years and under 3.—1 Edward P. Anderson, Sackville.

Steer 18 months and under 2 years. —1, J. M. Laird & Son.

Steer 1 year and under 18 months.—2, Forrest Bros.

Steer 6 months and under 1 year.—1, Forrest Bros.; 2, Edward P. Anderson.

Steer under 6 months.—1 and 2, Forrest Bros; 3, Edward P. Anderson; 4, J. M. Laird & Son.

Cow or heifer 3 years or over—1, and 3, Forrest Bros.; 2 and 4, J. M. Laird & Son; 5, Wm. O'Brien & Son, Windsor Forks.

Heifer 2 years and under 3 years.—1 and 4, J. M. Laird & Son; 2 and 3, O'Brien & Son.

Heifer 18 months and under 2 years —1, J. M. Laird & Son.

Heifer, 1 year and under 18 months. —1 and 2, J. M. Laird & Son; 3, Wm. O'Brien & Son.

Heifer, 6 months and under 1 year.—1, J. M. Laird & Son; 2 and 3, Wm. O'Brien & Son.

Heifer under 6 months—1, 2 and 5, J. M. Laird & Son; 3 and 4, Wm. O'Brien & Son; 6, B. W. Ralston, Amherst; 7, Edward P. Anderson, Sackville.

Sweepstakes, best animal, any age.—E. P. Anderson.

Class 6—Grades of Any Breed

Steer, 3 years and upwards.—1, Forrest Bros.; 2, C. H. Angus; 4, Harry Carter, Point de Bute; 5 and 6, Wm. Holmes.

Steer, 2 years old and under 3 years. —1, Arthur Etter; 2, Forrest Bros.

Steer, 18 months and under 2 years. —2, Forrest Bros.

Steer 1 year and under 18 months.—1, Forrest Bros.; 2, J. M. Laird & Son; 3, Harold Etter; 4, Hazen Etter; 5, Harry Carter; 6, George B. Etter.

Steer 6 months and under 1 year.—1 and 2, Forrest Bros.; 3, Edward P. Anderson.

Steer under 6 months—1 and 4, Forrest Bros.; 2, Geo. A. Black; 3, Harold Etter; 5, C. H. Angus.

Cow, 3 years old and upwards—1, Forrest Bros.; 2, Wm. Holmes; 3, R. W. and O. A. Coates, Nappan; 4, Harold Etter; 5, B. W. Ralston; 6, Geo. B. Etter.

Heifer 2 years and under 3.—1, Forrest Bros; 2, Arthur Etter; 3, Geo. A. Black; 4, J. M. Laird; 5, Wm. O'Brien & Son; 6, R. W. and O. A. Coates; 7, Hazen Etter.

Heifer 18 months and under 2 years. —1, and 3, Forrest Bros.; 2, Hazen Etter; 4, Wm. O'Brien & Son; 5, Wm. Holmes; 6, Geo. B. Etter.

Heifer 1 year and under 18 months. —1 and 5, Forrest Bros; 2, J. M. Laird & Son; 3, Geo. A. Black; 4, R. W. and O. A. Coates; 6, Harry Carter.

Heifer 6 months and under 1 year.—1, Edward P. Anderson; 2 and 3, Forrest Bros.; 4, R. W. and O. A. Coates; 5, Hazen Etter; 6, Geo. B. Etter.

Heifer under 6 months.—1, Arthur Etter; 2, Forrest Bros; 3 and 5, Wm. O'Brien & Son; 4, Edward P. Anderson; 6, Forrest Bros.

Sweepstakes, best animal, any age.—Forrest Bros.

Class 7.

Dressed Beef Carcases—1 and 2, Forrest Bros.; 3, Wm. Holmes.

Class 8.

Silver Cup donated by W. W. Black for the best animal any age in Class 6 to be won three times, not necessarily consecutively, before becoming the property of the exhibitor. No animal shall win more than one cup. Won in 1911 by Edward P. Anderson. Won in 1912 by Fowler Bros. Won in 1913 by Edward P. Anderson. Won in 1914 by Forrest Bros. Won in 1915 by Forrest Bros.

Class 8A.

Donated by the Massey-Harris Co., Torotno. A plow for the best four animals in Class 6, male or female, comopsed as follows: 6 months and under 1 year; 1 year and under 2; 2 years and under 3; 3 years or over.—Forrest Bros.

Class 9.

Donated by International Harvester Co. of Canada, Ltd. For best beef animal any breed or grade. No. 55 Scuffler.—E. Anderson.

Class 10.

A special prize of $10 in gold for the best animal shown by a person who has not previously been an exhibitor of live stock at the Winter Fair, in classes 1, 5 and 6. No exhibitor can win in more than one class. Sec. 1—F. W. Sumner. Sec. 5—Wm. O'Brien & Son; Sec. 6—R. W. & O. A. Coates.

BREEDING CLASSES

Class 17—Ayrshires.

Heifer 18 months—1, Prescott Blanchard, Truro; 2, McIntyre Bros., Sussex; 3 and 4, A. McRae & Son, Charlottetown.

Heifer 1 year—1, McIntyre Bros.; 2 and 4, Fred S. Black, Amherst; 3, A. McRae & Son.

Best animal, any age—1, Prescott Blanchard.

Class 18—Holsteins

Heifer 18 months—1, Lea & lCark, Victoria, P.E.I.; 2, Logan Bros.; 3, Fowler Bros.; 4, S. Dickie & Son, Onslow.

Heifer 1 year—1 and 3, Logan Bros., Amherst; 2, Lea & Clark; 4, S. Dickie & Sons.

Heifer 6 months—1, Fowler Bros.; 2, S. Dickie & Sons; 3, Lea & Clark; 4, Logan Bros.

Best animal, any age—Lea & Clark.

Class 19—Jerseys

Heifer 18 months—1, 2, 3 and 4, H. S. Pipes & Son, Amherst.

Heifer 1 year—1, 2 and 3, H. S. Pipes & Son; 4, Jas. E. Baker & Son, Barronsfield.

Heifer, 6 months—1 and 2, H. S. Pipes & Son.

Best animal, any age—H. S. Pipes & Son.

Class 20—Guernseys

Heifer 18 months—1 and 2, Roper Bros., Charlottetown; 3, D. G. McKay & Son, Scotsburn; 4, Frank Roper; 5, R. R. Black, Amherst.

Heifer, 1 year—1, D. G. McKay & Son, Scotsburn; 2, Frank Roper; 3, Roper Bros.; 4, D. G. McKay & Son; 5, Hugh A. Dickson, Onslow.

Heifer 6 months—1, Roper Bros.,; 2 and 3, D. G. McKay & Son.

Best animal, any age—Roper Bros.

Class 21—Grades

Heifer 18 monts—1, Fowler Bros.; 2 and 3, R. R. Black; 4, Chas. Etter.

Heifer 1 year—1 and 2, Fowler Bros.; 3, T. W. Keilor, Amherst; 4, Geo. M. Holmes, Amherst.

Heifer, 6 months—1, Chas. Etter; 2, Geo. M. Holmes; 3, Fowler Bros.; 4, T. W. Keilor.

Best animal any age—Fowler Bros.

SHEEP

Leicesters

Ewe, 2 years old or over.—1 and 2, A. Boswall, Sr. Pownal, P.E.I.; 3, John Retson, Truro; 4, Samuel Lane, Pownal.

Ewe, 1 year old and under 2 years—1, 2 and 4, A. Boswall; 3, Samuel Lane.

Ewe lamb—1, 2 and 4, A. Boswall; 3, Samuel Lane.

Yearling wether—1, 3 and 4, A. Boswall; 2, Samuel Lane.

Wether lamb—1, 3 and 4, Samuel Lane; 2, A. Boswall.

Lincolns

Ewe, 2 years old or over—1, Albert Boswall, French Fort; 2 and 3, Ernest Lund, Mt. Hebert, P. E. I.; 4, C. D. Pugsley, River Hebert.

Ewe, 1 year old.—1 and 3, Albert Boswall; 2, C. D. Pugsley; 4, Ernest Lund.

Ewe lamb—1, C. D. Pugsley; 2, 3 and 4, A. Boswall.

Yearling wether—1, C. D. Pugsley; 2, A. Boswall.

Cotswolds

Ewe, 2 years old or over—1 and 3, Chas. Symes, Minudie; 2 and 4, John Tweedy, Ernscliffe, P.E.I.

Ewe, 1 year old and under 2 years—1 and 2, Chas. Symes; 3 and 4, John Tweedy.

Ewe lamb—1, 3 and 4, John Tweedy, 2, Chas. Symes.

Yearling wether—1. John Tweedy.

Cheviots

Ewe, 2 years old or over—1 and 4, Cephas Nunn, Winsloe Road, P.E.I.; 2 and 3, Chas. Symes.

Ewe, 1 year old—1, 2 and 4, Chas. Symes; 3, Cephas Nunn.

Ewe lamb—1 and 2, Cephas Nunn; 3 and 4, Chas. Symes.

Horned Dorsets

Ewe, 2 years old or over—1, 2 and 3, Geo. Boswall, French Fort.

Ewe, 1 year old—1 and 2, Geo. Boswall.

Ewe lamb—1, 2, 3 and 4, Geo. Boswall.

Yearling wether—1, Geo. Boswall.

Southdowns

Ewe, 2 years old or over.—1 and 3, Jas. E. Baker & Sons, Barronsfield; 2 and 4, Oliver Saunders, Winsloe, P.E.I.

Ewe, 1 year and under 2 years.—1 and 3, J. E. Baker & Sons; 2, E. Saunders, Winsloe Road; 4, Oliver Saunders.

Ewe lamb—1 and 3, J. E. Baker & Sous; 2, E. Saunders; 4, Oliver Saunders.

Yearling Wether—1 and 2, Oliver Saunders.

Wether lamb—1, 2 and 4, J. E. Baker & Sons; 3, Oliver Saunders.

Shropshires

Ewe, 2 years old or over—1, Jas. I. Stewart, Amherst Pt.; 2, 3 and 4, Geo. Boswall.

Ewe, 1 year and under 2 years.—1, 2, and 3, Jas. I. Stewart; 4, Geo. Boswall.

Ewe lamb—1 and 4, Geo. Boswall; 2 and 3, Jas. I. Stewart.

Yearling wether—1, Jas. I. Stewart.

Wether lamb—1, 2 and 3, Jas. I. Stewart.

Oxfords

Ewe, 2 years old or over—1 and 4, J. E. Baker & Sons; 2, J. M. Laird & Son; 3, Burder Goodwin.

Ewe, 1 year and under 2 years.—1 and 4, J. E. Baker; 2, J. M. Laird & Son; 3, Burder Goodwin.

Wether lamb—1, Burder Goodwin.

Hampshires

Ewe, 2 years old or over—1, 2, 3 and 4, Cephas Nunn.

Ewe, 1 year and under 2 years.—1 and 4, Cephas Nunn; 2 and 3, Almon Boswall.

Ewe lamb—1, 2, 3 and 4, Cephas Nunn.

Yearling wether—1, Almon Boswall; 2, Cephas Nunn.

Wether lamb—1, Cephas Nunn.

Suffolks

Ewe, 2 years old or over.—1, 2 and 4, Albert Boswall, French Fort; 3, Almon Boswall.

Ewe, 1 year and under 2 years.—1 and 2, Almon Boswall; 3, Almon Boswall; 4, Parker Horne, Winsloe.

Ewe lamb—1, 2 and 3, Albert Boswall; 4, Almon Boswall.

Grades or Crosses

Ewe, 2 years old or over.—1, Jas. I. Stewart; 2, Burder Goodwin; 3, Geo. Boswall; 4, Oliver Saunders; 5, E. Saunders; 6, Ernest Laird.

Ewe, 1 year old—1 and 2, Jas. I. Stewart; 3, C. D. Pugsley; 4, E. Saunders; 5, Oliver Saunders; 6, Samuel Lane.

Ewe lamb—1 and 3, Jas. I. Stewart; 2 and 4, Cephas Nunn; 5, Jas. E. Baker & Sons.

Yearling wether—1, Almon Boswall; 2, Oliver Saunders; 3 and 4, A. Boswall Sr.; 5, Samuel Lane.

Wether lamb—1, Jas. I. Stewart; 2, Cephas Nunn; 3, Oliver Saunders; 4, Samuel Lane.

Best animal shown by a person who never previously won a prize at the Winter Fair.—1, Parker Horne; 2, E. Saunders; 3, Ernest Lund.

Dressed Sheep Carcases

Best carcass mutton—1, J. E. Baker & Sons; 2 and 3, Oliver Saunders; 4, Jas. I. Stewart; 5, Cephas Nunn; 6, Samuel Lane.

Best carcass lamb—1 and 4, J. E. Baker & Sons; 2, Oliver Saunders; 3 and 5, Jas. I. Stewart; 6, Cephas Nunn.

Bank of Montreal special for the best four lambs, all of one breed, pure bred—1, Burder Goodwin; 2, Jas. I. Stewart.

Bank of Commerce special for the best three shearling wethers.—1. Oliver Saunders; 2, A. Boswall Sr.

Best pen wether lambs—1, Forty rods wire fence donated by The N. B. Wire Fence Co., Moncton, N.B., Jas. I. Stewart; 2, $10.00 donated by Amherst Hotel, Amherst, Jas. E. Baker & Son; 3, $6.00 donated by the Maritime Farmer, Oliver Saunders; 4, $4.00 donated by the Maritime Farmer, Samuel Lane.

Best pen 1 lamb, yearling and two year old, Royal Bank special—1, Jas. I. Stewart; 2, Jas. E. Baker & Sons.

WOOL PRIZES

Long Wool Lamb (Hogg) Fleece—1, Samuel Lane; 2, Albert Boswall.

Long wool sheep (wether) fleece—1, Samuel Lane; 2, H. Boswall Sr.

Medium wool lamb (Hogg) fleece—1, Albert Boswall; 2, Jas. E. Baker & Sons.

Medium wool sheep (wether) fleece—1 and 2, E. J. Vesey.

Championship

Long wool fleece—1, Samuel Lane.

Medium wool fleece—1, E. J. Vesey.

SWINE

Yorkshires

Barrow, under 6 months—1, J. W. Callbeck, Summerside, P. E. I.

Sow, 9 months and under 15 months.—1 J. W. Callbeck; 2, Chas. Etter.

Sow, 6 months and under 9 months.—1 and 2, J. W. Callbeck; 3, Chas. Etter.

Sow, under 6 months.—1 and 2, J. W. Callbeck.

Tamworths

Barrow, 6 months and under 9 months—1, 2 and 3, Fowler Bros.; 4 and 5, A. McRae & Sons.

Barrow, under 6 months—1, 2 and 3, Fowler Bros.

Sow, 6 months and under 9 months.—1, Fowler Bros.; 2 and 3, A. McRae & Sons.

Sow, under 6 months—1 and 2, Fowler.

Berkshires

Barrow, 6 months and under 9 months—1, 2, and 3, Fowler Bros.; 4, Jas. I. Stewart; 5, J. R. Simple.

Barrow, under 6 months—1, 2 and 5. Fowler Bros; 3 and 4, Harry Carter.

Sow, 9 months and under 15 months.—1, Peter Brodie, Little York, P.E.I.; 2, J| R. Semple; 3, Jas. I. Stewart.

Sow, 6 months and under 9 months.—1, Peter Brodie; 2, J. I. Stewart; 3, Saxby Semple, Tatamagouche, 4, Fowler Bros.; 5, Samuel Lane.

Sow, under 6 months.—1, Fowler Bros.; 2, Peter Brodie; 3, Saxby Semple; 4, J. R. Semple.

Any Other Variety

Barrow, 6 months and under 9 months—1, 2 and 3, A. H. Boswall.

Barrow, under 6 months.—1 and 2, A. H. Boswall.

Sow, 6 months and under 9 months.—1 and 3, A. H. Boswall; 2, Wallace stead.

Sow, under 6 months.—1, 2 and 3, A. H. Boswall.

Grades of Any Breed

Barrow, 6 months and under 9 months—1, W. N. Boomer; 2, Forrest Bros.; 3, Peter Brodie.

Barrow, under 6 months.—1, Forrest Bros.; 2, W. H. Pope Cook.

Sow, 9 months and under 15 months.—1, Geo. A. Caulback.

HORTICULTURE.

Growing Potatoes without Potash.

Potatoes are the chief cash crop grown in Maine and the adjoining counties of New Brunswick. It is of first importance for the grower to have what facts are available relative to the likelihood of obtaining a crop in 1916 without the application of potash. Foreseeing the possibility that the fertilizers of 1916 would contain very little, if any, potash, the Maine Agricultural Experiment Station began in 1915 at Aroostook Farm a series of experiments to determine the effect of different amounts of potash. Four different mixtures were used. In each case the fertilizers contained 4 per cent of nitrogen (5 per cent of amomnia), of which one-third was in the form of nitrate of soda, and 8 per cent of available phosphoric acid. The potash varied as follows: On one plot there was none, on another 2 per cent, on another 5 per cent, and on another 8 per cent. The plots were one-half acre each and they were planted in duplicate. The land had been in grass for two years, one year in oats, and the year before that had been in potatoes. No fertilizer had been used since the potato crop of 1911. In each case the fertilizer was applied at the time of planting, at the rate of 1500 pounds per acre. Other than the amount of potash used, all the plots were treated exactly alike.

Throughout the growing season the vines on both the no-potash plots were a distinctly brighter green and had a thriftier look than on the adjoining plots. The difference was so marked that it attracted much attention from visitors at the farm. Although some slight irregularities occurred in the yield from the different plots, the average figures show fairly consistent increases with the increase in potash. The plots without potash yielded 110 barrels, of 302 bushels of merchantable potatoes. The plots with 2 and 5 per cent. potash gave practically the same yields of 116 barrels, or 320 bushels per acre. The 8 per cent potash plots averaged to yield 120 barrels, or 331 bushels per acre. This is an increase of 10 barrels from the 8 per cent plots over the no-potash plots. This amount is undoubtedly large enough to be significant, and to indicate that the potash increases the yield of potatoes in Aroostook county. On the other hand, 110 barrels (302 bushels) per acre is a good yield—considerably above the average, and nearly double the average in the county in 1915. So far as the results of this one year are concerned, they indicate that a profitable yield of potatoes can be obtained on Aroostook soils without the addition of potash for at least one year. In a few farmers' trials made by the various fertilizer companies, in which no exact records were made, satisfactory results were obtained without the use of potash by all of the growers from whom the station has heard. Quite a number of farmers tested mixtures cotnaining varying amounts of nitrogen, phosphoric acid and without potash. The concensus of opinion seems to be that a 5 per cent ammonia and 10 per cent. phosphoric acid gave, on the whole, the best yields. Based upon the reports of these trials, a good many of the fertilizer companies are increasing the amount of phosphoric acid the present year. Fertilizers that normally carried 8 per cent will in 1916 carry 10 per cent. available phosphoric acid. To the writer, this increase in phosphoric acid does not seem to be necessary. Outside of the special fertilizer experimental plots at Aroostook Farm and at Highmoor Farm, the fertilizer to be used in 1916 will carry 5 per cent ammonia (with one-third of the nitrogen in the form of nitrate of soda), 8 per cent available phosphoric acid, and no potash.

Experiments at Massachusetts, however, indicate that available phosphoric acid hastens the development of the plants at the beginning of the season, and that would seem to be borne out

KING COLE TEA

Superlative Quality

plus the money-back guarantee

WHEN KING COLE TEA first issued its protective guarantee to the purchaser, three years ago, offering to refund the whole of the purchase money for any package of KING COLE returned, there was a very good reason for this radical departure from usual sales methods.

We greatly desired a very general trial of KING COLE TEA. Our **faith** in its quality was unbounded, for **we knew** the constant care given to its preparation, but we realized the possible doubt the public might have of a TEA then comparatively new, and so we decided to assume the risk of every trial, and pay back the full purchase price of every package of KING COLE that failed to please. No stronger surety of our good faith could be offered, and we felt confident because of the quality of KING COLE TEA that practically every trial would bring us a permanent customer.

Things have turned out just as we expected. Not one package has been returned. We have never had a request for "Money Back"—we have never heard of a complaint of "King Cole" quality, while "King Cole" sales have been growing steadily larger year by year.

Only exceptional quality could have made such a record, and to-day with more confidence than ever, we invite you to give this tea a test.

The "Money Back" offer is still open; every package is sold on that understanding. What better assurance of Tea value could you have, and what better encouragement to buy your first package of KING COLE TEA?

Worms are Enemies of Children

Worms are one of the most dreaded diseases of children. There is nothing better than Dr. True's Elixir to expel worms of all kinds and to keep the stomach in good order. First manufactured by my father in 1851. Our mothers and grandmothers used this remedy and found it to be ideal for its purpose.

Trade Mark

Some of the signs of worms are: Deranged stomach, furred tongue, belching, variable appetite, increased thirst, acid or heavy breath, nausea, enlarged abdomen, variable bowel action, pale face of leaden tint, bluish rings around eyes, itching of nostrils, languor, irritability, disturbed sleep, grinding of teeth, irregularity of pulse.

If your child is not one of the robust kind, start in to use Dr. True's Elixir, the Family Laxative and Worm Expeller, today. 35c, 50c and $1.00. Advice free. Write me.

Knowlton, Que. Dr. True

by the farmers' expericences cited above where they had compared 10 per cent available phosphoric acid against 8 per cent available phosphoric acid. The fertilizer companies state that the difference in cost between a fertilizer carrying 8 per cent and one carrying 10 per cent available phosphoric acid in 1916 will not exceed $1 per ton. It may be that this added phosphoric acid may be found profitable. Based on the 1915 results at Aroostook Farm, it would not pay any man to buy potash at the present price of $5 per unit, even if it could be obtained. The increase of 10 barrels of potatoes per acre where 8 per cent of potash was used, over where none was used, was worth at harvest about $15. Eight per cent potash, if it could be had, would cost not less than $30 per acre for 1500 pounds of fertilizer, which is twice the value of the increased crop.

For potash liberators the evidence is preponderant in favor of nitrate of soda. There is little evidence that common salt frees any perceptible amount of potash which will become available to the potato crop. Gypsum (calcium sulphate) probably will help render the potash available. A fertilizer carrying 5 per cent of ammonia in which one-third of the pitrogen is in the form of nitrate of soda, and carrying 8 or 10 per cent of available phosphoric acid, will have, theoretically, enough sodium from the sodium nitrate and calcium from the calcium sulphate (gypsum), to liebrate enough potash for a maximum crop of potatoes.

The station, therefore, advises the use of 1500 to 2000 pounds of a fertilizer carrying 5 per cetn of ammonia with one-third of the nitrogen in the form of nitrate of soda, and 8 per cent. or even ten per cent. of availtble phosphoric acid and no potash for 1916. With people who have been getting good results from a fertilizer carrying 4 per cent of amomnia, a 4-10-0 fertilizer would probably prove satisfactory. —Chas. D. Woods, Director Maine Experiment Station, in Maine Farmer.

THE NOVA SCOTIA FRUIT GROWERS' ASSOCIATION WILL MEET IN THE TOWN OF WOLFVILLE ON JANUARY 18th and 20th. PLAN TO ATTEND.

A Progressive P. E. I. Institute.

Palmer Road Institute makes good again. Good breeding and loyal co-operation get the price. Last spring this institute sold the wool co-operatively and got for graded unwashed wool more per lb. than prices then being paid for washed wool.

This live and progressive institute has just sold 1220 lambs to the New England Meat & Wool Co., represented here by Mr. Church. Mr. J. J. McNally and Mr. Roy Silliphant, of Summerside, handled the lambs at the Palmer Road end and pleased everybody.

The institute leads again all other institutes in number sold, prices paid, and amount realized. All lambs 65 lbs and over, 7¼c; fat sheep, 5 cents. Amount realized, $7,215.83. Mr. Jas. Cadigan received $156.54 for lambs. Mrs. Joseph Dunbar's ewes netted him $14.12 in lamb flesh. Mr. Dennis O'Brien sold one lamb for $10.15 and his 17 heads averaged 104 lbs. of $7.45 per single lamb of $15.08 for twins. Mr. Jos. Poirier's lambs also averaged 104 lbs. Mr. Charles Pridham received $20.44 for the lambs of one ewe. Mr. James Gillis received $9.95 for a fat ewe. The Palmer Road Institute bought two weeks ago 12 pure bred Shropshire rams—9 beauties from Mr. Archibald, Truro, N.S., a real good one from Mr. L. H. D. Foster, York, and two from Mr. C. B. Clay, Bridgetown. Another progressive move inaugurated by this institute is the shearing and dipping of the flocks co-operatively. They have already ordered up-to-date clippers for next spering and a couple of men will do the shearing and dipping, besides packing the fleeces in proper shape for grading.

Fifteenth Annual Maritime Winter Fair.

(Continued from Page 187)

On Tuesday evening lectures were delivered in the two lecture rooms.

In Lecture Room No. 1 S. A. Logan acted as chairman and an appreciative audience listened with keen attention to J. H. Grisdale, Director of Experimental Farms, Ottawa, on the subject of "Crop Production in the Maritime Provinces from Live Stock Standpoint,"" and to W. W. Baird, Superintendent of the Experimental Farm, Nappan, on "Opportunities for Beef Production."

In Lecture Room No. 2, A. E. Trites, Salisbury, was chairman and another interested audience listened to an address by W. F. Stephen, Secretary of the Canadian Ayrshire Breeders' Association, on "Cleanliness in the Milk Supply," the substance of which will be found on the Dairy pages of this issue.

Prof. M. Cumming followed with an interesting heart to heart talk on "Some Fertilizer Problems, with Special Reference to the Use of Limestone and Substitutes for Potash." Extracts from his address will be published in the next issue of the Maritime Farmer.

On Wednesday Evening

Hon. M. McKinnon was chairman in Lecture Room No. 1 where an excellent address on "Care and Management of the Dairy Herd," was delivered by E. S. Archibald, Dominion Animal Husbandman. It is needless to say that, as in the past, Prof. Archibald was listened to with keen interest. Prof. Archibald has the confidence of the farmers of the Maritime Provinces and is always sure of a hearty welcome. Our people here have known him since his boyhood. They have followed him in his college career and are proud of his achievements in his work at the N.S.A.C., and although loath to see him leave the Maritime Provinces they were glad when the call came to fill a position where his influence will have a wider sphere of action.

W. W. Hubbard was chairman in Lecture Room No. 2 and Prof. J. M. Trueman, of the N. S. A. C., talked to an appreciative audience on "How Can We Improve our Live Stock with Least Expense and in Shortest Time." Prof. Trueman has had a wide practical experience along this line and no one in Maritime Canada is better qualified to talk on the subject. Sound business principles and profitable returns in dollars and cents underlie the various ideas presented in the discourse. Extracts from this address willbe published in next issue.

Thursday Evening,

the closing evening of the fair, found the audience in the main auditorium with Rev. P. C. Gauthier in a happy mood, dispensing good cheer and presenting to the successful exhibitors the trophies they had won.

There was one function on Wednesday evening that was not on the programme, viz., an impromptu exhibitors' banquet, where, over steaming bowls of cham chowder not a few of the stockmen and judges waxed eloquent. When we last saw J. M. Laird, John Bennett, Jack O'Brien and Judge Fred Cromwell would hold their sides and tears of merriment wolud bedim their eyes when they recalled the witty speeches of the banqueters.

DAIRYING.

Cleanliness in the Milk Supply.

(Address delivered by W. F. Stephen, Huntingdon, Que., Secretary of the Montreal Milk Shippers' Association at the Winter Fair, Amherst, N.S., on Tuesday, December 7th, 1915.)

Fellow Farmers and Dairymen:

A few years ago at the Guelph Winter Fair, a speaker treated, very ably, a subject similar to this. In the outset of his address he referred to the "ideal" and the "real," and while we seldom attained to our "ideal" yet our aim should be to get very near to it. I consider it of foremost importance that we should have an "ideal" in every sphere of life and in attaining to reach that goal we undoubtedly reach a higher plane than if we had no standard before us. Again I believe every community should do all in its power to encourage those who are striving to reach an "ideal," because such ideals always serve to show those less energetic, less enthusiastic, what may be done by those who try. Therefore, every means for supplying the highest "ideal" in the line of producing a high-grade milk and cream should be appreciated by dairymen, factoryman and milkman, and their continuation should be vigorously encouraged by all friends of our great dairy industry. But alas, too frequently we find dairymen at issue with every measure brought forth to better the milk supply. I ask why is this? Is our milk supply, as regards quality, in keeping with the advanced times? I fear not.

Milk, that most palatable, wholesome, nutritious, perfect yet inexpensive diet, it, and its products now so largely consumed by all civilized nations. Is it being produced under the most cleanly and sanitary methods? I fear not. Then, if not, why? Is it through ignorance of its composition, of its susceptibility to contamination, by those engaged in producing it? Is it because of carelessness on the part of the producers, or is it because the dairyman is not sufficiently remunerated for his labors? Possibly all three causes have a part to play in hindering the production of clean, sanitary milk.

Clean Milk—What does this mean? Is not all milk clean milk? It may have been but does not always remain so. I take it, clean milk, is milk taken from healthy cows under the most cleanly conditions to which nothing has been added nor from which anything has been taken away. Such milk contains a comparatively small number of bacteria and if cared for and kept under the most favorable conditions will always be clean milk. But unfortunately, herein is where the trouble begins, as almost as soon as milk is drawn from the cow it becomes a subject of contamination.

I am quite convinced that in the early days of the dairy industry when the work of milking the cows and caring for the milk was all done by women, that a more cleanly product was the outcome, than when this became largely the work of our men, who are not, as a rule, so ready to observe the essentials in cleanliness as are our women, with the result, that as time advanced and fewer women assisted in our farm dairies, undoubtedly there went out to the cheesery and creamery a milk higher in bacterial count.

"Bacteria," we find this mysterious word so frequently associated with milk and its products that we gaze on it with alarm, but as we look at it we find nothing to alarm us further than it has opened up a new field for study, a field unknown to our forebears. To the much ridiculed "scientist" and his wonderful microscope, together with his laboratory work is this revelation due. Bacteria, I will not discuss it, for I am not a bacteriologist, but, we are informed by the highest authorities in that realm, thta from the time the milk is drawn from the cow it is in danger of infection from some species of bacteria which are constantly present in dusty, impure air, in bad water, or unclean utensils, on the hands and clothing of the attendants and milkers, and practically everywhere. Even in pure air certain forms of bacteria that have the power of souring milk are present. Such being the case, it is up to the dairyman to minimize in every way possible the source of contamiantion.

Milk is the most common and most extensively used liquid food of civilized nations. It is consumed by the infant, the invalid, the adult and the aged. In the household economy it takes a prominent place, and is used in the makeup of many wholesome and palatable dishes. Manufactured into butter or cheese its consumption is immense and ever on the increase, while the demand for condensed milk from steamships destined for long voyages, mining and construction camps, in those countries where raw milk cannot be produced advatnageously, and even in our large cities, increases, as its merits become known. Therefore when milk enters so fully into the dietry of our people, why should it not be clean and pure, instead of being contaminated with helath destroying germs, which only get there because of the indifference of the producer, manufacturer or dealer.

Milk Must Receive Special Care

Every up-to-date dairyman and manufacturer knows that the flavor, aroma, texture and keeping qualities of butter are affected by the quality of the milk and cream; that gassy curd in cheesemaking is due to bad milk; that in the condensary no milk is accepted in which there is an undue per cent of acid or milk that is off flavor. In the manufacture of these products alone there is an inestimable loss each year to our dairymen through bad milk, entering itno our products, thus causing a lower grade product to be put upon the market and selling for a lesser price.

I would not have you infer that I assume that all milk produced is unclean milk, nay, far from it, but I do hold that a considerable percentage of the milk delivered to our cheeseries and creameries is not the high class product we would expect from our dairymen in this progressive age. From an exchange I take the following:

"In a recent number of a Bulletin issued by the Chicago School of Sanitary Instruction an inspector describes a certain farm where the barn was well built with high ceilings, plenty of windows, and a cement floor. It was newly whitewashed. The milk house was clean and the milk cans stood in cold running water but the milkers themselves were very dirty and wore dirty clothes. The backs of their hands were covered with dirt but the palms were immaculate, the dirt on them had been washed off by the milk. The milk stools were so dirty that a quarter of a pound of dirt was scraped off the legs of one of them. The milker who was using it said he had never cleaned up before milking or washed his hands before or during the operation, nor had he ever sopnged off the cows' flanks or udders."

Knowing something of the conditions and habits of our dairymen, I am free to say, while this appears overdrawn, yet, on a milder scale, it is simply an illustration of a too-common occurrence on many dairy farms today. The remedy is simple and lies with the dairyman, simply, clean-up and keep clean.

All I have said re production of milk for the cheesery, creamery or condensary, applies to the production of "market" or "commercial" milk, as it is frequently called. Yea, a higher class milk should be suplied for food as the raw milk enters largely into the dietry of infants, children and invalids and customers expect it to be clean and wholesome. Owing to the length of time from 12 to 48 hours between milking and the time it reaches the consumer, there is a great liklihood of its becoming contaminated, it may be clean and pure when it leaves the farm, but in transit, in the vendors' hands and even in the home of the consumer there may be sources of contamination with which it comes in contact that practically unfits it for food.

The demand for clean milk is growing more intense all the time. It may be the buyer is getting as good milk as he pays for. "Certified" milk is the cleanest milk that is on the market: but the cost of production is so great and the sale so limited that it is placed beyond the power of the ordinary dairyman to make it at a profit.

The "pasteurization" of milk for household use is becoming more popular, although the heating of the milk to a temperature of 176 degrees F. somewhat destroys its flavor and makes it a little hard to digest, yet it is safer as a food. It can only be carried on satisfactorily by those firms with large plants.

The "pasteurization" of cream for butter making, as practised in Denmark, may be effectual in counteracting any ill effects from unclean milk, resulting in producing a superior quality of butter.

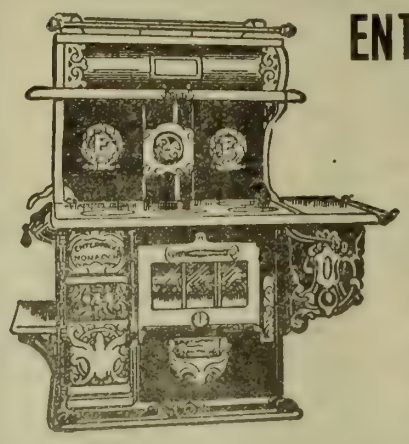
No dairyman willingly produces unclean milk, but to my mind there are three causes why unclean milk is being produced.

1st—Because of force of habit, (following in the customs of our forebears.) 2nd—Ignorance and indifference to sanitary methods and laws. 3rd—Carelessness on the part of the producers, makers and dealers, in not observing cleanly methods in handling milk. This latter should be considered a crime against society.

Where does the remedy lie? I answer in one word,—Education, to use this word in its broadest sense. It means that much missionary work must be done among the indifferent and careless dairymen before we reach our "Ideal." This missionary work must be educative by giving publicity (through the press and platform) to the evils resulting from unwholesome and unclean milk, the necessity of pure milk, the advantages of pure milk, and the methods to be pursued in order to attain the end sought. This is quite essential in paving the way for the

DO YOU WANT A NEW RANGE?

If you do it will pay you to investigate the



ENTERPRISE MONARCH STEEL RANGE

It is no light "mail order" stove, but substantially built, high grate one that will stand the wear and tear of years of use.

With small fuel consumption it bakes perfectly at all times. It is easy to operate for there are no complicated dampers.

Burns wood or coal. Has ample provision for continuous hot water.

And is moderate in price, costing less than lots of inferior ranges.

second means which must be authorative and consist in legislative and municipal regulations o govern the milk supply whether produced for the manufacture of butter, cheese, condensed or comercial milk.

The public are clamoring for protection, and are entitled to protection from that which is not conducive to their highest interests. In this respect they apepal to the higher authorities with a measure of success. Today we find nearly all our large cities formulating rules to govern the production, transportation and sale of milk, with a view to improvement, and where these regulations have been reasonable and carried out by capable inspectors the milk supply has been improved in a great measure.

These regulations usually demand that milk be produced from healthy cows, housed in clean, well-lighted, well-ventilated stables, fed wholesome food and p lenty of pure water, the cows kept clean and milked in a cleanly way, the milk taken to the dairy room immediately on being drawn from the cow, areated and cooled to at least 50 degrees F., all utensils coming in contact with the milk kept thoroughly clean, and the milk delivered at the station or factory in the best condition possible.

To meet moderate regulations of the above nature does not require so much of an outlay of capital and labor on the part of the dairyman as we would at first supose, only he may require to put in more windows, install some system of ventilation, do some whitewashing and make a general clean up all round both in stables and barnyard. I know of some very ordinary stables that have been erected some years in which high class milk is being produced by observing these simple rules.

To carry out city regulations one or more inspectors are necessary to occasionally visit the farm dairy to see if the producers is meeting the requirements laid down by the Board of Health, or other authority. These inspectors can do good work if not too officious and are men who understand the conditions under which milk is produced.

The inspector should never allow the producer to feel that he has visited him in the capacity of a spy or a policeman. Our dairymen wil resist the "big stick" every time. The idea of mutual helpfulness should always be encouraged. If the producer can be shown how to produce more milk for less money (which in many instances may be done) all the better; but at least, he should never be left until the inspector feels that he will be glad to see him upon his next visit; unless sure that he is a hopeless case.

Along this line a writer has said: "Do not expect to get everything at once; remember that the farmer is following the habits of a lifetime and perhaps of many of his ancestors and will have to be shown most tactfully. Show him that his stable and milkroom are kitchens in which he is preparing food ready for the stomachs of infants and invalids; you will then be in a better position to ask him to keep them clean at the time of milking and handling the milk."

I like the sentiment of the above lines from the pen of Dr. Santee, medical expert in charge of market milk investigations for New York state Department of Health. He further says along this line:

"The Board of Health that does not cause a systematic inspection of the dairy farms furnishing milk to its people is falling far short of its whole duty to the babes whose fate may be at its mercy. Experience has shown that to improve a milk supply by regulations alone is a very slow process. Better a campaign of education all along the line from the producer to the consumer. The happiest results follow a well managed conference between health authorities, consumers

Administering Medicine to Pigs.

A very successful method is to combine the medicine with the food. This is excellent in minor ailments when medicine is least required, but is practically useless in those cases when it becomes really desirable or necessary. A pig with a skin irritation or eruption that harbors worms, or suffers from some comparatively unimportant ailment which does not affect his appetite, will greedily eat with his food drugs that are not intolerably nasty, and he has no objection to the flavor of salines, like nitrate of potash, Epsom salts, Galuben salts, etc. There are occasions when the nature of the case and the character of the remedies demand administration in a fluid form, but wherever possible medicine should always be given to pigs in the shape of an electuary or paste, and generally a judicious selection of remedies will permit of this method of medication being adopted. There are few drugs required in the medication of the pig that do not lend themselves fairly well to administration in the form of an electuary.

The Electuary

The electuary form of medication possesses the further advantage that in cases of sore throat and cough associated wtih laryngeal irritation, the medicine exercises a local action, and such agents as the nitrate and chlorate of potash, bella donna, and demulcent or soothing remedies may do good in this way. Small quantities of fluid can also be mixed with powders and then made into a paste with treacle. There is one advantage in administering medicines to the pig—he needs no pressure, force or persausion to make him open his mouth. When the mouth is opened in spealing the electuary-laden spatula can be thrust in.

Drenching

Where fluid medication or drenching is considered a necessity the quantity should always be as small as is consistent with the proper dilution of the active drugs; and to reduce the action of irritant agents, such, for example, as turpentine given to expel worms, it is best to employ oil, milk, or demulcent gruel as a vehicle, in preference to water. In drenching a powerful pig, especially if any quantity of fluid has to be administered, it is a good plan to use as a funnel an old boot with the toe cut off. When the pig opens his mouth to protest, as he is certain to do, the boot should be thrust in and the medicine poured into it from a long-necked bottle. There is much less risk of choking than if the fluid is poured directly into the mouth from bottle or horn. Young pigs are best held for medication by an assistant, who should bestride the animal, gripping the shoulders with the knees or calves and keeping the head steady by holding an ear firmly in each hand, while the principal attends to the administration of the medicine. For a fierce old boar or strong and intractable old sow the best method of securing is a strong cord, furnished with a running noose, passed around the snout, behind the tusks. By this the animal can be drawn up to a ring or post and secured as for ringing or other minor operation. There are special appliances for catching pigs, and for holding them securely when caught, but they are not likely to be found, because not often required, on the farm or premises of the average pig-keeper.—Veteran.

W. Clark & Son's New Herd Header.

The Editor, Maritime Farmer,
Sussex, N.B.:
Dear Sir,—

It may be of interest to your Prince Edward Island readers to note the following:

A son of the great Jersey heifer, "Brampton Oakland's Trial" (imp.) 1450, owned by the Central Experimental Farm, Ottawa, whose photo recently appeared in a copy of your paper, has recently gone to head the herd of Messrs. W. Clark & Sons, Maple Grove Farm, North Wiltshire, P.E.I. The calf was dropped on February 12, 1915, after the cow had completed an R. O. P. official senior 3-year-old record of 9,082 pounds of milk, 578 pounds of fat in 365 days, with an average butterfat test of 6.36 per cent. This cow made a stable record for her lactation period of 9,674 pounds of milk, 648.1 pounds of fat, average per cent fat 6.7, in 417 days. The sire of this young bull is the herd bull at the Central Experimental Farm, "Brampton Mon Plaisir"—1886,— a son of the famous cow "Aristocratic Fanny" (imp.) which cow has made several official records in Canada, the last one, recently completed, being 11,605 pounds of milk, 527 pounds of fat in 365 days, at 9 years of age.

Live stock breeders in the East are well acquainted with the herd of W. Clark & Sons and of the many splendid records, official and otherwise, which have been made in this herd.

Sincerely yours,
E. S. ARCHIBALD,
Dominion Animal Husbandman.

Pointers for Pig Keepers.

In making selection of a brood sow, choose one which has been thrifty and vigorous in growing. A large body, a deep chest, and strong legs are good points. Do not choose .out the best-lokoing pigs of the litter before they have been weaned, but when they have been weaned and fed for a month or so, then a sow from the litter which shows the greatest improvement will generally be the best for breeding purposes.

It is a bad practice to breed from immature sows. Boars and sows should not be used for breeding until at least eight or ten months old, and can be kept to advantage until they are six or seven years old, and a sow will give the best results from the time she is two years old, provided that she is kept in comfortable condition, and not abused in any way.

Some persons have a notion that the breeding sow should be kept thin or practically half-starved when carrying her young. This is a mistake, for there is no time in a sow's life when she more requires suitable food and good quarters than when she is carrying and nursing her young; she should be kept in fair condition of flesh, given plenty of exercise, with a dry pen and very little bedding.

If a sow has free acess to dry earth, it helps to keep her in good health, so that she will drop well-developed pigs. Never feed a sow heavily for three or four days after farrowing, because the young, not being very strong, do not require so much milk as they will in a few days; if fed heavily, she will make more milk than they can take, and an attack of milk fever or garget is not improbable.

When the pigs are a week old, the sow's daily ration may be increased. In the weaning of pigs the common practice is to let them run a month, but I think six or eight weeks far better. If too soon weaned they are liable to become stunted, and once this happens they never seem to recover what they have lost.

Pigs should never be given more food than they will eat up clean at one time. Some persons give more than this, thinking that, as the pigs will ultimately eat it up, nothing will be wasted; but even a pig will hardly relish the leavings from a previous meal as well as he will a fresh allowance, and the question of palatability is by no means an unimportant one in the profitable feeding of any animal.

Messrs. Lea & Clark, Victoria, P.E.I., butchered a pure bred Holstein male at 13 months of age that dressed 507 lbs. beef and brought $63.00 in cash returns. Good returns for baby beef. Eh, What

PEERLESS POULTRY FENCE
A Real Fence—Not Netting
Strongly made and closely spaced making it a complete barrier against large animals as well as small poultry. Top and bottom wires No. 9—intermediates No. 12 wire—made by the Open Hearth process which time and other tests have proven to be the best. Send for catalog. Ask about our farm and poultry fencing. Agents nearly everywhere. Agents wanted in unassigned territory.

COUGHED SO HARD

Would Turn Black In The Face.

SHE WAS CURED BY USING

DR. WOOD'S Norway Pine Syrup.

Mrs. Ernest Adams, Sault Ste. Marie, Ont., writes: "My little girl, six years old, had a dreadful hard cough. At nights she would cough so hard she would get black in the face, and would cough for several hours before she could stop. We tried different kinds of medicines and had several doctors, but failed to do her any good. She could not sleep nor eat her cough was so bad, and she was simply wasting away. A friend advised me to try Dr. Wood's Norway Pine Syrup. I got a bottle and saw an improvement, and got another. Now I am only too glad to recommend it to all mothers."

Too much stress cannot be laid on the fact that a cough or cold should be cured immediately.

Dr. Wood's Norway Pine Syrup will cure the cough or cold and prove a preventative from all throat and lung troubles such as bronchitis, pneumonia and consumption.

"Dr. Wood's" is put up in a yellow wrapper; three pine trees the trade mark; price 25c and 50c, per bottle.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

The Nova Scotia Carriage Company's Carriages and Sleighs.

Synonyms of Quality, Durability and Finish.

That Maritime Province brains, industry and capital can successfully hold their own against the best that Canada can offer in the way of competition, is being pretty satisfatcorily demonstrated by the Nova Scotia Carriage Company, of Amherst.

That this concern was able in 1915 to increase its business twenty-five per cent and has every prospect of piling an even larger increase on top of that in 1916, speaks volumes for the enterprise of that live wire, Mr. W. L. Baker, general manager of the company.

Mr. Baker has been at the helm for two years. He is a native of St. John, N.B., was graduated from Acadia University in 1901, and shortly thereafter entered the service of the Bank of New Brunswick. He was latterly manager at Halifax, and after transferring to the Bank of Nova Scotia, left the realm of wickets and bank bills, to direct the affairs of the most pretentious carriage manufactory in the history of the Maritime Provinces. The outlook at that time was not overinviting. The company was known to be in a very disorganized condition as a result of several misfortunes. A serious accident to the factory building, while nearing completion, combined with other delays, had plunged the business into a state of chaos and inactivity, which resulted in loss of every description, but Mr. Baker tackled his job with earnestness of purpose that foreshadowed eventual triumph over every obstacle. Starting with an uncompleted building and adverse conditions, he has in two years thoroughly equipped a four storey factory, 340'x 60', from which has been shipped nearly 3,000 vehicles of all kinds.

He has inspired his staff with much of his own enthusiasm, and a jealousy for the maintenance of the high standard which the finished product of Nova Scotia Carriages Limited enjoys throughout Canada.

Splendid Facilities

A representattive of the Maritime Farmer was recently accorded the privilege of visiting the plant and was agreeably surprised at the splendid facilities provided for the manufacture of the many itneresting lines which are included in "Nova Scotia Carriages." "Quality, Durability, Finish," an appropriate motto for Nova Scotia carriages, is stamped on every part of this well furnished factory and the system which pervades it.

The wood working departments and its offshoot, the bench room, have no superiors in the whole Dominion, in their comprehensive arrangement. The blacksmith and gear shop is the last word in its adaptability for economic production. The painting, upholstering, assembling, mounting and crating, and shipping departments call for the same high praise. In a word, by coordinating every branch of its splendid system, not a single detail necessary for the production of the highest grades of carriages and sleighs of all classes is overlooked or missing. Thus it is that the management have based their claim that no rival in the carriage business has anything on Nova Scotia carriages, and are enabled to place behind their finished product a guarantee of high quality, based on practical tests, which at once convince the most skeptical that the manufactures of this concern are just what they are represented to be, the best that experienced workmen and carful attention to detail can produce.

The stock room from which supplies for Nova Scotia carriages are drawn, is one of the exclusive sections of the plant. Looked and watched over by a competent expert, it serves out just what is needed for every special line in the long list of the productions of this interesting hive of industry. There is absolutely no waste and therefore no unnecessary added cost for patrons to meet. There are no mistakes made in supplying parts, so that into every carriage and sleigh enters only intended essentials. There can be no costly mistakes of production and from a customer's viewpoint no annoying introduction of something that should [illegible] which should appeal to the loyalty of the Maritime Province buyer.

Capable Sales Staff

Thus far the company has confined its attention largely to the Maritime Province trade. It is now reaching out for larger and wider fields. Bill C. Rayworth, the well known and hustling sales manager of the concern, has just returned from an encouraging tour of the west and is enthusiastic over the sales prospects of his goods, in that part of Canada. In Quebec the firm is represented by L. Duhamel, formerly of Ottawa, an experienced carriage manufacturer and until quite recently manufacturer to His Royal Highness, The Duke of Connaught. Assisting Mr. Rayworth in the Maritime Provinces, is Mr. John Kennedy, who needs no introduction to the majority of Maritime Farmer readers.

Behind General Manager Baker and this capable staff of sales agents, which by the way is to be presently added to, are a board of directors, which includes some of the foremost business men of Nova Scotia. At the head of the board of directors is Percy C. Black, who is also president of the Amherst Boot and Shoe Company and associated with the conduct of many other large manufacturing undertakings. Mr. D. A. Morrison, another of Amherst's most influential business men, a director of Morrison, Ltd., and a number of other well known firms, is the vice-president.

Under such favorable auspices and with goods of the merit of Nova Scotia Carriages to offer, the future of Nova Scotia Carriages Limited may be watched with a solid confidence that it will continue to thrive and that its goods will be even better known with the coming years.

"Silage Crops For the Maritime Provinces."

"O. P. V. Ensilage."

A few years ago a number of silos were built in Nova Scotia, with the idea that they could be filled with corn, and that this crop would help materially to solve the problem of how to get cheap and succulent feed for cattle during the winter months. In some parts of the province this plan of growing corn and filling silos has worked out fairly well. This is true for the south-western counties, but in the northern and eastern counties corn has proved to be too uncertain a crop to allow it ever to become of great value to the farmer.

In some few localities, oats, peas and vetch have been sown together and put into the silo in the same was as corn. This mixture, called O. P. V. Silage has been tried at the Agricultural College Farm in Truro, for the past two years and has given good results. In the spring of 1914, on May 13th, 5.7 acres were seeded with oats, peas and vetch at the rate of 1½ bus. oats, ¾ bus. peas and ½ bus. of vetch per acre. This was put on good land and yielded an excellent crop. The 5.7 acres gave 65 tons of green feed, or at the rate of 11.4 tons per acre. This material contained 28.0% of dry matter, which was 8% more than was contained in corn silage grown on the farm the same year.

The O. P. V. crop was cut on August 2nd with a regular mowing machine, and hauled directly to the barn and run through the ensilage cutter into the silo. It was fed out during the winter to cows and young stock and was eagerly eaten by all the cattle.

In 1915 six acres were seeded in the same way as 1914 except that the proportions of seed were changed. The amount used per acre was 2½ bus. oats, 1 bus. of peas, and one-third bus. vetch. Unfortunately, a part of the land on which this was sown was not dry enough to raise a good crop this next season. The yield, however, was about ten tons per acre.

This was cut when the oats were just beginning to enter the dough stage. If cutting is delayed until the oats begin to ripen the mixture will be too bulky for its weight and will not settle closely enough in the silo to make it keep well.

This O. P. V. silage will furnish a large amount of feed per acre and is much relished by the cattle. It helps to solve the serious problem of how to harvest heavy crops of green material in our moist climate. This mixture might well be grown for hay if we were sure of steady dry weather for two weeks at cutting time. Rainy, "catchy" weather, however, makes it practically impossible to cure second growth clover, and such heavy crops as ten tons of oats, peas and vetch.

Those interested in this crop will be able to see it fed to the cows in the College barn during the short course to be held at the Agricultural College, Truro, for January 4th to the 14th next. Balanced rations using the O. P. V. Silage will be figured out as well as other rations using turnip, corn and grain feeds, and their cost and value carefully compared.

THE HORSE

Young Colt Becomes Fearless if Taught to Obey when First Trained to Harness.

A few days ago, driving a filly that I was breaking to harness I turned into an unaccustomed road and presently came to a place where recent rains had made a broad, shallow pool of water, extending the full width of the road and some fifteen or twenty feet in length.

Miss Filly stopped suddenly; she had no notion of trusting herself to the "dangers of the deep." To be sure, it was only five or six inches deep in the deepest part, but how was she to know that? She had already been taught that ordinary puddles in the road were not bottomless, but this great inland sea was different. To her excited mind it might be a thousand feet deep, with perhaps greater terrors lurking beneath its muddy surface. The demand of her driver that she attempt to cross it was quite too unreasonable to be even considered.

I let her stand a few minutes till her first terror had somewhat abated; then I quietly urged her forward. It was at least a couple of minutes before she finally approached the edge of the pool and very gingerly put one forefoot into it. Then, finding that the water was wet, she jerked her foot back and, with a sudden jump, turned nearly tail about and placed a more satisfactory distance between her position and the bottomless pit.

Again I coaxed her till she again approached the water. This time she put both forefeet into it. Then, just as I noted signs that she was about to repeat her jumping-back performance, I struck her sharply with the whip. She sprang wildly into the air—but forward, as I wished, not backward—landed squarely in the middle of the pool and rushed across it.

After driving a little distance I turned about, drove back to the pool, and crossed and recrossed it till she had not the slightest nervousness about it. Later, during the same drive, she crossed, wtihout any hesitation, a considerable stream whose steep banks and generally forbidding appearance might have alarmed many an older and so-called well-broken horse.

How Bad Habits Start

I have given this detailed description of a very simple occurrence—but which, simple as it was, might have laid the foundation of a bad habit—because I wish you to note carefully what I did and the order of its doing.

First, I showed my filly, with all the gentleness and patience that I could, and there was noting to fear in what seemed to her so terrifying. Then, when she had had ful' opportunity to understand me, I made it clear to her that in any event she must cross it, whether she wished to or not. In other words, that while I sympathized with her fear, and was willing to explain it away, she must nevertheless realize that I was her master and that she must always do my bidding.

Now the way that I managed my filly is the way in which all horses should be accustomed to objects they fear, and constitutes the first and all-important step in making a fearless horse out of a timid one. For, as the horse reasons far more from experience and far less from observation than man, the impression of such a lesson on his mind is not only strong but two fold. It has taught him that that particular object of his fear is harmless; it has also begun the impression—which, as it is not so clearly evident, must be strengthened by repeated similar experiences before it gains much foothold—that the things his master requires of him are all right and will not hurt him.

Accustom Horses to Objects.

Is it necessary then to accustom the horse with equal care and pains to every new object that he fears? Assuredly. And, if, for instance, the next thing that frightens him is a log in the grass by the roadside—which. you may be sure, his excited imagination transforms into some great beast, ready to spring upon him—he must, in exactly the same way, be first shown that it is harmless, and then be made to pass it quietly. It may take quite as long as it did to make him indifferent to the pool of water which at first so terrified him. But do not be discouraged. For after repeated experiences of this kind he will, if handled rightly on every ocacsion, gradually come to have less fear of a new object of terror and his fear will be correspondingly easier to overcome. And thus you finally have a fearless and sensible horse, where at first you had a timid and foolish one.

"Takes patience," do I hear you say? Yes, lots of it, and some other qualities too. But no man of ordinary intelligence, if he believes that good horsemanship is worth while and realizes that self-control is necessary before he asseys the control of animals, need fear that he has not the needful qualifications.

Of no less importance than the horse's conduct when confronted by a terrifying object is his behavior in case of a break-down or other accident. It is not a very desirable animal who kicks or runs away if the harness breaks or the vehicle behind him makes strange noises.

In this respect I have found nothing of such good discipline for the colt as light farm work, such as plowing old ground, harrowing, cultivating, and the like. This accustoms him to the rattling of implements and chains, and the dangling of traces and whiffletrees as nothing else can. It also has a wonderful steadying and civilizing effect. I have frequently heard it said that highly bred colts, of carriage stock, ought not to be put to such work; but this, assuming always that the colt is large enough and strong enough for the task, is sheer nonsense. Of course, care and judgment are always necessary; the work should not be too heavy nor too long continued. An hour a day or, if strong enough, two hours, one in the forenoon and one in the afternoon, is enough. Remember, we are doing it for the good of the colt and not for the work we get out of him.

One of the best illustrations of the value of this kind of training was furnished by a pair of chestnut colts that I raised many years ago. Both were from thoroughbred dams, by a standardbred horse. They were naturally rather nervous, and high-strung, and at the time of which I speak were four and five years old, respectively.

One day we were out driving with these colts, our party consisting of my wife and a girl friend, our four little children and myself.

It happened that my neck yoke was a new one and it had a flaw in it that I did not suspect,as it was concealed by the paint and varnish. Right in the steepest part of a hill it snapped in two in the middle; the pole dropped to the ground, and the carriage, which had no brakes, ran unto the colts.

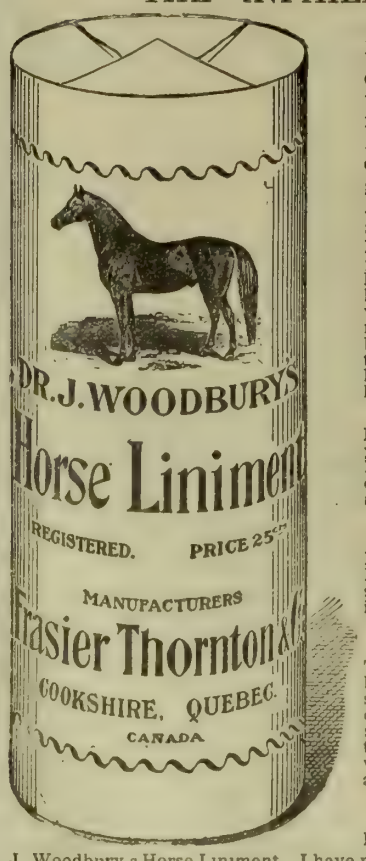
The colts were startled, of course; but I had no difficulty in soothing them and making them stand quietly, holding back the carriage with their haunches until everyone had got out. Had the colts not been accustomed to farm work and dangling whiffletrees around their heels, the case might have been far different. They proved the value of their training. But you had better believe, with those two women and those four little kiddies in the carriage, I was a mighty anxious and unhappy man till I got them out!

I recently had a letter of inquiry from a young woman who stated that she lived on a farm where several colts were raised every year, and that nearly all of them were "unreasonably timid" when first used on the road. And she asked me two questions which fortunately were easy to answer, for I have sometimes thought that young women have a special gift for asking difficult questions.

Why are Animals Timid?

Her questions were, first, "Are horses naturally timid animals?" In this connection she cited the common ues of the horse in war. Second, "Are there breeds or kinds of horses that

Dr. J. Woodbury's Horse Liniment
THE INFAILLIBLE REMEDY



For the removal of Splints, Bog Spavins, enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough Enlargements of the Glands, Affections of the Kidneys. For distemper, strangles, and colic it is infallibly the remedy All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the forefeet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured. Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions. Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs:—We do not hesitate in recommending your Dr. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts and would say that no lumberman should be without it.
Yours truly, Clarke Bros.

Hubbard's Cove, N. S.
Dear Sirs:—I have used Dr J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use.
Yours truly, C. C. McLean.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung deseases. It is the best to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities which may exist and gives the system healthy action.
Newton Lee, Owner "All Right" 5817.

Elmsdale. N. S.
Dear Sirs:—Kindly send me 6 dozen bottles Dr. J. Woodbury s Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take. Yours truly, Elmsdale Mercantile Co.
Elmsdale, N. S. Dear Sirs:—I cured my horse with Dr. J. Woodbury's Horse Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly, H. R. Whitehead.
Dear Sirs:—One of my horses had a bad cough and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months standing. In my large experience with horses I consider this liniment to be the best made for all diseases in the horse, I recommend it to my friends. E. J. Anderson, Truro, N. S.

LEADERS IN THE FIELD OF BUSINESS.

Among our graduates are boys who have risen to positions of sales-managers, superintendents of factories, branch houses and manufacturing plants, cashiers n banks, leaders everywhere in their respective fields. It pays to attend the Moncton Business College.

Geo. J. Schmidt, Principal

Moncton, N. B.

are more fearless than others; and, if so, what are they?"

To the first: Yes; the horse is by nature a timid animal, as, generally speaking, all animals are to whom Nature has given powers of swift flight as their chief means of self-preservation. Of course individuals differ in this respect, but the rule is so general that it should never be lost sight of in training. That the horse can be trained to war, simply shows the extent to which his natural impulses can be modified and subdued by the art of man.

Second: Breeds of horses do differ in regard to natural timidity. The pure-bred Arab is beyond all comparison the most fearless horse in the world. It is possible that this may be owing in part to the fact that his natural development was for long ages in an open country, where he was not in constant danger from unseen foes, but chiefly, I think, because he is a higher evolutionary type than any other horse.

The small ponies of the far north probably rank next to the Arab in fearlessness. I once bought an Iceland stallion and three mares and bred them for many years. I do not recall that any of them ever showed fear of anything—at least, to any extent worth mentioning. Breaking them to harness and accustoming them to the road was a pastime rather than a task.

The well-bred draft horse is one of our most sensible and level-headed horses, and, as would naturally be expeaced, less subject to unreasoning fear than those of a more nervous and excitable type. In this respect it is well to note that he is a much greater departure from the original type of wild horse, who had always to be on the watch for enemies. So, for instance, a piece of paper blowing in the road is more likely to appear to him what it really is than some wild live thing, ready to strike at his foot like a venomous serpent.

But the draft horse, sensible and reliable as he generally is, sometimes disgraces himself quite unexpectedly; in fact, a colt is a colt, whether of draft stock or otherwise, and too much should not be expected of him. I was once on a city street with a pair of young Percherons that had never shown much fear of things, when a circus parade came along. They paid little attention to the elephants, the band wagons, or even the shrieking and deafening caliope. But presently appeared a lofty and gilded wheeled structure upon the top of which sat a large lion and beside it the Goddess of Liberty as personated by a weary-looking young woman with one arm resting in friendly fashion upon the lions' neck. My colts became insanely frightened, sprang upon the sidewalk in spite of all my efforts, and wrecked, with a glorious and resounding smash, the show window of a department store—a performance much appreciated by the gazing crowd, who were out for excitement and were getting it.

Blinders Reduce Use of Whip

I have often been asked if the use of blinders is not a needless and foolish practice, and if I do not consider it cruel. To both of these questions I answer, no. The purpose of blinders is not to prevent the horse from seeing things and taking fright at them, but to render him pleasanter to drive. Forward, and by merely turning his head sideways he can see about him as well with them as without them; and it is not always desirable to have him see what is going on in the carriage behind him. No, I don't mean what you and Jennie may be doing when you take her out for a drive; I only mean that if he has the least bit of tendency to laziness—and this includes a tremendous number of pretty good horses—he will, if driven without blinders, soon get into the habit of driving with his head carried very slightly on one side, and one eye cocked back into the carriage. If his driver reaches for the whip he will detect the motion at once and quicken his pace and continue as long as the whip is held in the hand; then, when the whip is put back in the socket, he will slacken up in a very provoking way. The majority of horses drive better with blinders than without them. On the other hand, a great many drive just as well without them, and in such cases, especially if the horse has a handsome head, I always prefer the open bridle. So if your house goes well without blinders and you prefer an open bridle, by all means use one; it is, I think, preferable where it works well.

But don't abandon blinders because you think them cruel, for, properly adjusted, they give the horse no discomfort or inconvenience whatever.

It seems almost superfluous for me to add that the colt when being broken to harness should of course always wear an open bridle, whether blinders are used later or not, for he should have every opportunity to become as familiar as possible with all the rigging with which he is surrounded, carriage and revolving wheels included.

I have tried here to explain some of the more important points in making timid horses fearless—an important matter for all who use horses, for unless the horse is at least comparatively fearless he is not safe, and the dangerous horse no one wants.—David Buffum, in Ottawa Valley Journal.

Bonnie Buchlynie, a nine-year-old Clydesdale was recently sold at auction in Scotland, and purchased by a Scottish breeder for $26,250. His sire, Baron Buchlyrie was sold for $47,500.

Seized With Paralysis Could Not Walk

Most Extraordinary Cure Effected by the Use of Dr. Chase's Nerve Food.

To have the nervous system paralyzed, to be unable to walk and scarcely able to talk, and then to be completely cured, is not a usual experience, but Mr. Hyatt tells in this letter what he passed through. Doctors told him his case was hopeless, and when they gave up he turned to Dr. Chase's Nerve Food and obtained complete cure.

Mr. Avery Hyatt, balcksmith, St. Anns, Lincoln Co., Ont., writes:—"I am a blacksmith by trade, and ten years ago became afflicted with paralysis. I could not walk or read or write, and could talk with difficulty, so that it was a hard matter to understand anything I would say. Being only a young man, I was nearly discouraged. Two doctors told me it was brought on by overwork, and that my case was hopeless.

"One day my father read about Dr. Chase's Nerve Food, an dadvised me to try it. I bought 12 boxes, and when the fifth was used I saw that I was getting better. By the time the 12 boxes were used I was cured. I am well and strong and working every day, thanks to Dr. Chase's Nerve Food."

This statement is certified to by Mr. Elmon J. Hodgins, J. P.

No ailment is more dreaded than paralysis. And yet how few people realize that paralysis of the nerves is only the natural result of neglected nervous troubles.

At first you do not sleep well, have nervous headaches or indigestion, find yourself easily irritated and annoyed, can hear noises which in good health you would never notice. You do not consider yourself sick, and yet you lack the usual energy and vigor and feel out of sorts.

Restore the nerves by using Dr. Chase's Nerve Food. 50c a box, 6 for $2.50. All dealers, or Edmanson, Bates & Co., Limited, Toronto.

The Messenger Maid

By Helen Wallace.

The mistress of Calderside stood at the high window of her drawingroom, gazing steadily down into the courtyard below. The old house had been built a century before, when, with a French queen upon the throne, French influence was at its height in Scotland, and Calderside might have been modelled from many a Norman chateau, whose steep-pitched, heavily-slated roof and quaint pepper-box tourelles still peep out above the tufted orchards of that pleasant land. It formed two sides of a square, and on the third, across the court, stood a range of stables, from which came a clinking of bridles, a stamping of hoofs, and loud voices and laughter—most unusual, save on some great occasion, for a quiet country-mansion remote in its fields and woods.

But it was no festivity which had filled the stables to overflowing and crowded every corner of the house even to the garrets high up beneath the steep roof. The Laird of Calderside had not, indeed, openly taken part in "the rebellion," that last dying struggle of loyal hearts, which had just been quenched in blood at Culloden. He was shrewdly suspected of Jacobite sympathies though, and half a troop of horse had been quartered on him to overawe the countryside and to watch for stray "rebels," who, with a price upon their heads, were now seeking the coast, in the hope of escaping to France. And the chief prize among these would be young Nigel Maitland, a near kinsman of Lady Calder's. He had been one of the Prince's right-hand men, and it was now believed that he was lurking somewhere in his own neighborhood.

Lady Calder was not consciously hearing the unwonted noises, nor seeing the occasional dragoon who strode across the sunny flags beneath her high window, but both sights and sounds served to heighten the panic anxiety which possessed her. Some words, caught by chance, had left no doubt that the neighboring house of Ledington was to be closely searched, how soon she did not know, the illness of its aged mitress having alone saved it hitherto from more than a cursory inspection.

"We can't wait any longer; the old woman won't recover while there's a Jacobite to smuggle out of the country. She may have a posse of them behind the bed-hangings—Nigel Maitland himself, like enough. Well, we'll have to ask her to change her bed for a day, or rout her out of it," Major Walsh had said with a laugh, and then the door which had been ajar was shut, and Lady Calder had heard no more.

But she had heard enough, and now who was to carry the warning to Ledington—that warning so urgently needed—who? She and her husband were virtually prisoners in their own house—he might soon be a prisoner in reality. She dare not propose to ride to Ledington, nor could she commit such a trust to any of her servants. They were suspect too, and while to the loyal among them it might bring dire trouble, to the waverers it might be too sore a temptation. Yet the message must go, or young Nigel's days were numbered! With clasped hands and unseeing eyes she stood gazing before her, desperate in her helplessness. Those men mounting below might even now be setting forth for Ledington. The warning must go, but how—in God's name, how?

A deep sigh of unbounded satisfaction and relife sounded through the stillness.

"I have finished my sampler, to the very last stitch," said a child's voice, and Lady Calder started an dturned round. In the recess of a window at the further end of the room a child had been sitting, so still that it was no wonder her mother had forgotten her presence. Now she came across the room, a quaint figure, in her long-waisted, long-skirted gown, like a little old woman's, contrasting oddly with the pale, serious child-face round which the dark hair was dressed in heavy falling curls.

In her hand was a square of fine canvas—one of those wonderful "samplers," which their fortunate possessors are nowadays unearthing from the forgotten recesses of old chests and drawers, and which fill one with wonder and pity for the tiny hands which wrought them, and the young eyes which must have pored so closely over them. The one now held up for Lady Calder's inspection was a marvelous example of its kind. Within the scroll-border of "flammi" work, as it was called, the alphabet was repeated again and again in every size and variety of letter. In the centre was a wonderful representation of the old house of Calderside, tourelles, steep roof, crow-stepped gables and all, in the midst of a grove of very Noah's Ark-looking trees, while underenath, in the most delicate, fairy-like stitchery, were the four times.

"Isabel Calder is my name,
Scotland is my nation,
My parents they were very good
To give me education."

Poor little nine-year-old Isabel, her education in life and the world was yet all to come, but she had already been to a hard school, and the dark eyes now lifted to her mother's face may have owed some of their wistfulness to the long hours spent in fashioning these endless A's and B's and C's. But children were not consulted in those days as to their wishes, and as Lady Calder was a conscientious mother, Isabel had been so well brought up that she may never have consciously rebelled against the hours of sewing in summer sunshine or by the dim lamp in the long winter "forenights." Only as she watched her mother's face she heaved again that deep, unchildlike sigh.

Across Lady Calder's face a look flitted, which little Isabel could not read, the look of one who in desperate straits suddenly sees a door of escape open. Then it vanished, and she turned to the child.

"You're a good bairn, Isabel," she said. "You'll be able to mark my new blankets now, and your own, too, some day.

No great reward after such long toil it might seem, but praise, like a caress, was scant in those days, and since things are largely valued for their rarity, Isabel was wholly satisfied with this very moderate tribute. She flushed with pride. She was to be entrusted with a woman's work!

"Would you like to go to Ledington and show your work to your granny-aunt (great-aunt) Maitland?" went on Lady Calder, a veiled eagerness in her tone.

Isabel looked down and shifted from the one foot to the other, but all she said was, "If you'll come with me."

"No," my lassie, I must send you your lone," said her mother, and then dropping on her knee beside the child and putting an arm round her, she went on, "Now, Bell, you must mind what I say, for it's life or death. If you see your granny-aunt alone you're to say to her from me that there must be nobody in Ledington tonight—nobody but those belonging to it," with slow emphasis. The bairn was wise and menseful (thoughtful) for her years, still she was but a bairn; she must not be burdened with a more direct message, thought Lady Calder, looking into the troubled young eyes. After a moment's pause she said, "If there's no chance of that you'll show her your sampler. She'll know fine I wouldn't send you at a time like this only to show off a bairn's work, and she'll be on the look-out. You'll tell her which of the letters you found hardest to do, and you'll point to this and that," swiftly touching one and another: "but you'll let your finger rest a moment on this," pressing hers on a very elaborate G and then passing on to an O. "'Tis a poor device," she sighed, "but I can think of none better, and if Major Walsh or any other one asks why I'm sending you to Ledington, it's to show your sampler—only to show your sampler, Bell," with pieous insistence, "They mustn't guess anything else, or it'll but make bad worse."

"They won't," said Isabel, her dark eyes kindling, and her li'tle figure seeming to expand wiih the very might of her resolve. This was a greater thus than the marking of the blankets. "They'll get nothing from me."

"A sharp rap at the door stopped the words on her lips. It was immediately followed by the entrance of a smart, middle-aged soldier.

"Your pardon, my lady, by I thought Calder was here," he said in a loud, jovial voice.

"No, but I was just about to seek you, Major Walsh. My little lassie here has finished her sampler at last, and nothing will serve her but she must show it to her granny-aunt at Ledington. I expect there was something promised when it was done, eh, Bell?" said Lady Calder, stroking the dark curls." The bairn may go, mayn't she?"

"To Ledington!" said Major Walsh with an odd smile, while the careless bonhomie of his face seemed to stiffen like a mask over some keen purpose beneath. "Well, little maid, come and show me this wonderful work, and we'll see about it."

He took the canvas from Isabel's hand, scanned it closely, front and back, then he thrust it into his pocket with an eye on Lady Calder's face as he did so. But if he looked to read disappointment there, there was no trace of it.

"Those little fingers must be tired after setting so many stitches. They deserve some reward, so I'll e'en take little Miss Bell myself, since she's so set on it, and I'll carry her sampler for her," he said wtih a laugh, "Bring her cloak, and we'll go e'en now."

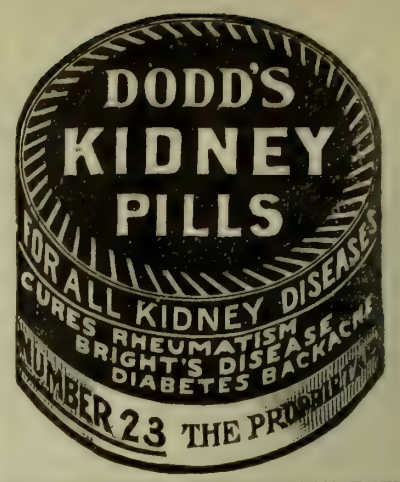
Isabel pressed close to her mother's side. "Must I go with him? I'm—I'm feared of him," she whispered.

"You'll be a brave lass. You're the only one I can trust," breathed her mother, as she tied on the scarlet cloak and drew the hood over the dark curls.

But for all her pride and resolve it was a very white-faced child who was promptly perched up on the front of Major Walsh's saddle. Had she been in the clutches of an ogre she could not have been more terrified, and to her he indeed seemed such. She had heard the story of Culloden, and was not Major Walsh here to hunt to death the few who had escaped from King George's vengeance, and above all that some one who was to "Go" from Ledington. Even her own father was not safe from him. But her Spartan training stood her in good stead. Children must obey they elders, and speak only when they were spoken to, so she answered Major Walsh's questions readily enough, till, looking down into the little snowdrop face, he grew half-ashamed, tough soldier and keen upon his quest as he was, of baiting the child further, and trying to draw from her if she had any subtler errand to the lady of Ledington than the showing of the sampler. He had ensured that no note had been sent with it, and after all they could know nothing fresh of his plans at Calderside.

Arrived at Ledington, he even carried his complaisance so far as to conduct Isabel up the corkscrew stair to my lady's chamber door.

"Here's little Miss from Calderside with something to show to your mis-



A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write today. Address: Mrs. M. Summers, Box 309, Windsor, Ont.

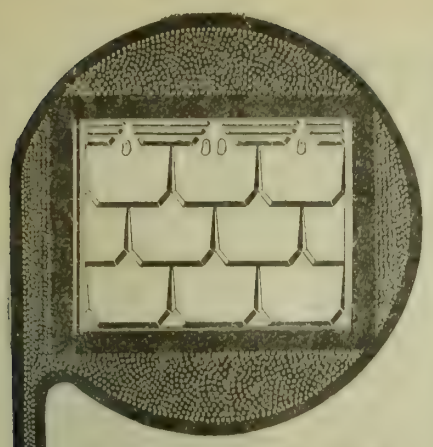
Heart Was So Weak Could Not Go Up Stairs Without Help.

When the heart becomes weak and does not do its work properly the nerves become unstrung and the whole system seems to go "all to pieces."

When this happens you need a tonic to build up both the heart and nerves, and Milburn's Heart and Nerve Pills will accomplish this for you, providing you do not let your case run too long and allow it to become chronic.

Mrs. Evangiliste Loverdure, Fort Coulonge, Que., writes: "Last summer my heart and nerves were so bad I could not sleep at night, and my heart was so weak I could not go up stairs without help. My doctor said he could do no more for me as my heart was completely done. A cousin of mine came in one day and told me that Milburn's Heart and Nerve Pills cured her completely. I immediately gave her 50 cents to bring me a box, and since that day there is a box always on my sideboard. I am now well, and my heart and nerves are stronger than when I was a little school girl. I advise anyone with heart trouble to try them. No doctor can beat them."

Milburn's Heart and Nerve Pills are 50c per box, 3 boxes for $1.25; for sale at all dealers; mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.



Reduce Your Roofing Costs, Protect Your Buildings From Fire, Lightning and Weather

You accomplish all these results by using our heavily zinc coated

"Eastlake" Metallic Shingles

They give longer service than any other roofing. Cost less to lay. Are rust-proof and do not require painting. Those laid 28 years ago are still giving good service. Send for free book that shows how "Eastlake" shingles make your buildings lightning fire, and weather-proof and why they cost less per year than any other roofing.

E. L. COLPITTS,
PETITCODIAC, - N. B.

tress," he said brusquely to the startled waiting-woman. "She can have ten minutes," and he clattered down the steep stair again.

With her heart drumming and her lips tingling from the kiss Major Walsh had exacted in payment, Isabel tip-toed across the big bedroom, with its Dutch hangings of hunting scenes in stamped and gilded leather. In a great four-post bed an old lady was sitting up very erect for an invalid. "So we've got a respite," she said, with a quick, hard breath.

With tremulous steps, Isabel approached the canopied bed, feeling, perhaps, as at that moment she looked, like little Red Riding Hood paying her famous visit, and, indeed, many older than she trembled before the old lady's keen dark eyes looking up from under the multitudinous lawn frills of her mobcap. But the eyes softened at the sight of the child. The sampler was examined and admired, but as soon as the heavy footfalls without had fairly died away, her voice and look changed.

"Quick, child, you've got some message. We've only ten minutes, 'tis a wonder he let us have them. Since you've been trusted with it, I'll trust you too. The one it most concerns had better hear it too."

With her long ebony-handled staff, she rapped sharply on the wainscott thrice in succession. There was a moment's pause, then there came a faint scratching, like a mouse, behind the panels. The old lady rapped again, and Isabel's dilated eyes opened still wider, for the great gilded stag bounding across the wall in front of her suddenly disappeared, leaving a narrow, gaping doorway.

"Oh!" gasped Isabel, and "Oh!" she gasped again, as out of the darkness stepped a tall young man. But Isabel had no longer eyes for the stag, nor any heed for the mystery of the cunningly-hidden door. Her eyes and thought were wholly riveted on the new-comer, and little wonder, for Nigel Maitland was reckoned the "brawest lad" of his time in broad Scotland. It was not the well-cut features though, nor the curling hair, and the handsome eyes, which held the child's gaze, and, all unknown to herself, unsealed within her the fountain of romance. Rather it was the high daring of his look, the glad, gay courage which danced in these fine eyes, so that, worn and wan, and wounded as he was, his entrance from his dark lurking-place seemed to bring a waft of new life, bracing as mountain air, reviving as wine into the big, dull room. Isabel, too young to analyse her own thoughts, gazed open-eyed, the old lady sat more erect among her pillows, her eyes lit up.

"Now, bairn, out with your message!" she said sharply. "I'm trusting you far ,and every minute's a life."

Thus adjured, Isabel repeated her mother's words.

"She said I was to say that there must be nobody in Ledington tonight—nobody but those who belong to it."

The gay, bright eyes were fixed now on her earnest face framed in the scarlet hood. "And did she say why, little lady?" he asked.

"No, but she said it was life or death. I think she's feared of Major Walsh. He's a dreadful man; he brought me here on his saddle"—with a quick shiver—"and he'll have to take me back," her voice sinking.

"Tell your lady-mother she's had a brave little mesenger, and take her my thanks from my heart for her care of my poor life," said Maitland. "And so this is what you were to show your granny-aunt?" picking up the sampler, after a question or two had brought out the whole story.

"Nigel, are ye daft?" cried the old lady from the bed. "He gave us ten minutes. When he comes back he may bring his dragoons with him, and this time I'm doubting I'll no' be let keep my chamber-door fast against him."

The young man turned on her with a smile.

"Never fear, there'll be 'nobody' in Ledington very soon but those who belong to it; but as my next lurking-place must be the family vault in the kirkyard, you can't wonder I'm in no hurry to seek it. Who knows but it may be my final refuge, unless Sandy Crerar brings his yawl the sooner round St. Abb's Head? No, no, we'll cheat them yet," hastily as the aged face changed woefully at his light words. "And so you are Isabel Calder, and you've done all this wonderful work," reading the doggerel lines as he turned again to the child. "I shall never forget you, Isabel, nor the great service you have done me; and who knows," with a smile, which to Isabel illuminated the room or the world—it was all one then —"who knows but some day I may be able to deliver you from Major Walsh or some other dragon. And now promise, you won't quite forget me."

(Continued in Next Issue.)

A Substitute Bath Room.

Soon after I completed my college course, my mother's health began to fail, and I went home to care for her.

Our house was an old, rambling farmhouse, without any modern conveniences. These I missed very much; but, most of all, not having a bathroom. I did not want to ask father to fit one up, as I knew money was short.

One day an idea came to me, which seemed to be a solution of my troubles. We had a small room opening off the kitchen. It was originally intended for a milk room, but was now used as a store room. Mother readily gave me permission to do what I wished with it.

The floor, which was a painted one. was scrubbed, and over the spots where the paitn was worn I placed some washable rugs, which I made from an old rag carpet.

A table large enough to hold a wash bowl, pitchers, soap dishes and mugs, was covered with white enamel cloth. tacked securely over the edge, and was made to do duty as a washstand. Back of the table on the wall I tacked another piece of enamel cloth, the full length of the table and high enough to catch any splashes of water. Over this hung an old-fashioned mirror. Beside the table was a towel rack, such as used to come with the old style chamber suites; also, a large covered pail for waste water.

An old bureau held towels and toilet articles. A large packing case, covered with gingham from an old dress and lined with enamel cloth, mad: an excellent hamper for soiled clothes.

I sawed three inches off the legs of a kitchen chair, and thus made it a convenient height to sit in while putting on shoes and stockings, or to bathe the feet.

On one side of the room near the window I placed another mirror and a bracket lamp, so that father and the boys had a place to shave.

Since I can remember, an old tin bathtub had hung in the barn. I took this down and gave it a coat of white paint and enamel on the inside and blue on the outside.

A small table held a one-burner oil stove with a covered dish. This was handy to heat a little water, while the reservoir of the kitchen stove served when we wanted a bath.

Hooks on the doors gave a place to hang clothes.

When I had completed my furnishings, I found that it had cost little more than a dollar—enamel, cloth and white paint and enamel being everything that I had bought.

We all enjoy the room, and only the other day I heard father tell mother that he wondered why they had never thought of fixing it up.—Cora M. Devlin, Mass, in Exchange.

The Lightning Cure for
COUGHS, COLDS
and all Bronchial Troubles.

No curative preparation can possibly be quicker in action than Veno's Lightning Cough Cure. You don't have to wait for the effect, relief comes with the first dose, and in ordinary cases cure follows with a rapidity which fully justifies the title "Lightning." Even in old deep-seated bronchitis and asthma Veno's can be relied upon when all the usual means fail.

Awarded Grand Prix and Gold Medal, International Health Exhibition, Paris, 1910.

That award is the hall-mark of international scientific approval. The approval of the public is expressed in a reputation which is wide as the British Empire. Veno's has the largest sale of any cough preparation in the whole world. It is made in Great Britain by British pharmacists, financed by British capital, and sold wherever the British flag flies. Old and young take Veno's for—

Ducks, A.O.V.—1, Albert Boswall.

LIVE POULTRY SPECIALS

Canadian Rhode Island Red Cup, provincial Silver Cup for the best collection of Rhode Island Reds.—Won

What Did Little Mary Buy?

1916 Ford Touring Car

FIRST PRIZE

For the Best Reply

$1000.00

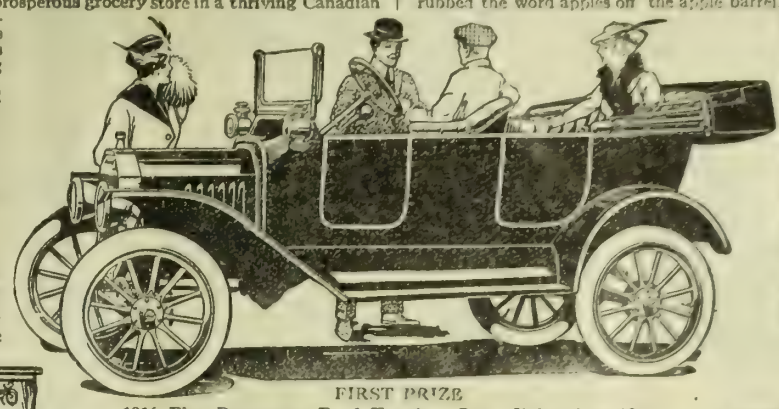
In other Fine Prizes Also Given

JOHN BROWN owns a prosperous grocery store in a thriving Canadian town. He is a live merchant and attributes much of his success to his novel methods of creating interest in his store.

Recently, he took several lines of his regular goods, put them under cover in boxes and barrels, and wrote the name of each article on the outside. Only he mixed up the letters in each name so that instead of spelling the right name of the article, it spelled something different altogether. For instance box 9 contains Raisins, but Mr. Brown jumbled the letters in the words Raisins until they read "Si Rains." Then he rubbed the word apples off the apple barrel, and painted the letters in that name until they read "Plea Pa," as you see on barrel 11.

Fourteen lines of goods in Mr. Brown's store were displayed this way, and a prize was given to any customer who could name an order for all fourteen and tell the number of the box each was in. Little Mary went to Brown's store to make her purchases, guessed all the names correctly and won the prize. Can you do as well?

Two of the names are already given to you to start you right. What are the other twelve?



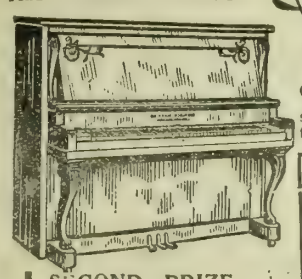
FIRST PRIZE

1916 Five Passenger Ford Touring Car. Value $530.00

CLEVER READERS OF THE MARITIME FARMER sending the best correct or nearest correct sets of answers can share in the distribution of

Thousands of Dollars Worth of MAGNIFICENT PRIZES

Big Illustrated Prize List will be mailed to you direct.



SECOND PRIZE
Handsome Sherlock-Manning Piano, Value $450.00

4th PRIZE
Clare Bros. Famous High Oven Range

THIS CONTEST IS ABSOLUTELY FREE OF EXPENSE

If your answers gain 120 points you will win First Prize

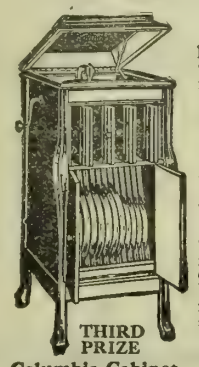
A FEW HINTS.—The goods mentioned under each of the fourteen numbers, are staple lines such as are to be found in every grocery store and in regular use in every home. No trade-mark names or products of any particular firm or manufacturer are given,—just the regular name of each product or article. A good plan is to write down the names of all the things usually found in a grocery store and use the list as your guide. Be careful, because Mr. Brown was clever, and sometimes he made two or three words, and even more out of a name.

The judges will award the prizes in this contest, according to the points gained by each entry, and we will fully advise you of the method, when your answer is received. For instance, 60 points can be gained by sending a correct answer to each of the twelve names you can guess, there are ten points given for general neatness, ten for style, spelling, punctuation, etc., and when you qualify, 40 points additional can be gained. Take lots of time to puzzle out your answer, be neat and careful, and you can win a good prize.

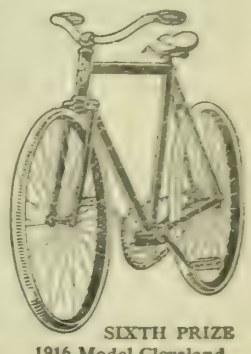
THE OBJECT OF THE CONTEST.—Every loyal Canadian will approve of the object of this great contest. Frankly, it is to advertise and introduce EVERYWOMAN'S WORLD, Canada's greatest magazine, to hundreds of new homes, which should know that a magazine of such excellence and real worth is being published right here in Canada by Canadians for Canadians. You can help us to do this, when you enter the contest, but you do not have to be a subscriber nor are you asked or expected to take the magazine or spend a single penny in order to compete and win the touring car or one of the other magnificent prizes.

EVERYWOMAN'S WORLD is now the established favorite in more than 80,000 of Canada's best homes. Though that is the greatest circulation ever attained by any Canadian magazine, it doesn't satisfy us. Our motto is "Everywoman's World in Everywoman's Home." Hundreds of Canadian homes which may not know it now, will welcome this handsome, interesting, up-to-the-minute magazine, and once it is introduced they will want it every month.

If, therefore, when your answers are received, we find them to have gained sufficient points to merit standing for the judging and awarding of prizes, we will write and tell you so, and send without cost, a sample copy of the latest issue of this greatest of Canada's magazines. Then, in order to qualify your entry, we will ask you to do us the small favor of introducing it to three or four friends and neighbors. We will even send you sample copies to leave with each of your friends, if you will tell us they would like to have them. State your willingness to accord this favor when you submit your answers. The company agrees to pay you in cash, or reward you with a handsome gift for your trouble, entirely in addition to any prize your answers may win in the contest.

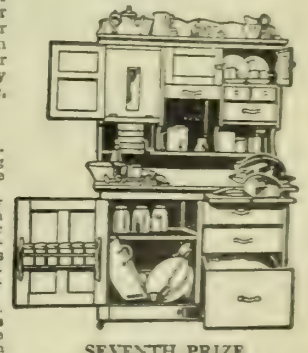


THIRD PRIZE
Columbia Cabinet Grafonola



SIXTH PRIZE
1916 Model Cleveland Bicycle

FIFTH PRIZE
Famous Singer Sewing Machine



SEVENTH PRIZE
Magnificent Ideal Kitchen Cabinet

Follow These Simple Rules Governing Entry to the Contest

1. Write your answers on one side of the paper only, and put your name (stating Mr. Mrs. or Miss) and address on the upper right hand corner. Anything other than the answers and your name and addres, must be on a separate sheet.
2. All letters must be fully prepaid in postage. Do not forget 1c. war tax stamp.
3. Members and employees of Continental Publishing Co., Limited, and of EVERYWOMAN'S WORLD, also their relations and friends are not allowed to compete.
4. Boys or girls under fourteen years of age are not allowed to compete.
5. Contestants will be permitted to submit as many as three sets of answers to the puzzle, but only one set can be awarded a prize.
6. Different members of a family may compete, but only one prize will be awarded in any one family or household.
7. Judging will be done by three Toronto gentlemen, having no connection whatever with this firm. Prizes will be awarded according to the number of points gained on each entry; 120 points, which is the maximum, will take first prize. Points will be awarded for each correct answer, also neatness, handwriting, punctuation, and fulfilling the conditions of the contest. Prizes will be awarded 31st day of March, 1916.
8. Each competitor will be required to show the copy of EVERYWOMAN'S WORLD, which will be sent without charge, to three or four friends or neighbours who will want to subscribe. For this service the company agrees to reward you with a cash payment or a handsome gift. Such rewards to be entirely in addition to any prize your answers may win.
9. This contest is absolutely free of expense. Contestants are not required to be subscribers or readers of EVERYWOMAN'S WORLD, nor are they asked to subscribe or buy anything. In awarding the prizes, the judges will have no knowledge of whether the entry comes from a subscriber or not.

Address your replies to the CONTEST EDITOR, EVERYWOMAN'S WORLD

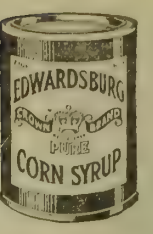
The Syrup of a Hundred Uses



Of course, "Crown Brand" is your favorite Table Syrup. Of course, you enjoy its delicious, appetizing flavor with *Bread, Pancakes and Hot Biscuits.*

But what about "Crown Brand" in the kitchen? Do you use

EDWARDSBURG "CROWN BRAND" CORN SYRUP

for Gingerbread, Cookies, Cakes, Pies and Sweet Sauces for all kinds of Puddings?
Do you always use it for *Candy-making*?
Try it in all these ways. You'll find "Crown Brand" Corn Syrup handy, convenient, economical, dependable, good.

"LILY WHITE" is just what its name implies—a clear corn syrup—more delicate in flavor than "Crown Brand", that is equally good for the table and for candy-making.

ASK YOUR GROCER—IN 2, 5, 10 AND 20 POUND TINS.

The Canada Starch Co. Limited, Montreal.

Here's Something New!

No more ashes to lug, no clumsy ash pan to spill dust or dirt on the kitchen floor

The GLENWOOD ASH CHUTE Solves the Problem

No dust can escape, just slide the damper once a day and the ashes go directly into the ash barrel.

This is only one of the many exclusive GLENWOOD Features.

Thousands of GLENWOOD Ranges in use daily. Every Range guaranteed. REMEMBER Foundry to Kitchen Prices on GLENWOOD RANGES.

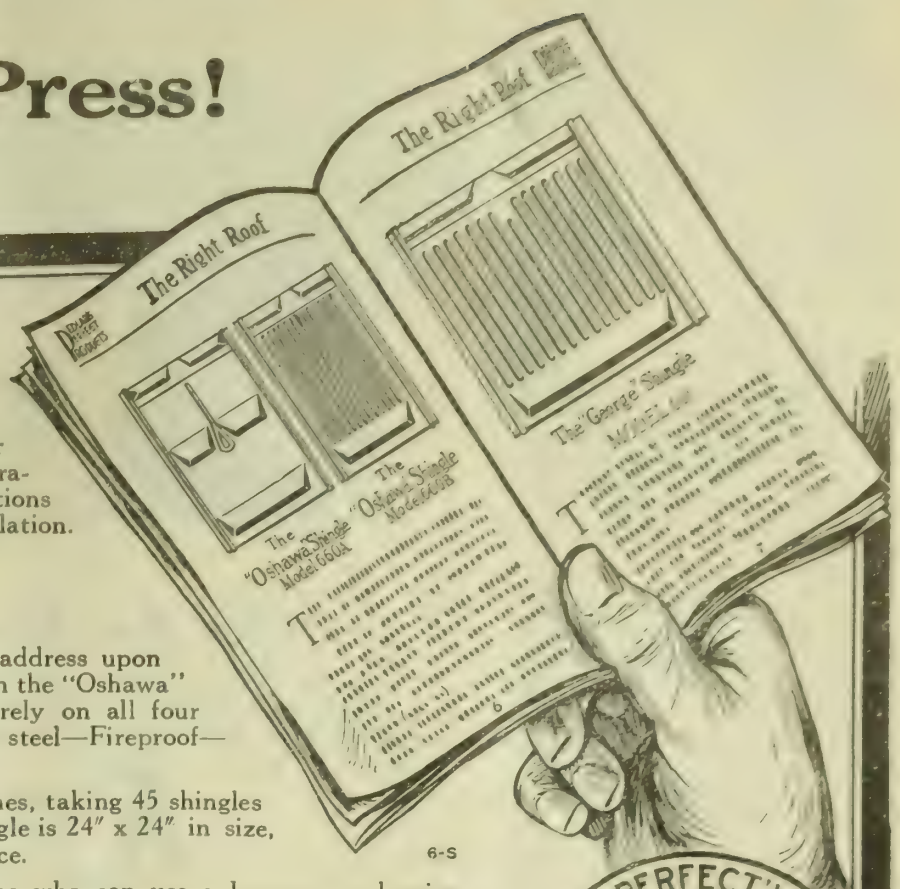
151-155 Union St., ST. JOHN, N. B.

Fresh from the Press!



HERE is a New Book, all about roofing. It tells WHY the roof is the most important part of any barn or building—HOW to protect your barns and dwellings against fire, wind, rain and lightning, and—WHERE the right roofing is sold in your district. It gives full instructions for laying the "Right" Roofing—tells how to build a barn (illustrating the different stages in the construction with reproductions from actual photographs) and contains valuable hints on ventilation. The name of this book is

The RIGHT Roof

You need it NOW. A copy will be mailed, prepaid, to your address upon request. This Illustration shows pages 6 and 7. Here are shown the "Oshawa" and the "George" galvanized steel shingles, which lock securely on all four sides, making a roof that is practically one continuous sheet of steel—Fireproof—Rain-proof—Wind-proof—Lightning-proof.

Each "Oshawa" Shingle has a covering capacity of 16 x 20 inches, taking 45 shingles to the square of 100 feet (10′ x 10′). The big "George" Shingle is 24″ x 24″ in size, and 25 of these big shingles will cover 100 square feet of surface.

6-S

No special tools are required to lay the RIGHT Roof. Anyone who can use a hammer and snips can do the work easily and quickly.

Write TO-DAY for your copy of this valuable book—it's FREE. *Address nearest Branch.*

Cleanliness in the Milk Supply.

(Continued from Page 201)

and producers. Such meetings disseminate knowledge, bring about mutual understandings and mutual respect."

While in attendance at the New York State Convention a few years ago I had an interesting conversation with Dr. Santee, and found he was a man of wide experience in these matters and held most reasonable views regarding this milk question. He is a firm believer in sunlight and fresh air in the stable and claims that cleanliness about the cows, stable and person, together with keeping the milk cold after it is drawn from the cow, will do more to insure a pure milk supply than any other measures we may put into practice. He is a great believer also in the covered or small top milk pail citing experiments that he had made showing that with their use in the average stables saves about 90 per cent of the contamination.

It is recognized that much of the contamination of milk takes place during the milking operation especially if the udder is not dampened by a moist cloth. Just here let me quote from an exchange:

"A Western station made an experiment by placing a 4 inch gelatine plate under the cows udder in a clean stable, holding it there for the time it ordinarily takes to milk, a man going through the motions of milking under the following conditions:

1.—Sides, flanks and udder of the cow were dampened with a solution of 4 per cent carbolic acid and there was no bedding in the stall.

2.—Those portions of the cows' body were dampened with soap and water, cut bedding was used in the stall, and dust was raised by the man walking in to milk the cow.

3—No portion of the cow's body was dampened, ordinary bedding was in the stall and the man softened the udder with his hands, dry, thereby setting free all the bacteria on the udder to fall into the milk.

The result of the experiment showed that under conditions 1, the milk contained 3,200 bacteria per c.c; under condition 2, 4,500 per c.c.; and under condition 2, 19,000 per c.c."

This experiment proves how dampening the cows udder before milking decreases the bacteria, and how the ordinary custom of the farmer, "softening" before milking, increases them.

The same may be said of allowing milk to stand in open vessels in the stable or dusty atmosphere. At Cornell Agricultural Experimetn Station, it was found that more than 5,000,000 bacteria fell itno an open milk can when it was exposed seven minutes in a stable in which the air did not contain an excessively large quantity of dust. When the udder and surrounding parts were wiped with a damp cloth, contamination from this source amounted to less than four per cent of what it was when the udder had been carelessly brushed before milking. A fly falling into the milk may introduce as many as 1,000,000 organisms. A cow's hair was found to carry 26,000 bacteria, and a small piece of hay that dropped from the cow's body was found to carry more than 150,000 bacteria.

Realizing the truth of the above it behoves us to pay strict attention to cleanliness in the milking operation.

In conclusion let me draw your attention to five requirements to be observed in the production of clean and pure milk.

1st—The health of the herd and quality of food consumed. An animal that is diseased is likely to give unwholesome milk. For the protection of the health of the herd provide an abundance of fresh air and light. An occasional inspection by a veterinary will do no harm.

The quality of food and water may have an effect on the health of the cows and thus indirectly the value of the product. Special care must be observed to avoid foods that are unwholesome. It is necessary, also, to avoid giving any single food in excessive quantity.

2nd—Cleanliness of the cows and their surroundings. This implies a reasonable degree of scientific cleanliness in the stable.

3rd—This refers to the utensils and their care. They should be constructed in such a way as to make cleaning easy. This demands freedom from sharp corners and cracks, and places that cannot be reached by a brush, which should always be used in preference to a cloth. They should be sterilized or scalded after cleaning and inverted in the sunlight until warted.

4th—This requires cleanliness and good health on the part of the attendants and milkers, milking with clean clothes on, and special attention

For Any Chance Or Emergency

The .35 Remington-UMC Sporting Cartridge will stop the biggest game. Remington-UMC .22 Short is the best small calibre cartridge made. Between these extremes are several hundred different calibres of

Remington UMC

Metallic Cartridges

for all Standard sporting and military rifles. All gauged in the Arm for which they're made. 51 years success behind them. Used by experts. Endorsed by rifle-makers. Remington-UMC Metallics *guarantee your Arm* to the full extent of maker's guarantee.

Try This!

Ask your dealer to show you a Remington-UMC High-Power Rifle. Snuggle the stock into your shoulder. Draw a bead. See how "natural" the pump-action works. Get the "made to measure" feel of this clean-cut beauty. Then—you'll know how it feels to handle a REAL rifle—to own a World-Standard Arm.

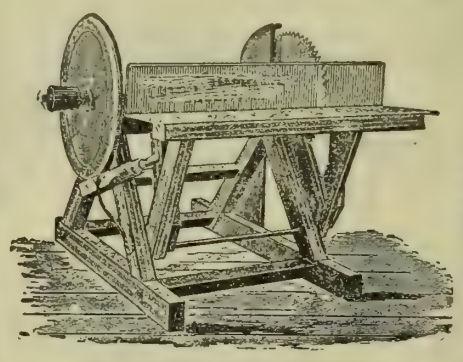
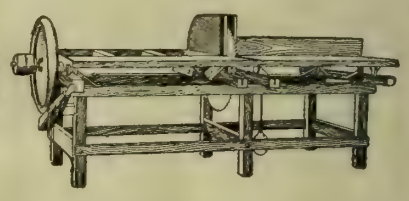
Sussex Wood Cutters Cut Expenses

Consult Our Quality Line Before Buying



Short Swing Wood Cutter

Wood Cutter Saws guaranteed at the right price. All sizes. Prompt delivery.



Flat Roller Table.

CONVENIENCE ECONOMY DURABILITY

are the three money-making qualities embodied in our Wood Cutting Machines. No frail parts to give out in a season's use. Built to last a life time. Frame is made of well seasoned birch, bolted and mortised; table of heavy steel plating in one piece.

Swing Table Machines built on skids, bearings supplied with compression greese cups. Especially adapted for use with gasoline engines. Made in four styles—Long Swing, Long Swing Improved, Short Swing, Flat Table.

Ask for our Catalogue and Prices, it will pay you.

Remember we also manufacture Trenholm Gear Hay Presses, Grain Grinders, Root Pulpers, Feed Boilers, etc.

The Sussex Manufacturing Company, Limited, Sussex, N. B.

should be given to the cleanliness of the milkers' hands and to their care to keep the hands dry when milking.

5th—Is the handling of the milk, which means its prompt and efficient cooling, and its storage at low temperature until needed. The accepted limit to which milk should be cooled is 50 degrees F.

Milk produced when the above requirements are observed, even in part, may entail slightly more labor than milk produced under less favorable and wholesome conditions, but it will well repay the cost in a superior article being placed upon the market and will eventually bring a higher price.

Cleanliness and cold are two factors that should be observed by every dairy man as milk produced in a cleanly way will contain fewer germs of contamination if kept cold until used many of these troublesome germs will have an unfavorable field in which to multiply and propogate, and as a result we will have a high class milk with a splendid keeping properties.

A THREE-HORSE EVENER.

The most convenient evener I have ever used is made as follows: Take a piece of iron 5-8- inch thick, two inches wide and 13 inches long. Put a hole in each end and weld links in, links four inches long and give them a quarter twist. For centre haul take one-third the distance between the end holes and weld link in six inches long and give one and a quarter twist. This makes this evener light, handy and complete. Doubletrees for the two horses to be five feet long. Put clevice through middle link to be hitched to whatever you may want to use. To plow or disk harrow, etc., set your evener perpendicular with short end down and put doubletree to lower end and singletree to upper or long end. The middle horse is hitched to the singletree. The evener always hangs level and not like the old-style three-horse evener with the doubletree to one end of a six foot pole.—Arnold Williams.

RUSTING OF IRON

Rusting of iron and steel is natural and unprevetnable, but it can be retarded in its rapidity of formation. On exposure to the weather iron combines with oxygen of the air and rust is formed.

Water (either as liquid or vapor) and oxygen must be present. Rusting is not merely the simple union of iron and oxygen but rust is the result of complex actions between iron, water, substances dissolved in water (as soil, dust, etc.), impurities in the iron, etc. In the changes occurring there are formed small electric currents between particles of the iron and of the other substances and oxide of iron results.

Some substances hasten rusting and others retard it. Those which aid are materials of an acid nature. Some forms of iron do not rust as readily as others. An iron which is worked well in its making and which is comparatively pure is especially resistant to rusting. Substances of an alkaline nature, such as quick lime, soda, potash, often inhibit rusting. A solution of potassium bichromate is especially good.—Raymond Hertwig.

The season of shortened daylight brings it own peculiar fire dangers. One of these is the use of the lantern about farm buildings. Of recent years, owing to competition, a low-priced lantern, which is a serious fire menace, has been placed upon the market. Instead of being securely screwed on the oil reservoir, the burner is simply sliped on, with the result that, if the lantern is upset, the burner comes off and the oil is allowed to run out upon the lighted wick. The result is either an explosion or a serious blaze, and unless speedily checked, damage to life and property.

Nervous & Sleepless

Take 2 Tablets at Bedtime and you will arise feeling Refreshed, Bright & Vigorous.

When you feel gloomy and depressed and cannot sleep, suspect your nerves. When you shrink from company and would rather be alone you are losing confidence in yourself, and that can only mean weak nerves. It is not natural to be solitary and unsociable, it shows clearly that vitality has become reduced, and the nervous system correspondingly weakened. But take Dr. Cassell's Tablets for such a condition and you will be astonished at the results, astonished at the bright new health you will gain, at the splendid vigour and vitality they will give you.

Mr. Poole, a business man of 60, Infirmary Road, Sheffield, England, says :—"I had lost all confidence in myself, and was actually afraid to meet people. The alertness and activity I had formerly possessed were gone. My digestion was feeble, and sleeplessness was terrible. But when I commenced taking Dr. Cassell's Tablets I soon felt better. Now I am as well and fit as any man of my age."

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative, and Anti-Spasmodic, and of great Therapeutic value in all derangements of the Nerve and Functional Systems in old or young. They are the recognised modern home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto; one tube 50 cents, six tubes for the price of five War Tax Extra, 2 cents per tube.

Sole Proprietors —Dr Cassell's Co., Ltd, Manchester, Eng.

POLLINATION OF FRUIT TREES

Observations and Experiments From 1904 to 1912

By W. J. Middlebrooke, From the Journal of Agriculture August, 1915

The theory of pollen sterility, i.e., the inability of certain varieties of fruit to fertilize themselves and produce fruit, has not yet been completely established. The few experiments that have so far been carried out have not proved that any particular pollen can be said to be absolutely sterile, and they can only be regarded as a preliminary to further experiments and research. Before the theory of pollination can be made of any practical benefit to the fruit grower, many more experiments, requiring much time and patience, must be carried out in a methodical and continuous series.

The magnitude of such an undertaking must be apparent. The facilities for carrying out experiments of this nature do not exist in private gardens or even nurseries, where other work must always be the first consideration; the work can only be successfully accomplished in a properly equipped research station by a staff of experts. The problem is rendered more complex by the ever-increasing number of varieties of fruits. To make a comparison of all the varieties in cultivation, each with the rest, would be an appalling task, and any attempt to conduct experiments on such a scale would almost certainly be unsuccessful.

It is admitted that some varieties produce pollen more potent than any other varieties of the same kind; it is also admitted that the mixing of the varieties is beneficial in securing larger crops, and that being so, we have a very good foundation on which to build future research schemes and experiments. The first step is the collection of evidence to determine the most prolific varieties, i.e., those which are likely to give the best results when used for pollination purposes; the next, to test the potency of the pollen of these varieties on shy-bearing varieties. The latter are in a minority, but unfortunately, include some of the best flavored and highest quality varieties, such as the Ribston Pippin apple, which would become valuable to the market grower if an average crop could be secured.

It is the unsatisfactory cropping of many varieties of fruit that has led to the investigations into the relative potency of the pollens of different varieties. Sterility cannot be attributed to close in-breeding; most of the varieties of fruit trees in cultivation originated in chance seedlings, the parentage of which is unknown, and little effort has been made to produce strains or fixed types of fruit trees as in the case of flowers and vegetables. Neither can sterility always be attributed to impotent pollen; many other agents may be responsible for the destruction of fruit crops during the flowering period.

The interest of the writer in the problem was awakened in the spring of 1906, in consequence of some failures, and partial failures, in securing satisfactory crops of fruit on some special varieties, on trees grown in pots for exhibition purposes. The failures occurred only with a few varieties, some of which were most desirable for exhibition, on account of their handsome appearance and good quality. At that time the pollination was carried out by means of hand brushes, the pollen being collected without regard to the selection of any special varieties. This system of pollination being only partially successful, further observation and experiments were made. Pollen was selected from a number of varieties of a decidedly free-bearing and free-setting nature. While doing this it was noticed that some varieties produced a much greater quantity of pollen than others. These freely pollen-producing varieties were extensively used for pollinating purposes with a conspicuous success which gave an impetus to further experiments, on a larger scale with a larger number of varieties. The succeeding experiments were carried on in a more methodical manner, and the results were recorded for reference, with a view to the revision, if necessary, of the varieties to be used in fustage of the experiments. At this ture pollen experiments. At this stage of the experiments the system adopted for the collection of pollen was to use one brush for one variety, labelling the brush with the name of the variety from which the pollen was taken; the pollen was then applied to the varieties chosen for the application of this particular variety of pollen, the pollinated tree being labelled with the same name as the brush containing the pollen.

Pollination by Bees.—In 1910 a stock of bees was introduced into the orchard house where the trees were grown for half the season, that is through the flowering period, until the fruit was three-parts matured, when the trees were transferred to the open air to finish. The bees were introduced mainly for the purpose of pollinating curarnts and gooseberries, it being found impossible to do this effectually by artificial means. The bee experiment was also a failure as far as the currants and gooseberries were concerned; the bees ignored them, and preferred to feed on the honey remaining in the hive. The bees were allowed to remain in the orchard house until the other kinds of fruit trees flowered, a portion of the trees being left unprotected for them to work upon in order to ascertain what results bee pollination would show. The results of bee polliantion were not nearly so good as those obtained by artificial pollination, but this may have been due to the too many kinds of fruit being in bloom at nearly the same time. Apricots, peaches, and nectarines were the first to open flowers, and the bees worked among them well, until the cherries and plums came into flower, when they preferred the latter and letf off working the former; the same thing happened when the apples and pears came into bloom. From observations made during the experiment, it was clearly shown that the bees worked newly opened flowers for honey collection, and they did not appear to collect pollen at the same time; pollen was apparently collected separately, or by special bees. It was noticed that when alighting at the entrance to the hive, some of the bees were loaded with pollen, while others had none so far as could be seen.

Very few insects visited the flowers, and in all probability did little, if anything, towards distributing pollen. Exception must, however, be made with regard to bumble bees, a number of which were continually at work; a small dark-colored species of bumble bee appeared very early in the season, and worked incessantly during periods of sunshine, and often on dull days when the atmosphere was warm. These small bumble bees began work earlier in the day than the hive bees and continued working later at night; they did the work of pollination very effectively. Flowers which were marked as being visited by the bumble bees were found to be effectively fertilized, the flower petals falling two days after their visit. The bumble bees did not apepar to collect pollen and carry it away, but a small quantity of pollen adhered to their legs and the hirsute covering of the lower parts of their bodies, thus ensuring cross-pollination.

Pollination was most effective on days with intervals of clouds and sunshine (typical April weather) with a warm and slightly humid atmosphere. On dull, cold days and abnormally hot days pollination was ineffective. The rapid evaporation on hot sunny days caused the foliage to flag, and the flowers to become limp, with the result that the vitality of the trees was lowered for the time being, and the trees prevented from performing the necessary functions for effective fertilization.

Pollination by Wind.—Experiments on pollination by wind were also tried; the wind was simulated by the use of bellows, and by shaking the trees. This method of pollination prdouced good results; it was also noted that out-door fruit set more freely with gentle breezes of wind and ocacsional showers of rain, and a sufficiently warm atmosphere.

The trees for test purposes were isolated by means of muslin screens on a framework of light canes. Suitable trees of small size were selected for the purpose, and a uniform number of fruit buds were left on each tree. As the flowers opened the anthers were removed from those to be fertilized, thus ensuring a correct test. The pollen was applied as soon as the flowers were sufficiently developed and the female organ in a receptive condition.

Value of Results Obtained.—The results of these experiments were very successful from a practical point of view, as only about 5 per cent of the trees failed to set a sufficient quantity of fruit for a crop, and no trees were entirely barren.

The tabulated figures given in the original article plainly indicate that there is greater possibility of securing good average crops of fruit where a number of different varieties are grown in proximity to each other.

It has been the practice of commercial fruit-growers in recent times to plant large blocks of one variety which makes a good price in the market. In doing so they have overlooked the possibility of loss of crop from ineffective pollination. In the county of Kent it is the custom to plant two rows of male hops, for the double purpose of protection from wind, and to fertilize the female or fruiting hops. Growers also plant filberts among cob nuts to assist in the work of pollination, the filberts producing a greater profusion of male catkins than cub nuts and a better crop of nuts is ensured. Yet they have overlooked the necessity of doing the same thing with fruit trees. The policy of planting large blocks of one variety of fruit has no doubt necessitated the regrafting of large acreages of apples and pears, the grubbing up and replanting of many acres of plums, and the discarding of many excellent and valuable varieties of all kinds of fruit.

The figures given in connection with this article cannot be regarded altogether as final ,but only as a step in the right direction of obtaining satisfactory evidence of a anture which will be of practical value to the gorwer. To obtain full and satisfactory information on this subject it is desirable that future experiments should be conducted in the open air under natural conditions.

(Continued on Page 225)

Choose Your Breed and Stick to It

How a Charlotte County Farmer Built Up a Herd of Producers.

While on a recent visit to the pretty border town, St. Stephen, the Editor of the Maritime Farmer asked a prominent business man of that thriving town: "Who is one of the most progressive farmers in this vicinity?" "I believe Mr. Helon Todd, of Milltown, is one of our best and most progressive farmers," was the reply.

The name, Helon Todd, sounded rather familiar to us and very soon we recalled that while conversing one day with Mr. Fred E. Sharp, the Clydesdale breeder, of Midland, N.B., he had referred to a visit he had paid to the farm of a Mr. Todd, of Milltown, where he had seen a fine herd of Jersey cattle. Mr. Sharp had been so taken with the well developed, thrifty, milky appearance of the herd that he had come to think and talk as freely about the merits of a good Jersey as he does of a good Clydesdale. So enthusiastic was Mr. Sharp over the merits of the Todd Jersey herd that the infection spread to ourselves and we decided that when next time we had occasion to go to St. Stephen we would visit Mr .Todd's steading. On inquiry we learned that Mr. Todd's farm was only a few minutes' walk from the street car line near the Milltown Mills. In a few minutes we boarded a car in company with a St. Stephen friend who volunteered to act as our guide.

We soon arrived at the Todd homestead, where we found Mr. Todd in his well appointed dairy preparing to separate the golden cream from an array of well filled pails of milk that had just been taken in from the stables.

It was a pleasure to watch Mr. Todd at work in his dairy, where the operator and all his surroundings were as spick and span as could be. It was also a delight to see how conveniently aranged and well equipped the dairy was.

The dairy is located in an ell adjoining the kitchen. The equipment consists of a small upright steam boiler, about 2 feet in circumference and 4 feet high, a steam turbine driven cream separator, a small power churn, a jacketed cream ripening vat so built that by opening a small valve, steam from the boiler comes in contact with the outside of the cream container and heats its contents to the proper degree of temperature. There is also an ararngement whereby cream may be kept sweet and cool in warm weather. There is also a large sink with hot and cold water on tap and a tank where a large quantity of water may be heated in a very few minutes by opening a valve that allows live steam from the boiler to diffuse through it. Mr. Todd is a great believer in hot water, and lots of it, for keeping his dairy utensils in a perfectly sanitary condition. After being thoroughly scoured with water and brush the butter worker ladels, etc., are carefully covered with cheese cloth to further protect their cleanliness until they are again used.

There are no filthy, germ laden strainers in the Todd dairy. The strainer consists of several thicknesses of cheesecloth which is placed over the separator tank and held in place by two grooved pieces of maple wood. The cheese cloth is thoroughly washed and the two pieces of wood are scoured when the other utensils are being cleaned after each milking.

The cream is sold to the ice cream parlors of Milltown and St. Stephen and the skim milk goes to develop a thrifty bunch of calves. Surplus cream is made into butter which finds ready sale in the nearby town. The water used in the dairy and for the stock is piped in from an acquaduct whence it comes by gravity.

Mr. Todd's plan is to light a fire with good dry wood under his boiler before he goes to milk his cows and when the milking is completed the boiler steam is up to the required pressure. A valve is opened and around goes the separator bowl. The milk is strained into the separator tank, the speed indicator is examined and as soon as it indicates that the bowl is turning the specified number of revolutions per minute, the milk is allowed to flow and very soon the golden stream is trickling into the receptacle.

THE TODD HOMESTEAD, MILLTOWN, N.B.

HELON TODD'S JERSEYS AT PASTURE

After Mr. Todd had completed his work in the dairy he conducted us to his stables where we saw his splendid Jersey herd. The various individuals in the herd are particularly well developed, possessing abundance of vigor, and constitution enough for some of the larger breeds. The whole herd is uniform in type and it is a pleasure to see young calves so well developed that they look like yearlings, yearlings that look like two-year-olds and two-year-olds that look like mature cows. Each and every animal in the herd was dehorned in calfhood by the application of caustic potash to the embryo horns and this helps to give the herd its characteristic uniform appearance.

Mr. Todd says that after following the dehorning system for many years he would not think of keeping a horned animal in his herd. The process is so simple and takes so little time that it does not pay to put up with the bullying that goes on among cows that are not dehorned. There is always more or less trouble and loss from bruised and torn udders in herds where the cows are not dehorned. There is always a tyrant that wants to be boss of the herd and who is ever ready to push and poke whenever they get a chance.

The well developed condition of the herd is due to the master hand of the feeder, and lots of skimmilk while the calves are growing to cowhood.

The story of the origin of the herd is as follows: About fifty or fifty-five years ago Mr. Todd's father asked the captain of the steamer plying on the St. Croix River and between the Islands in the Bay to buy him a heifer calf on the Island of Campobello, where there were some particularly fine Jerseys that had been imported from the Channel Isles. Mr. Todd does not know who imported them or who bred them and consequently no trace of the registry of the calf can be found. Neither Mr. Todd nor his father ever purchased any other females so that each individual in the present herd is a descendant of the calf purchased over fifty years ago. Jersey bulls have always been used on the herd. During the last ten years Mr. Todd has been using bulls imported from Hood Farm, Lowell, Mass.

Mr. Todd has only thirty acres of arrable land and as he keeps about thirty head of stock, he is keeping an average of one Jersey per acre. He raises all the roughage, hay and roots required for feed and he purchases all the grain feeds including liberal quantities of cotton seed meal.

All the crops raised on the farm are fed on the farm. Cream, butter and surplus cows are the only products sold off the farm.

A rotation of crops is followed and each year one of the mowing fields is used for pasturing the stock. The herd were on rough pasture only eight days last summer.

Very fine sawdust from a box factory is used for bedding and enough is used to absorb all the liquid manure, which is in this way saved for wages are paid and town hours are observed.

He has to compete in the open labor market for the necessary hired help which is secured in the town. Town the use of the farm crops and heavy bills for commercial fertilizers are avoided. We know many farms where a great deal of money could be saved by following Mr. Todd's plan for conserving liquid manure.

The stalls are arranged so that the cows are lined with the gutter by means of a movable rack in each manger. The rack is moved back or pushed ahead to suit the length of the rspective animals. Consequently every animal is kept as clean as clean can be.

The young herd is increasing very rapidly and usually Mr. Todd has some very choice individuals for sale. Long years of selection has brought the herd to a high average as producers and although they are not registered they are as nice a herd as we have seen for many days.

What Mr. Todd has been able to accomplish in building up a high grade herd may be done by any farmer who will consistently stick to the breed of his choice for a number of years and who will not withhold his hand in the feeding of his young stock.

CORRECTION

Craig Bros., Amherst, N.S., have just called our attention to the fact that they won first prize in the pullet mating of the Barred Plymouth Rock class. Inadvertently this winning was credited in our issue of December 21st to Watson Lutz, Moncton.

Agricultural Short Courses on P. E. I.

The Department of Agriculture has arranged to hold a series of courses lasting for three to five days in a place, and reaching as many points as possible during the winter months. These are not to replace the regular two weeks' course in Live Stock and Seed Judging usually held in Charlottetown and discontinued this year due to the use made of the building by the soldiers, but to supplement it when normal is again regained. The theoretical in agriculture will be brought near to the practical. Lectures covering Live Stock, Poultry, Grains, Weed Seeds, Soil, Drainage and Co-operation will be given by the members of the Provincial and Dominion Departments of Agriculture. Demonstrations in stock judging will be held whenever possible. Lantern lectures will supplement the lecture work in live stock.

The first course will be held at Palmer Road comemncing January 10th, and on January 17th, a second one will be opened at O'Leary. Others will be held at Souris, Montague, Murray River, Hillsboro (in the Consolidated School) and at other points to be arranged.

Seed Fairs are held annually at some of the above mentioned points—the agricultural course and seed fair will be held during the same week at every point if suitable arrangements can be made. Efforts are being made to induce all the young men to attend.

Available Phosphoric Acid vs Available Phosphates

We wish to call the attention of the readers of the Maritimo Farmer to the advertisement of the Cross Fertilizer Co., of Sydney, N.S., which appears on the inside front cover of this issue.

The reason why the advertisement in question is published in the Martime Farmer is not only as a protection to a legitimate brand of goods, but also to warn the farmers of the Maritime Provinces that misrepresentations are rife. The writer of this article has been shown correspondence that backs up the statements made in the ad. He has also seen corerspondence from parties who have evidently purchased low grade slags just because they did not understand the difference between the terms "available phosphoric acid" and "available phosphates."

Anent the slag situation a prominent business man, who is in close touch with the problem says: "Under war conditions, Basic Slag, in the old country, has advanced in price about 30 per cent. This applies to basic slag of recognized quality, viz.: 10 per cent. or over of soluble phosphoric acid.

Freights, war-insurance, etc., are now trebled in price. It is therefore impossible for any company to import a slag of but only the very lowest grades. It is these lowest grades only that are being offered overseas this year, as the quality is so low that the farmers of the United Kingdom will not purchase if a better grade is available. So the over-seas markets are bare of only the low grades and this furnishes an opportunity for anyone to purchase these at a low price.

But with the freight and insurance added (about $8.00 per ton) it makes an expensive article. It is not reasonable therefore, that phosphoric acid can be bought as cheaply in this way as in a standard article of slag.

The principal plant food contained in Basic Slag is phosphoric acid.

The value of Basic Slag therefore depends upon:

1. The total percentage of phosphoric acid.

2. The percentage of phosphoric acid soluble in a 2 per cent. solution of citric acid. (Citric acid being much like the acids in soils as well as the acids secreted by plant roots.)

3. The fineness of grinding.

In 1909, Prof. M. Cumming of the N. S. A. C., Truro, in his report, warned the farmers of Nova Scotia as follows: "Farmers should familiarize themselves with the facts and should pay for the basic slag they buy prices varying with the amount of phosphoric acid contained. There has been altogether too much low grade slag sold at high grade prices. If a man buys a low grade slag he should pay a proportionately low price for it. In buying slaig one should always demand the analysis and be governed accordingly."

It is recognized by all agricultural authorities on agricultural matters that the amount of stable manures annually accumulating on the farms in the Maritime Provinces are not sufficient to enable the farmer to cultivate and keep in good condition all he is now able to work, since the introduction of modern farm machinery. He is therefore obliged to purchase artificial fertilizers to supplement his manure pile.

The need for artificial manures being recognized, the farmer will do justice to his farm and his pocket book if he pays particular attention to what is being supplied by the manufacturers of fertilizers. Since fertilizers are to supplement or take the place of stable manure they must contain the same elements of plant food.

These elements are: nitrogen, phosphoric acid and potash.

Potash hovering in the vicinity of $500 per ton and almost impossible to get even at that price will not be used very extensively by the farmers of the Maritime Provinces this year. They must look well to their ash barrels, cultivate their fields thoroughly and depend on the potash supply that exists in their soils.

Nitrogen, which is in normal times, the most expensive form of plant food the farmer has to buy, is also abnormally high this year and lucky is the farmer who has his fields well tilled and who gives the legumes a prominent place in the rotation.

Phosphoric acid, the other element will be the most in demand this year, and will be supplied in the form of bone meal, basic slag and acid phosphate. The last two are the main sources.

Nature deposited phosphates in rock deposits in Canada, South Carolina, Florida and Tennessee. The produce of these rocks when ground and treated with sulphuric acid is called acid phosphate or super-phosphate. Nature also deposited in the rocks at Belle Isle, Nfld., iron and in these rocks there is also a percentage of phosphates which must be eliminated from the iron ore in the manufacture of steel. Under the superheated condition of the iron furnace these phosphates combine with lime to form what is known as four lime phosphate. A four lime phosphate is not soluble in water but a considerable portion of it is soluble in dilute vegetable acid, such as exist in the soil.

In a ton of high grade slag there are from 250 lbs. to 300 lbs. available phosphoric acid. The farmer should therefore note particularly that it is impossible to buy pure phosphoric acid —it is usually purchased in some form of phosphate of lime.

We wish to warn our readers against any misrepresentation that some ignorant or designing agent may try to put over when he tries to sell slag under a guarantee of "available phosphates." These words resemble the words "available phosphoric acid" and are often so cleverly quoted that in some cases farmers, not intentionally, have bought basic slag on the guarantee of "available phosphates" although the law requires a guarantee of "available phosphoric acid."

Don't buy a slag represented to you as containing 16 to 20% available phosphates and pay as much for it as you would for a slag containing 10 to 14% Prosphoric Acid. If you do you are paying too much for it because it only contains from 8 to 10% phospheric acid.

You would not be willing to pay as much for 8 or 10 barrels of a certain grade of flour as you would for 10 to 14 barrels of the same grade. Neither should you be willing to pay as much for 8 to 10 units of phosphoric acid as you would for 10 to 14 units of the same commodity.

The Short Courses at Sussex and Truro

SHORT COURSE OPENS AT AGRICURTURAL COLLEGE

The short course at the college of Agriculture, Truro, commenced on January 3rd, with an attendance of over one hundred, which, despite war conditions, is fully up to the initial attendance at any of the previous short courses. There are several students from Yarmouth county, upwards of forty from Cape Breton counties, and a very considerable number from the remaining counties of the Province. The poorest representation this year is from the fruit growing counties, probably owing to the fact that returns from the orchards were not as satisfactory as could be hoped for. The initial classes of the judging of beef cattle was taught by the principal, who will continue instruction in this subject during the day. The evening lectures will be delivered on plant diseases and insect pests by Professor Smith and Brittain.

The classes are in full swing, and all the students are looking forward with interest to the opportunity of studying the wonderful cows which are now housed in the stables at the college farm. Among these is the great Holstein cow, Victoria Calamity Clay, that ahs in less than one year given to date over 22,000 pounds of milk exceeding by several thousand pounds, the record for Maritime Canada. Recently a milking machine has been installed at the college, and naturally the students in attendance at the course are greatly interested in watching this modern device.

Perhaps the subject which is being talked about more than any other is the use of lime stone on Nova Scotia soils, which is being dealt with. Araringements have been made with U. H. Kenedy, M.P.P., who has purchased a lime pulver, to have the same in operation on the college premises for several days, and lectures on the subject will be given by Professor Harlow, the chemist, and Professor Trueman.

In the women's short course which is being conducted concurrently in the new science building, the enrollment for the first session was twenty-five, but a large influx of students is expected during the ensuing days. The facilitiês provided in the new building have made it possible to offer a most attractive course in domestic science and the allied subjects. By next week, when the Womens' Institute Convention will be held, it is expected that the ample building will be tested to its utmost to accommodate the numbers who purpose attending.

THE SUSSEX SHORT COURSES

Among the subjects that will be discussed at the Sussex Agricultural School classes from January 11th to 21st will be:

Orchard Planting, Varieties of Apples and How to Judge Them, The Care and Renovation of Old Orchards, The Care of Young Orchards, Apple Packages and Packing, Weeds and Their Control, Apple Diseases, The Value of Leaves, —by R. P. Gorham.

Beekeeping, Land Drainage, Fertilizing Materials, Home Mixing of Fertilizers—by H. B. Durost.

Production of Clean, Wholesome Milk, Care and Ripening of Cream and Butter Making, Private Dairy Versus Co-operative Manufacture, Cream Separators and their Operation. Milk Testing with Demonstration of Babcock Test.—by C. W. McDougall.

Record Centre Work.—by H. N. Flewelling.

Poultry House Construction, Artificial and Natural Incubation, Breeding and Feeding for Winter Egg Production, Poultry Breeds and Summer Care of Chickens, Killing and Dressing of Poultry.—by Seth Jones.

Small Fruit Culture, The Home Vegetable Garden.—by O. W. Wetmore.

Dairy Bacteriology, Preparation of Sprays, Potato Disinfection and Treatment of Grain for Smuts, Club Root of Turnips.—by G. C. Cunningham.

Oats, Wheat, Seed Selection, Potato Judging and Seed Selection, Corn and Soiling Crops, Grasses, Clovers, Seed Selection, Turnips and Root Crops, Judging and Selection of Roots,—by S. J. Moore.

Judging Beef Cattle, Judging Horses, —by W. W. Hubbard.

Judging Horses, Crop Rotations, Judging Sheep,—by W. W. Baird.

Cultural Methods, Dairy Cattle, Judging Dairy Cattle, Judging Swine, —by Prof. J. M. Trueman.

Entomology—by Wm. McIntosh.

If you can spare the time to attend the entire course it will be the best investment of time and money you ever made. No fees.

The Teachers' Winter Short Course in Nature Study and Elementary Agriculture which was held in Sussex last week was very successful.

One hundred and seven students were enrolled. Although only 100 were asked for, applications were received from some 350 who desired to attend.

Mr. R. P. Steeves, who had charge of the work, had a well arranged program prepared. Competent instructors were present and the teacher-pupils were kept busy every minute. They have all returned to their schools carrying with them the germ of enthusiasm in agricultural matters and undoubtedly they will all be better prepared to cope with the problem of nature study than they have ever been before.

Agricultural Confrence.

The heads of the agricultural departments of Nova Scotia, New Brunswick and Prince Edward Island are meeting at the N. S. A. C. on Wednesday, July 12th to confer on matters of joint interest. Dr. C. C. James will be present and one of the subjects that will come up for discussion will be "Agricultural Education."

Hon. J. A. Murray, Minister of Agriculture, for New Brunswick, will be one of the speakers at the opening of the new Science Building, Truro, on January 11th.

OMISSION

In our official list of prize winners at the Maritime Winter Fair, which was published in our issue of December 21st, Mr. Burdwin Goodwin's winnings in the ewe lamb section of the Oxford Down Sheep Class was inadvertently omitted. Mr. Goodwin won first, second, third and fourth prizes on ewe lambs.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; inches—First insertion $2.25.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME FARMER, or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

Toronto Representative—J. Lester Davis, Miln Building 8 Johnson Street.

Montreal Representative—Dakers Cameron, St. Nicholas Building.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

JANUARY 11, 1916.

DATES OF ISSUE.

March	7-21
April	4-18
May	2-16
June	6-20

FARMERS AND THE BANKS.

The estimation in which the business of farmers generally is held by the banks may be judged from the following extract taken from "The Manual of Canadian Banking," by H. P. Eckardt, a standard work on the subject:

"The kind of business the manager will be called on to transact will depend on the kind of district in which his branch is located. The majority of the country branches are located in the prosperous agricultural districts. In them there are considerable dealings with farmers. There is much variety in the business of the various agricutlural branches. A branch in an Ontario town, for example, will contrast sharply with a branch in a Manitoba or Alberta town. In the East, the bulk of the farmers' business consists of deposits; in the West it consists of loans. Wherever it is the farmers' business is highly prized. Taking the farmers as a whole, it can be said that they do not use the bank's capital—they furnish deposits to equal or more than equal their borrowings. The dealings of the bank with them, therefore, consist in its turning over their money at a profit. Moreover, loans to farmers, when properly made, comprise one of the safest of the banks' investments, and cause probably less anxiety and trouble than any other class of loan.

'Of the other classes of dealings there are many where the opposite of this is the case. It cannot be said that manufacturers do not use the bank's capital; they do, and most extensively. The amount of loans to manufacturers far overbalances the deposits received from them. And quite frequently the loans are difficult to handle and occasion much trouble and anxiety.

"Those who have been most successful in dealing with farmers exercise care not to let their loans exceed the surplus liquid assets of the borrowers. They avoid making advances that will be regarded by the borrowers as something that can run on indefinitely—like a mortgage. They require a clearing up of liabilities every year.

"The notes offered by farmers are usually endorsed, one good farmer backing another, or else notes secured by produce shortly to be sold. In the East the loans are not usually large enough to be especially referred to head office, but in the West they are on a larger scale. Loans of the big farmers there not infrequently amount to one or two thousand dollars or more before their liabilities are cleared off through sale of produce or livestock.

"Then there are the accounts of the produce and livestock buyers. They require advances of the bank's money to enable them to pay cash for what they buy. The advances are usually for short dates, and are secured by endorsed notes, or by pledges of the commodities bought. These men, especially the livestock buyers, are expert traders, and pretty keen on getting horses, cattle, etc., from the farmers as cheaply as possible. As a rule they are careful of their reputation at the bank and do not try to get ahead of it. For all that, the loans have to be carefully watched."

START MEETINGS ON TIME.

Now that the season for annual conventions of agricultural societies is at hand, it behooves officers and members to make use of every minute. Some societies have acquired a reputation for starting the meetings on time. Likewise, the leaders make the sessions throb with interest every moment of the meeting. On the other hand, some associations are decidedly slow in the conduct of their meetings. Generally the sessions are all too short as it is, and every moment counts. If the members know the meetings will begin at the scheduled time, they are not going to lose out by being late. The prompt start of each session does much to give the meetings spice and snap throughout. It is courteously suggested that officers and members alike do their utmost to bring this about. The same truths apply equally well to the multitude of small farmers' meetings that are held during the winter months.

ARE YOU ONE OF THESE GIRLS ?

There are many girls who try to shun all household duties, and, beyond making themselves neat and attractive, are utterly useless. Every girl ought to be eager to lift some of the burden of household management from her mother's shoulders on to her own; but unfortunately some of them are so averse from labor that they wait to be asked to do things instead of being constantly on the look-out for little duties which they are capable of doing. If girls would be of any real use in the home they must be quick to notice what is wanted—the room that needs dusting, the flowers which require rearranging, the curtain which has lost a ring, and is therefore drooping. And then they must not only be willing to do it pleasantly, without making people feel that they are suffering martyrdom.

THE BUSY MAN'S CREED.

Elbert Hubbard says:

"I believe in the stuff I am handing out, in the firm I am working for, and in my own ability to get results. I believe that honest stuff can be passed out to honest men by honest methods. I believe in working, not weeping, in boosting, not knocking, and in the pleasure of my job. I believe that a man gets what he goes after, that one deed done today is worth two deeds tomorrow, and that no man is down and out until he has lost faith in himself. I believe in today and the work I am doing, in tomorrow and the work I hope to do, and in the sure reward which the future holds. I believe in courtesy, in kindness, in generosity, in good cheer, in friendship and honest doing something for every man ready to do it. I believe I'm ready—RIGHT NOW.

MR. MICAWBER ON THRIFT.

There is a valuable lesson for farmers, as well as other people, in the dictum on the subject of thrift which Dickens puts into the mouth of that most famous of all unthrifty characters, Wilkins Micawber. Micauber, in the midst of one of those trying seasons of "financial difficulties" which so often marked his career, declared to his young friend Copperfield that he had nothing to give but advice. His first warning was against procrastination. The narrative proceeds:

"My other piece of advice, Coperfield," said Mr. Micawber, "you know. Annual income, twenty pounds, annual expenditure, nineteen pounds nineteen and six; result, happiness. Annual income twenty pounds, annual expenditure twenty pounds ought and six; result, misery. The bloom is blighted, the leaf is withered, the God of day goes down upon the dreary scene, and—and, in short, you are forever floored. As I am."

Scrub dairy bulls are good runners—they run the herd down.

The man who thinks that a dairy cow can rough it and still be a profitable milker has some things to learn about cows. No animal shows the bad results of neglect quicker than a good cow. And none responds more fully to good care, good feeding and kind treatment.

Is there any person in your immediate vicinity who knows just what to do at once in a case of a very bad wound to a neighbor, a broken bone or a case of poisoning? In every school district there should be two or three persons who are well qualified to give "first aid." If you are a bright young man or woman, no one could be better qualified than yourself to take up the study.

Health is one of the geratest factors of success. The ability to do a good, full hard day's work is a prime requisite of business with clerk or proprietor. To "peter out" early in the afternoon means, to a young man the certain knowledge that something is radically wrong with him. Late hours, cigarettes, too little exercise in the open air—or a combination of several "little things" are having their effect on him. He should buck up and cut them out if he would be mentally and physically fit to do good work.

"Every clerk should be the understudy of the man above him. Could you step into Brown's shoes if he were suddenly called away for a week? Could you carry on his work to the satisfaction of the boss if typhoid kept him away for two or three months? The clerk who flounders and is perplexed when unexpectedly confronted with a situation he ought to be prepared for, is not the man who is headed for the boss's chair." The above is just as applicable to the farm boy as it is to the clerk.

Pollination of Fruit Trees.

(Continued from Page 221)

From the tabulated figures given, a casual observer, unacquaitned with this kind of experimental work, may think that the average results obtained show a very low percentage, but as a matter of fact the percentage was higher than was anticipated or could be expected, seeing that every flower in each truss of bloom was taken into account. No thinning was carried out, as this would have led to exaggerated results. The average number of flowers in a truss of the different kinds of fruit as roughly as follows: Apricots, 3 to 5; apples, 5 to 7; cherries, 15 to 26; nectarines and peaches, 2 to 5; pears, 9 to 12; plums, 3 to 9. Apricots, nectarines, and peaches produce a quantity of flowers singly, disposed alternately on the shoots or at intervals between triple buds, the centre being a growth bud. On extra vigorous shoots three to five flower buds are formed in a cluster round a growth bud. It will be seen from the number of flowers contained in a truss or bunch that it is impossible or unlikely that every flower will set and develop fruit; it was invariably found that the first flowers of a truss that opened were fertilized and began to swell immediately, while the remaining flowers of the truss although they may have been duly pollinated, did not swell; the stalk and embryo fruit turned yellow and fell off.

The number of fruits developed on each truss varies with the variety. In apples the small and medium-sized fruited varieties matured the greatest number per truss, sometimes producing as many as six fruits in one cluster; the large fruited varieties rarely retained more than one or two fruits in a bunch, although sometimes three were matured. Pears, except some of the larger fruiting varieties, which rarely matured more than three in a cluster, carried more fruit per bunch than apples. Cherries and plums are more variable than apples and pears, in favorable seasons the amount of fruit set and retained was enormous, and required considerable thinning, otherwise the fruit was small and the trees were impoverished.

Experiments with Cider Apples.—Experiments with the pollen of cider apples were made, but not on a large scale; the results were satisfactory in the majority of tests. Observations made in connection with orchards of cider fruit and mixed orchards, in the county of Hereford, showed that cider varieties cropped more heavily and with greater regularity than culinary and dessert apples, and that, where culinery and dessert apples were intermixed with cider apples, better crops were obtained. One instance may be mentioned. In an orchard at Cubberly, near Ross, the following apples were growing among cider apples, viz., Blenheim Orange, Bess Pool, Ribstone Pippin, Catshead, and several other varieties, all of which were heavily laden with fruit, the fruit hanging on the branches like ropes of onions, bending the branches until the tips of them touched the ground. Similar results were noted in orchards all over the country where other varieties had been planted among cider varieties.

From observations and experiments made, it is sugegsted that, at any rate in grass orchards with standard trees, cider varieties planted among culinary and dessert apples would have a beneficial effect on the cropping of the latter. Cider varieties worked on Paradise stocks could be tried in plantations of bush trees. The varieties of cider apples experimented with were early flowering varieties; the bulk of cider apples flower late, consequently they would not be serviceable for the pollination of the majority of culinary and dessert apples.

The following varieties of early flowering apples were tried and are recommende; the flowering period is indicated in brackets; Bedan des Parts (April), Cherry Hereford (middle May) De Boutteville (early May), Eggleton Styre (middle May), Handsome Hereford (middle May), Medaille d'Or ,early June), Rouge Bruyere (early May), Sam's Crab (April) (a good dessert eaten from the tree), Skyrme's Kernel (end of May), Strawberry Hereford (middle May), White Hereford (early May). All the above-mentioned varieties are extremely prolific.

Form of Fruit Tree Suitable for Pollination Experiments.—The best form of tree for pollination experiments is the single cordon, which should be grafted, or better budded, on suitable stocks. Single cordon trees occupy less room than pyramids or bush trees; they are mostly protected and isolated, and much easier to manipulate, either as pot plants or grown in the open ground. The apple should be worked on the broad-leaved English Paradise, pear or quince, and some varieties double grafted; plums on common plum and broad-leafed Mussel; and apricots on Brussel, Brompton, and Broad-leaved Mussel. Some varieties of stone fruit do better on one stock than another; it is therefore important that each variety should be worked on the stock best suited for it.

ults were obtained by placing the bushes in a position where they were more exposed to wind from the ventilators, and where a cooler temperature could be obtained. No difficulty was experienced with them when grown out of doors, except that they required protection from the frost.

(In the article in the British Journal of the Board of Agriculture a number of tables are given, showing results obtained with different fruits by cross-pollination as compared with the pollination by the varieties' own pollen and mixed pollen taken from various varieties indiscriminately.)

Nomenclature of Seed Grain.

Editor the Maritime Farmer:

Herewith I attach nomenclature of grades of grain for seed purposes which become effective December 1, 1915, at the government interior terminal elevators at Saskatoon, Moose Jaw and Calgary. The grain so graded will thereafter be available in the usual channels of commerce for grain.

It is not to be suposed that these grades of seed grain are comparable with selected seed grain that is pure as to variety, grown by expert seed growers, subjected to special screening and offered for sale at high prices. In rowed barley that is clean, of superior puality and reasonably pure as to variety or type of grain, so that such supply of grain may conveniently be made available to farmers, seed merchants or grain dealers who sell seed at the minimum cost; the main object is the improvement of field crops:

Therefore the Governor General in Council, under and in virtue of the provisions of Section 2 of the Seed Control Act, is pleased to order and it is hereby ordered as follows:

The nomenclature of grades of grain for seed purposes shall be as follows—the same having been revised and approved by the chief inspector of grain, viz.:

No. 1 Canada Western seed oats shall be composed of 95% of white oats, sound, clean and free from other grain; shall be free from noxious weed seeds within the meaning of the Seed Control Act, and shall weigh not less than 36 pounds to the bushel.

No. 3 Extra Canadian Western Seed barley shall be composed of the six-rowed variety, sound, plump, free from other grain, of fair color, free from noxious weed seeds within the meaning of the Seed Control Act, and shall weigh not less than 48 pounds to the bushel.

The above table has been compiled from The Maritime Farmer's official report of the Dairy Tests at the Maritime Winter Fair. We believe it will interest the respective exhibitors as well as all our readers who are interested in dairying, as it affords an opportunity to compare the records of the respective breeds in the respective years. °72 Hours. *48 Hours.

Experiments with grapes proved that, with the exception of Muscat Hamburgh, which showed a preference for the pollen of Black Alicante or Black Hamburgh, there was a tendency for the pollen of all varieties to set freely. The cause of bad setting in such varieties as Alnwick Seedling, Duke of Buccleugh, Mrs. Pince, Black Muscat, and White Muscat, was found to be the presence of a little drop of nectar hanging on the end of the pistil, which prevented the pollen from doing its work. The obstacle being removed there was no difficulty in securing a thickly set bunch of berries. The method adopted for the removal of the nectar ocstacle was to syringe the bunches early in the day with clean warm water at a temperature of 50° F. above that of the house in which the grapes were growing; the water was driven through the bunches with some considerable force, and was projected in as fine a spray as possible; later in the day, when the bunches were dry, the hand was gently drawn down the bunches, which were afterwards shaken. Pot vines treated in this way were exhibited with as many as fifteen good-size bunches, well packed with berries.

In the case of the currant and gooseberry tests under glass, the best resthese grades for seed grain it is rather the object to provide a commercial grain that is practically free from noxious impurities and may safely be used for seeding.

Car lots of grain that may require a dockage, in process of cleaning to make god seed, of more than two per cent in excess of the dockage fixed by the grain inspector for the regular grade of wheat, or of more than three per cent for oats and barley, may not be accepted for seed.

GEO. H. CLARK,
Seed Commissioner.

PRIVY COUNCIL, (P.C. 2261) Canada.
At the Government House at Ottawa,
Thursday, the 30th September, 1915.
PRESENT:

His Royal Highness the Governor General in Council:

Whereas it is deemed desirable in the execution of the powers conferred by Section 2, of the Seed Control Act that special grades of grain should be established exclusively for seed purposes without affecting, of course, the commercial grades fixed under the authority of the Canada Grain Act:

And whereas, the primary purpose of providing a special grade of grain that may be suitable for seed is to create a substantial supply of Red Fife and Marquis wheat, white oats and six-

No. 1 Manitoba Northern seed wheat shall be composed of 85% of Red Fife or 85% of Marquis wheat, sound, clean and free from other grain, and free from noxious seeds within the meaning of the Seed Control Act, weighing not less than 60 pounds to the bushel.

For seed purposes, Red Fife and Marquis wheat shall be kept separate.

No grain shall be accepted for seed which will require a large dockage to clean.

Seed inspectors shall observe the foregoing regulations in the grading of grain for seed purposes, nevertheless inasmuch as the operations of seed inspectors are dependent upon and follow after the operations of grain in-

spectors in respect of the grain to be examined as to suitability for seed purposes, the seed inspector of grain or his deputy in all matters of procedure and prompt attendance to duties and for efficiency and accuracy of technical work done seed-inspectors shall be responsible to the Minister of Agriculture.

Seed inspectors are authorized to certify ex-elevator the grain graded for seed purposes pursuant to the foregoing regulations.

(Sgd.) Rodolphe Boudreau,
Clerk of the Privy Council.

A Comparison of Tillage and Sod Mulch in an Apple Orchard.

A continuation of the studies at the New York Agricultural Experiment Station to determine whether the apple thrives better under tillage or in sod. The experiment summarized in this paper was begun in 1903 in an orchard of Baldwin trees. The tilled land was plowed each spring and cultivated from four to seven times. The grass in the sod plot was usually cut once, sometimes twice, all other operations being identical for all the plots.

The experiment was divided into two 5-year periods. During the first period the orchard was divided in halves by a north and south line, and during the second period by an east and west line. Thus, one-qaurter of the orchard was under tillage ten years; another under tillage 5 years, then left in sod five years, the third quarter was in sod ten years and the fourth in sod five years, then tilled five years.

The writer summarizes the results as follows:—

The average yield of the plot left in sod for ten years was 69.16 barrels per acre, that of the plot tilled ten years 116.8 barrels per acre, making a difference in favor of tillage of 47.64 barrels per acre per annum. The fruit from the sod plots was more highly colored than that from the tilled land and matured from one to three weeks earlier than the tilled fruit. The latter keeps from two to four weeks longer than the former and is also better in quality, being crisper, juicier and of better flavor. The uniformity of the trees under tillage was in striking contrast to that of the trees in sod, which lacked uniformity in every organ and function of which note could be taken. The grass had also a decided effect on the wood of the trees, as evidenced by the greater number of dead branches and the less plump and duller appearance of the sodded trees. The leaves of the tilled trees came out three or four days earlier and remained on the trees several days longer than on the sodded trees. Those on the tilled trees were a darker, richer green and more numerous, indicating greater vigor.

The effects of the change from sod to tillage were almost instaneous. Both tree and foliage were favorably affected before midsummer of the first year, and the crop, while below normal, consisted of apples as large in size as any in the orchard, the falling-off in yield being due to poor setting. The change from tillage to sod was quite as remarkable and as immediate, the average yield of the new sod plots being less than half of that of the tilled plots. The use of nitrate of soda in the sod plots greatly increased the vigor of the trees and was a paying invesment, yet for the five-year period the yield was only slightly more than half as much as that of the tilled trees.

The very marked beneficial effect on sodded trees of placing adjacent ground under tillage shows that the sod should not only be removed round the trees but also for a considerable distance from them.

The changes in the soil due to the two systems concern chiefly the amount of humus and nitrogen. It was found that tillage and cover crops conserve humus and nitrogen better than the sod-mulch treatment.

The pasturing of pigs, sheep or cattle on sodded orchards does not overcome the bad effects of the grass.

The average cost per acre of growing and harvesting apples in sod was $57.73 and under tillage $83.48, making a difference of $31.75. Subtracting these figures from the gross return, leaves a balance of $74.31 for the sodded plants and $140.67 for the tilled plots, or an increase of $66.36 in favor of tillage.

Plant Diseases.

"Phoma destructiva," the Cause of a Fruit Rot of the Tomato in the United States and Cuba."

In March, 1912, the Bureau of Plant Industry received from Cutler, Florida, specimens of tomatoes affected with a fruit rot, which was stated to have caused great loss among the farmers of Dade county, Flordia. Some of the fruits were green, some beginning to color and others ripe. Most of the green and ripe fruits were marked on the sides and at the stem end with slightly sunken spots, the surface of which was on the sides and at the stem end with slightly sunken spots, the surface of which was membraneous or crust-like, 1 to 3 cm. in diameter, brownish black in color, with definite outlines. Tiny dark pustules were observed on the surface of the largest spots. On the ripe fruit the diseased tissue was surrounded by a more or less watery zone.

Microscopic examination showed that the diseased tissues of both green and ripe fruits contained a dense network of mycelium, with numerous pycnidia apparently belonging to Phoma as well as bacteria and sometimes spores of Macrosporium. However, the abundance of pycnidia in all spots examined suggested that the Phoma is the primary cause of the rot and this fungus was therefore isolated from the diseased tissues. Almost two years later an identical Phoma was isolated from tomatoes from Cuba and Florida, showing a similar appearance.

With the cultures of this fungus, now more precisely determined as Phoma destructiva, Plowr., the writer carried out a long series of inoculation experiments on green and ripe fruits and leaves of tomatoes (Lycopersicum esculentum) under glass, on green and ripe fruits in the laboratory and on plants growing in the open air. The leaves of young and old plants were also inoculated with the cultures obtained from the fruits. Experiments were also conducted on the infective power of the fungus on egg-plants (Solanum melongena), the tubers and haulms of potato (S. tuberosum), sugar-beets (Beta vulgaris), Datura tatula, peas (Pisum sativum), beans (Phaseolus vulgaris) and pepper (Capsicum annuum.)

These experiments showed that Phoma destructiva behaves as an active wound parasite on green and ripe tomatoes, and that it causes the formation of spots on the leaves of tomatoes and potatoes. The Phoma was also isolated from the inoculated tomatoes under glass in the laboratory and in the open field. The behavior of the fungus towards its host and its cultural characteristic are minutely described.

Programme of the N. S. Fruit Growers Ass'n.

The Fifty-Second Annual Meeting of the Nova Scotia Fruit Growers Association will be held in the Opera House, Wolfville, on January 18th 19th and 20th, 1916.

The usual addresses and discussions on questions of practical value to all maritime fruit growers will take up the major part of the programme. All members will kindly prepare themselves to take an active part in the debate at the Wednesday evening session, January 19th.

The agenda at the different meetings, subject to necessary changes, will be as follows:

TUESDAY EVENING

7:30 O'Clock

Opening Prayer—
President's Address— A. E. MacMahon, Aylesford, N.S.
Address— "Sucking Insects of the Apple."
Prof. W. H. Brittain, Truro, N. S.

WEDNESDAY MORNING

9:30 O'Clock

Secretary and Treasurer's Report.
Report of Advertising Committee.
Election of Officers.
Reports of Other Committees.
Resolutions and Other Business.

WEDNESDAY AFTERNOON

2 O'Clock

Address— "The Work of a Dominion Fruit Inspector."
Geo. H. Vroom, Middleton, N. S.
Address—"What is being Accomplished by the Dominion Entomological Laboratory at Annapolis."
Geo. E. Sanders, Annapolis Royal, N. S.

WEDNESDAY EVENING

7:30 O'Clock

Debate—Resolved,that the general adoption of mixed farming by which is meant the keeping of live stock and the raising of feed for the same, in addition to fruit growing, is in the best economic interests of the farmers of the fruit growing counties of Nova Scotia.

For the Affirmative (F. W. Foster, Kingston, N. S.
(R. J. Messenger, Lawrencetown, N. S.
(John Donaldson, Port Williams, N. S.
(W. W. Pineo, Waterville, N.S.

For the Affirmative (W. H. Woodworth, Berwick, N.S.
(A. E. MacMahon, Aylesford, N. S.
(S. B. Chute, Berwick, N. S.
(A. E. Adams, Berwick, N.S.

To make the debate a success it will be necessary for all members having a decided opinion on the resolution to join in the general discussion.

Prominent men in the educational institutions of Wolfville will be asked to act as judges.

THURSDAY MORNING

9:30 O'Clock

Address— "Some Lessons Learned from New England Fruit Growers."
W. H. Woodworth, Berwick, N.S.
Address— "Commercial Strawberry Growing and Marketing."
William B. Fawcett, Sackville, N.S.

THURSDAY AFTERNOON

2 O'Clock

Address—"Why We Should Prune and the Different Treatment for Old and Young Orchards."
M. B. Davis, Ottawa, Ont.

Address—"Scab Control in the Dominion Experiment Orchards in Nova Scotia."
Prof. W. Saxby Blair, Kentville, N. S.

MANNING K. ELLS, Secretary,
Port William, N. S.

To Keep Rabbits From Injuring Trees.

(A Letter from C. S. Harrison, York, Nebraska.)

The rabbit is nature's hypocrite. He seems innocent and harmless, but he destroys millions of dollars worth of trees in young orchards and nurseries.

I once left a small nursery in the fall, and on my return it was gone. Every rabbit for miles heard of the tender young trees, and they were completely devoured.

A great many plans have been devised to save young trees. Some tie corn stalks around them—a slow process. Others use tar paper, and some use the wood shields. Then often a rabbit is killed, and the raw flesh is rubbed up and down. And there is the lime and sulphur wash—a sloppy mess in winter.

Then I devised a process of my own. I got some of the cheapest soap I could find, put on a pair of old gloves, and went at it, rubbing the cake of soap up and down the tree.

It was a quick process; it doesn't cost much, and is efficient. The rabbit is a neat animal, but he doesn't like soap; he cannot endure it. He would rather go without eating.

Soap is a good thing for the tree. Dr. Chas. Bessey, our most noted botanist, commended the plan highly when I showed it to him. He said soap would benefit the tree anyway, destroying the insects which might be hiding in the bark, and so keep the tree bodies clean. There is no such muss in using it as in using washes.

The only trouble is that if it is a stormy and sloppy winter the first application might wash off, but ordinarily one treatment will last all winter. If it does not last, then go over the trees again.

Here is a Good Sign.

On one page of a recent issue of a farm paper, there apepared eleven live stock advertisements in which the signature "& Son." When the farm takes the young man into partnership there is no danger of the futuer for that farm and farmer. More farmers should substantially interest their grown up and growing up sons in the business. Give them a winter course at the N. S. A. C., interest them in pure bred stock, let them have a share in the proceeds and management of the farm; and few of them will heed the call of the city.

Genuine Diamonds and Watches on Credit

Terms 20% down

Advertise in The Maritime Farmer and get Results.

The vitality of the Phoma fungus is considerable, stem cultures living for nearly a year. The perithecial stage of the fungus has not yet been observed in culture or on host tissue, but only the pycnidia. The minimum temperature for the development of this Phoma is about 6° C., the optimum about 28° C., and the maximum betewen 32° and 33° C.

Besides the above localities, the parasite has been recorded from Florence (South Carolina), at Miamisville (New York) and at Herrington (Kansas) and it is probably still more widely distributed.

Formalin as a Spray Against American Gooseberry Mildew.

B. Panten, of Kazmierz, Posen, reports the results of spraying with a 1 per cent. solution of 40 per cent. formalin against American gooseberry mildew (Sphoerotheca mors-uvae). The bushes were sprayed in the early spring before the apearance of the leaves and again before flowering, taking care to wet all the wood and both lef-surfaces.

By this method the lichens and mosses growing on the older bushes were effectively destroyed. During 1913 and 1914 the bushes sprayed were quite free from attack, whilst those in the neighboring plantations were very severely attacked. Bordeaux mixture had been tried for three years without success, as all the bushes had become attacked by the disease.

Sources of the Early Infections of Apple Bitter-Rot ("Glomerella cingulata").

The researches of different investigators on apple bitter-rot in America have shown that Glomerella cingulata, the fungus causing it, can pass the winter in mummied apples of the preceding year and also in the cankers produced by the fungus, from which infection begins in the succeeding year. Other plants than the aple may serve as sources of infection.

According to observations made by the writer in the Ozarks (Arkansas), the fungus can winter on almost any cankered or dead parts of the diseased trees, including the cankers due to the Illinois apple-tree canker fungus (Nummularia discreta), in the dead tips of fruit spurs, the dead parts of limbs due to injury by freezing or death of the roots on one side of the tree, branches injured by mecahnical means, cankers caused by the peal-blight organisms (Bacillus amylovurus) and by the apple-blotch fungus (Phyllosticta solaria.)

The cutting-out of cankers greatly reduced the number of early infections of the disease, though removal of all dead parts is obviously practically impossible.

The Treatment of Peach Leaf-Curl ("Exoascus deformans")

The writer reports experiments carried on for several years in Northern Italy on protecting peaches from the attacks of leaf-curl. Fifteen ungrafted trees in the open were used, as well as 7 ungrafted cordons on trellis and 8 more against a southwest wall protected above by an 18-inch glass roof.

Of the 15 trees in the open, 6 were covered in February wtih a muslin net stretched to the tops of four poles and supported by two cross canes; the remaining 9 were left uncovered and sprayed twice with Bordeaux mixture, at the end of November and again in the middle of February.

None of the cordons were sprayed with Bordeaux mixture, but those on the trellis were covered wtih a similar net, except for two in the middle of the row.

The result was that none of the covered-in trees, whether sprayed or not, showed any trace of leaf-curl; the others were all badly attacked even when treated with the fungicide. The difference was particularly striking in the case of the trellis trees, where the two uncovered trees alone were diseased, those almost touching them on either side being perfectly free. The wall-cordons protected by the glass roof were also free from infection.

The writer recomemnds his method to small growers as inexpensive and an important factor in ensuring a healthy growth and continued fruitfulness. Effective covering with a muslin net so as not ot intercept air and light assures an almost constant setting of the flowers.

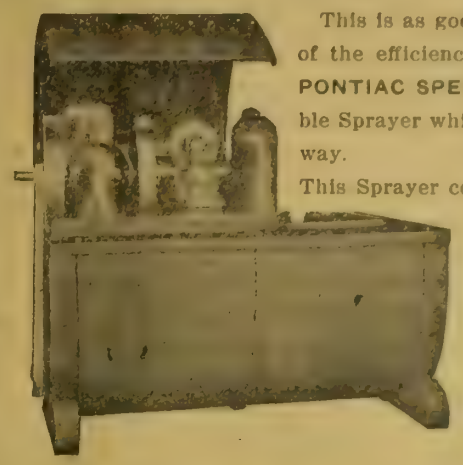
SPRYAING ADVICE

Demonstrations at Sussex and Woodstock to Students taking the 10 Days' Course in Farming, beginning Jan. 3rd, 1916.

Mr. A. G. Turney, Provincial Horticulturist, has arranged to give instruction and demonstrations on Spraying fruit trees and vegetables, at the 10 days' Short Term for Farmers at Sussex and Woodstock.

The Expert in charge of this department of the instruction is Mr. S. B. Hatheway, Manager of the Fruit & Land Company, Fredericton, and the make of Sprayer selected for the demonstration, naturally is the

I. X. L. JUNIOR
AUTOMATIC POWER SPRAYER



This is as good as an official endorsement of the efficiency of the I.X.L. JUNIOR and PONTIAC SPECIAL, as well as our Vegetable Sprayer which is also used by Mr. Hatheway.

This Sprayer consists of a 3½ H. P. Engine, Cypress Tanks; Gear driven, vertical Cylinder Pump; two 25 ft. Leads of Hose; Two Variable Spray Nozzles, complete in all details. The I. X. L. Junior is made in three sizes. For very large Orchards we sell and recommend the PONTIAC SPECIAL.

REDUCING WASTE IN THE ORCHARD.

Instead of letting apples rot and waste or disposing of them as culls and "seconds," why not give your trees and bushes a little systematic spraying and so get "first grade" prices for your fruit. All the foremost fruit authorities agree that the

Spramotor
It isn't a SPRAMOTOR unless we made it.

by reason of its improved construction, does the work of spraying as no other machine can.

The Spramotor won first prize in the Canadian Government Spraying contest at Grimsby, Ont., against eleven other makes. By actual Government tests in 19 orchards it reduced the percentage of loss in fruit over 80 per cent. Used on potatoes a Spramotor has increased a yield of almost nothing to 400 bushels an acre. Think how quickly such a saving or even a small fraction of such a saving would pay for your Spramotor. The Spramotor is operated by hand, horse or gasoline engine; it can be had for as low as $6 up to $400.

THE LONDON SPRAMOTOR, 2810 King St. East, London, Can.

DAIRYING.

A Noteable Canadian Holstein.

Rauwerd Count de Kol Lady Pauline (Holstein), owned and developed at Hillcrest farm, Norwood, Ontario, by G. A. Brethen, beginning her record three days after freshening in the semi-official A.R.O., has produced 29,007 lbs. of milk, 890.6 lbs. of fat (111.25 lbs. of butter, 80 per cent fat), in 365 consecutive days. This record makes her the Canadian champion milch cow by a wide margin. Only three cows in the world have exceeded her year's milk production, one being in California, another in the State of Washington, and the third is owned in Massachusetts. Her nearest Canadian competitor is the well-known "Madam Posch Pauline," owned in British Columbia, who has a record of something over 27,000. Rauwerd averaged nearly 90 lbs. of milk a day for eight months and for that period exceeded the world's champion cow, "Tilly Alcarta" by a substantial margin.

Writing to the Ottawa Valley Journal, the owner, G. A. Brethen, says in part:

"Rauwerd's production throughout was entirely normal and at no time did she appear at all worried or give any indication that to her there was anything out of the ordinary in the making of twenty-nine or thirty thousand lbs. of milk. That this fact was appreciated by others was invariably evidenced by the remarks of every visitor to the farm who commented as to her splendid physical condition. To every one of those, as to ourselves, it was not so much what she had done as ho wshe did it. After having produced over 26,000 lbs. of milk in ten months and travelling 500 miles in a show circuit to retain enough bloom to win second money in a strong class of eighteen at the Canadian National Exhibitioin, Toronto, and first prize at the Central Canada Exhibition, Ottawa, in the strongest Holstein classes ever brought out at these shows, is additional proof that to Rauwerd the making of a 29,000 lb. record was a pleasing an undertaking as is the 6,000 lb. production of the ordinary cow. In this connection we might say that had we not exhibited her at the above mentione dshows her reocrd would have been increased by 400 or 500 lbs. of milk, yet we believe that the opoprtunity given her at these important exhibitions to establish the fact that she possesses type as well as extraordinary production ability and that testing, judiciously conducted, is not necessarily injurious but positively beneficial in developing the cow, is sure to prove of more lasting benefit both to the cow and the breed than a few additional pounds to her record.

"'Like begets like,' probably recog nized as the most potent principle in breeding, is in the case of Rauwerd strikingly established as she is granddaughter of the great Pietertje Count de Kol (who had thirteen daughters with an average daily milk production of 100 lbs.) through a son who has a full sister with a record of 109 lbs. of milk in one day and over 30 lbs. butter in seven days. Rauwerd has proven true to her ancestry and has not only shown extraordinary production ability herself but through her first daughter ni milk, De Kol Mutual Countess, former Canadian champion, junior three year old (present champion in eight months division), she has proven her power of reproduction in the highest degree. The combined semi-official record of this cow and her junior three-year-old daughter of 49,679 lbs. of milk and 1980.75 lbs. of butter in one year is equalled we believe by but one other mother and daughter that ever lived, and establishes in no uncertain way that this family are not only producers but reproducers, "the kind that breed on." The knowledge of these facts is considered sufficeintly important to cause her owner to use exclusively in the breeding operations at Hillcrest Farm the two sons of Rauwerd and her grandson, the only son of her daughter, De Kol Mutual Countess.

"In regard to feed and attention given her during the test, I might say that home grown feed formed a very large proportion of her ration. I am inclined to think that possibly mangels or turnips were of really more value to her in the production of a large flow of milk than any other food. She consumed regularly around 100 lbs of roots a day while in the stable, and we have no doubt but that these were of great aid in maintaining her in a strong, physical condition. Oil meal, cottonseed, gluten, with some distillers' grain combined with bran and chop, varied from time to time to increase it palatability, formed her grain ration, while ensilage, clover hay and pasture supplied the roughage.

"Care was always taken that she had an abundance of water and salt. If she showed any inclination to fall off in production, we as promptly as possible got busy to ascertain an dcorrect the cause before any serious loss resulted.

"Rauwerd has finished her year in the best possible condition and as she is now well on in calf, beliveing the past year's work has been merely a developer, we look forward to her accomplishing even greater things in the future.

"We wish to express our appreciation of the kind interest exhibited by fellow breeders from all parts of Can ada in Rauwerd and her record, and while we regret that we were unable to bring the highest honors in milk production to Canada, still we have the satisfaction of knowing that her 29,000 lbs. record was attained in a large measure by over 30,000 lbs. ideal, and this fact should prove an inspiration to ourselves and others to go forward to even greater things in our work with the Holstein cow."

A Word to the Wise should be Sufficient.

Scotsburn, N. S., Dec. 20th, 1915.
The Maritime Farmer:

May I be permitted to call the attention of your readers to a movement taken up by a number of Agricultural Societies last fall.

The work of cow testing, on the keeping of records of milk and butter fat produced by each cow in the herd, has now been going on for some years among the patrons of Scotsburn creamery, and members of Cow Testing Associations along the Shortline. While splendid results have been obtained and phenomenal increases achieved, yet many of the best dairymen believe that still greater things would be done with an improved class of bulls with which to grade up the herd. While many excellent specimens of the different dairy breeds have been owned by the Agricultural Societies and private individuals, few of them can produce an official record of performance for their dams.

Believing that the breeders of pure bred dairy cattle owe it to their customers and to the public in geenral, for the generous assistance rendered them in various ways, to furnish records of performance at the pail, that can be relied upon, a number of agricultural societies in Pictou county adopted the following resolution at their last annual meeting:

Considering the importance of the bull in building up a dairy herd, and

Considering the great number of animals carrying registration, names and numbers, which so far as production goes are little better than the common scrub, and

Considering that the live stock branch of the Dominion Department of Agriculture tests the cows of pure bred breeders free of charge and at a minimum of cost to the breeders,

Therefore be it resolved that the members of this society strongly urge upon their directors the importance of purchasing bulls from record of performance dams, and that if it be impossible to secure such bulls that they will purchase no bull whose dam does not possess an official record without making strenuous objection to the breeder of the bull.

Now then, breeders, it is up to you. When such men as the members of the agricultural societies at Rogers Hill, Lyons Brook, Scotsburn and Elmfield say that a big preference will be given for records, they mean it and will live up to it. Also it means that many more will rapidly follow their example.

This demand does not confine itself to farmers using bulls of the four principal dairy breeds, but breeders of grade Shorthorns are just as insistent on knowing accurately of doings at the pail.

Records that can be relied upon are what they will insist on having in the future.

Sincerely yours,
ROBT. T. STEWART,
Secretary Scotsburn Creamery Co. Ltd.

Ability of Bacillus Coli to Survive Pasteurization.

The presence of bacillus coli in pasteurized milk is generally interpreted as an indication of insufficient heating or of fresh contamination owing to carelessness after pasteurization. The interpertation is based on the low thermal death point of the bacillus. Several workers have studied cultures during recent years and have stated that this organism was easily destroyed at temperatures below 60° C. Sometimes, however, it has happened that much higher temperatures (e.g. 70-72°) were necessary to destroy the organism. With a view to determining with more exactness the fatal temperature for B. coli and its relation to the temperatures of pasteurization, the writers carried out the following researches.

The fatal temperature for 174 cultures of B. coli isolated from the faeces, milk and cream of cows, from human faeces, flies and cheese, showed considerable variations when the cultures were heated in milk for 30 minutes under conditions identical with those of pasteurization. At 60° C., the lowest temperature, of pasteurization, 95 cultures or 54-6 per cent survived; at 62.8° C., the ordinary temperature of pasteurization, only 12 or 6.9 per cent survived. One culture was not destroyed at 65.6° C. on first heating, but succumbed when reheated several times. There is a marked difference in effect of heating to 60° C., and to 62.8° C., 87.3 per cent of the cultures which survived at 60° C. being destroyed at 62.8° C. There were considerable variations in the fatal temperature of the bacilli which survived at 62.8°; on reheating to the same temperature the twelve cultures which survived, several succumbed, and with each reheating different results were obtained. It appears that a temperature of 62.8° C. maintained during 30 minutes is the critical temperature for C Coli. It was found that in all the 174 cultures studied, the thermal death point for the majority of the individual bacilli was low, but the cultures were able to survive pasteurization owing to the resistence of a small number of individuals.

The use of B Coli as a test of the efficacy of pasteurization is complicated by the ability of ceratin strains to survive heating to 62.8° for 30 minutes and to develop rapidly when the pasteurized milk is maintained under or-

MAXWELL'S, LIMITED, - - - St. Mary's, Ont.

3

dinary conditions of temperature. The presence of a large number of B. Coli immediately after heating may indicate defective treatment of the milk. If the milk is pasteurized for 30 minutes at 65.6° or more, it may be assumed on the strength of these experiments that none of the bacilli will survive. Under these conditions the B. Coli test may be used to control the efficiency of pasteurization. It is possible, however, that the study of a greater number of cultures would reveal the presence of strains of B. Coli capable of a greater number of cultures capable of surviving this or even higher temperatures.—S. H. Ayers, and W. T. Johnson, Jr., in Journal of Agricultural Research, Vol. III., No. 5, pp. 401-410. Washington, February, 1915.

Common Cows Often Capable Milk Producers.

As a whole, the "natives," or common cows are inferior in the milk giving property to any of the adiry breeds; but there are remarkable exceptions. My father had a native cow that, when fresh, and well fed, would give about 24 quarts of milk in 24 hours. She was a large cow, but had no distinguishing marks by which experts think they can determine a great milker. She was not wedge shaped. She did not have a small neck, nor the nervous temperament. Her head and horns were large, an dresembled those of an ox. The only dairy marks she had were large milk veins and a capacious udder.

I have owned several remarkably good common cows. The best one resembled my father's prodigy in everything but color, and was almost her equal in milk production. She was a voracious eater, and not at all particular about what she ate. She devoured whatever decent feed was placed before her. When turned into the pasture she did not follow the example of the other cows and run all over the field before commencing to eat, but began feeding as soon as through the gate. She was not a bright cow. On the contrary, she was stupid and stolid. When turned into the stable through the door, which the herd usually entered, she would find her place every time; but when let in at the opposite door she was sure to make a mistake, and take possession of another cow's stall on the opposite side of the stable from her own.

I had a pure-bred cow about the equal of my native as a milk producer, but not quite her peer as a butter maker. Naturally she was of a suspicious disposition, apparently always expecting some treachery, or breach of faith on the part of her owner, and no amount of kindness would make her a confiding animal to her feder or milker. I bought her when full grown. I think she must have inehrited her suspicious disposition from some near ancestor that had been abused. She must have known that the removal of the milk from a full udder made her feel more comfortable, and yet at night when her udder was very full it was a hard matter to milk her without kicking. Like all uncommonly good cows at the pail, she was a hearty eater, and had room to store a large amount of food while undergoing the process of milk manufacture. No cow in the world is capable of extracting a large quantity of milk from a small amount of material. They must have milk producing feed and a plentiful supply of it.

Cow Peculiarities

I have had cows that were naturally very friendly—would follow me when I crossed the pasture field, although they could see I had no feed or salt for them, and happened there on other business. One of our cows would bawl to be milked if neglected when her turn came. Several of us had been milking one night, and she was skipped by mistake, and we were leaving the barn when she commenced bawling and I went back and milked her.

Cows have their likes and dislikes. The hired man had been milking one of the cows for a long time. One night he being busy with the horses, I sat down to milk the cow. She offered no resistance, would not "give down" her milk to me. As soon as the hired man came and took the pail, she gave down the milk.—J. W. I.

Be Kind to Cow That Holds Up Milk.

Cows will sometimes refuse to "give down" their milk, especially to a strange milker, while a rough milker will often upset a herd. The remedy in these cases is to get rid of the offending milker, for among dairy cows gentleness and kindness should always rule. If a cow evinces a dislike for one milker or a preference for another, it is best to humor her and hand her over to the care of the favored individual entirely. The superiority of women as milkers is generally admitted by all experienced cow keepers, and the obstinate retainer of her milk will often prove tractable with a woman, while obstinately refusing it to a man. Unfortunately, however, women milkers are scarce.

When a cow persists in holding her milk a common remedy is to attempt to divert her attention from the operation of milking by providing some tempting food. The question of feeding at milking time is a debatable one, and there are arguments against it, but nothing makes cows so much at home in the dairy barn or brings them to it so cheerfully as some wholesome food. As a general rule, the relationship between the cow and the milker is good in dairies where feeding at milking time is well established.

In some cases, with a strange cow patience wins, and if the milker sticks to his stool and keeps rubbing the udder and stroking the teats, he will tire out the most fitful of cows. In other cases it seems a better plan to leave the cow for a time and return to her a half an hour alter. In extreme cases it may be found more effective to refrain from milking until the distension of the udder begins to cause incvonvenience, but there are drawbacks to this, and if carried too far there may be a case of garget or a bad quarter.

Putting a weight over the loins is a favorite remedy with some, and I have seen heavy chains and bags of sand, earth, or wet browers' grains employed in this way. The idea is that the weight on the loins has an effect on the ability of the cow to control the voluntary muscles of the udder, which, under normal conditions, no doubt she can, but such measures are calculated to upset a nervous cow and can never conduce to a big yield of milk.

It is well to bear in mind that the udder is not simply a reservoir for storing milk, which can be emptied by overcoming the resistance of the cow. Secretion goes on while milking is in progress, and is favored by the gentle stimulus of the hand of the good milker, or the calf's tongue and palate. There is no doubt but that kindness, patience and perseverance are the mosst successful means to overcome a disposition "to hold the milk."—W. H. U.

Cow Ailing after Calving.—I have a cow, six years old, calved two weeks ago, who goes off her feed. Each year after calving she gets listless and loses appetite, and goes off in milk as well. She calved and cleansed well, but in a few days got constipated. We gave her a dose of oil, and she seems to be picking up a bit, but is not giving enough milk. She picks at her grass, never eating a hearty meal. Locally her condition is called "slow fever," "low fever." Could you advise what to do? She was such a promising cow, with a beautiful udder, had been dry three months, and had a very well-nourished heifer calf. You can understand that three months dry and three months ill (as she was two years ago and six weeks last year) takes the cream off the milk and "gives one furiously to think," whether she is worth keeping to breed from.—Marlow.

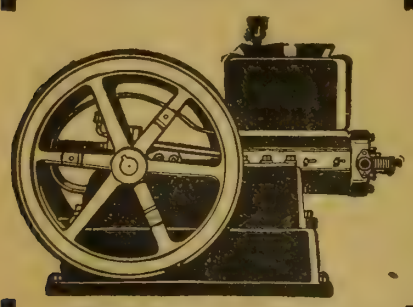
Ans.—Evidently the cow gets a milk attack of parturient fever, which may be caused by wet and cold, unsuitable food or the absorption of septic matter, and you should inject and wash out the genital canal with a 1 oz. to 50 oz. solution of permanganate of potash daily. Give her a dose of Epsom salts, and afterwards twice daily one of the following powders either in her food or as a drench shaken up in gruel: Sulphate of quinine, 20 grains; nitrate of potash, 1 drachm; powdered gentian, 2 drachms; powdered aniseed, 2 drachms. Feed her with some crushed corn, malt culms and mashes. As you have had trouble with her each time after calving it would be better to dry her off and fatten her for the butcher.

Stomach Worms in Sheep—In a recent issue you give a very interesting and instructive article on stomach worms in sheep. We should be glad if you could continue the subject by giving us some practical information as to how to deal with the trouble and what medicine is advisable. Also does this treatment apply to all worms in sheep?—T. J.

Ans.—There are no less than eighteen kinds of round worms which may infest one or another portion of the abdominal tract of the sheep, and are found in either the fourth stomach, small or large intestine, and owing to the bulky nature of their food are often rather difficult to expel. Then, again there are the flat or tape worms, of which thehre are no less than thirteen different kinds. When sheep or lambs are affetced with any of these thirty-one known different varieties of abdomenal worms, they lose condition, and in some cases are affected with parasitic diarrhoea, caused by the irritation to the stomach and intestines bringing on gastro-enteritis. In the case of round worms in lambs, it will be noticed that the lambs are doing badly and losing flesh, and are also affected with watery, profuse diarrhoea, and increasing weakness, death often taking place in from three days to three weeks. Should one happen to die, it is a good plan to open it, taking care that the contents of the fourth stomach do not escape, and make a search to determine whether death is caused by round or flat worms, as the treatment differs slightly for each kind. A useful cheap drench can be made as follows: Take 4 oz. of powdered sulphate of copper, 4 oz. of mustard, and well mix with 3 gallons of rainwater in an enamelled bucket. When the sulphate of copper is dissolved it should be given in the following doses: Lambs from three to six months old, 2 oz.; six to nine months old, 3 oz.; nine to twelve mbnths old, 3½ to 4 oz. Give after a twenty-four hours' fast and allow no water on the days of drenching. Another powder which answers very well with sheep is powdered arsenic, 1 drachm; table salt, 4 oz.; powdered sulphate of iron, ½ oz.; powdered areca nut, 2 oz.; powdered nux vomica, 2 drachms. Well mix and divide into thirty powders. Give one daily to each adult sheep. Thymol and santonine are among the best drugs we have for the expulsion of round worms, but, since the war, have become so very dear and so nearly unattainable that they cannot be used for animals. Tape-worms can be easily recognized, and are often seen in the droppings, looking like small pieces of white, flat tape, and the animals infested should be first given a dose of castor oil, 2 oz. to 4 oz., according to size. After this has operated, give from 1 drachm to 2 drachms, according to age, of freshly powdered areca nut, and the dose repeated in three or four days' time. General treatment may be adopted as follows: After having expelled most of the worms, it is best to give the sheep a tonic which will also help to prevent reinfection and expel any stray worms that may have remained. A powder composed of powdered sulphate of iron 3 drachms, table salt, 5 oz., powdered fenugreek 10 oz., is suitable. Dose for a lamb one tablespoonful; from six to nine months old, one tablespoonful and a half; older, two to three tablespoonfuls daily. This should be mixed with some dry trough food, which should include some cake, crushed oats or meal. As a prevention, separate all the healthy animals and if possible place on clean pasture, turning other animals, such as horses, on the ground to graze. If the pasture is poor and worn out it is worth while considering the desirability of plowing it up. Then, again, dressings of salt, lime or sulphate of iron are worth trying. Where possible after giving the worm doses it is best either to burn or well coat the droppings with plenty of unslaked lime to destroy the eggs.—Southern Vet in English Exchange.

Gilson Engine

"Goes Like Sixty"



ANYBODY can operate the simple "GOES LIKE SIXTY" Engine. Ready for work the moment you get it. Built strong and solid to last a lifetime. Will give long, unfailing satisfaction. Gas, gasoline or kerosene can be used for fuel.

GILSON QUALITY gives full value for your money—dependable service, great durability, highest economy and perfect satisfaction; freedom from trouble, delays and expense.

EVERY ENGINE ABSOLUTELY GUARANTEED. You can try this engine on your own farm before settling for it. You take no chances.

THE "GOES LIKE SIXTY" Line has an engine for every purpose. All styles and sizes from 1 to 40 h. p.

Keeping Lambs Healthy in Summer.

It is during the wet summers that parasitism prevails among flocks in the eastern states. Chiefly the parasitism is from the stomach worm, which gives the disease variously termed black scours, lamb cholera, or paper skin. The cause of the disease is a minute worm living in the fourth stomach of the animal and causing there terrible derangement of the digestion, besides absorbing a great deal of the animal's blood.

Treatment is not always satisfactory, although much good can be done by the use of gasoline or coaltar creo-

MOTHER
SEIGEL'S
SYRUP

The proof of Mother Seigel's Syrup is in the taking. That is why former sufferers, whose vitality was being sapped by Indigestion, say it is *just excellent* for stomach, liver and bowel troubles. Thanks to Mother Seigel's Syrup, they are now strong and well.

IS EXCELLENT FOR

If you are afflicted by Indigestion or other disorders of the stomach, liver and bowels take Mother Seigel's Syrup regularly for a few days; long enough to give it a fair chance to make its beneficial influence felt. Then note the improvement in your appetite, your strength, your general condition. 3015

The 100 bottle of Syrup contains three times as much as the 50c size.

sote. Not to talk of treatment now, let us see what can be done by way of prevention. Frequent changes of pasture is the most essential thing, and the avoidance of small and richly grassed lots where the droppings of sheep have been much deposited for a long time. The infection comes from the mothers that in their excrement deposit the eggs upon the grass. These crawl a little way up on the fresh green blades and are taken in by the lambs. It is clear that if the lambs are born early and are separated from their mothers as soon as weaned and put on good clean grass the danger of infection would be greatly lessened.

Infection will not come much from clover or alfalfa pastures, nor from grazing on new land recently seeded. Sweet clover pasture will not often affect the lambs. If the lambs are very valuable, and it is difficult to put them on clean, sound grass, they would be better put in an airy shed and fed on the soiling plan, and be given also some grain. Thus fed they will keep healthy, if they have no grassy lot in which to run. It usually is the small lot richly-grassed that carries the most germs, because there the sheep have more often fed. Above all things change as frequently as convenience will permit. When placed on a safe pasture they will be free from danger of infection during June and July for a period of ten days. If then they can be moved onto clean grass they can after a while come back again to the pasture first used. There is no doubt that in the change of pasture lies the greatest advantage in combating the stomach worm.

We have tried tobacco feeding also with good results as a preventive. The tobacco is cheap, and I think harmless. One can get stems or cheap leaves from cigar factories. Moistening with salt water, not too briny, he can place it at the command of the sheep, and they will eat a great deal of this during the summer. In our experience turpentine has proved useless, or nearly so. Gasoline and coaltar creosote has been highly efficacious, but it has been several years since we have given a dose of medicine to a sheep.—Joseph E. Wing, in Breeders' Gazette.

Wool.

Care During Fall and Winter

During fall and winter care should be taken to keep the fleeces of the flock as free as possible from chaff, chaffy straw, dirt, etc., from the feed. The racks of the sheep shed should be built upright, not overhanging the sheep's back, which latter form is most objectionable. If the flock has access to a straw pile, the open side or sides should be kept straight up and down so that the sheep cannot walk under overhanging straw, and the fleeces thus get filled up with chaf, etc. The shepherd should be as careful as possible in filling the racks or throwing down feed to see that it does not light on the backs of the animals. For this reason it is usually advisable o shut the flock out of the sheep shed when filling troughs or racks. The sheep shed should be so ararnged as to render it unnecessary to carry fodder through the flock, or to throw it down where dust or chaff may fall on the fleeces. Cockle burr, or burss of any description should be avoided. If in pasture mow down. If in seed do not use for sheep.

Cleanliness

Sheep should be kept in as clean and dry quarters as possible and all sheep should be docked. Prior to winter they should be tagged or clipped out, the dirty clotted portions of the fleece around the exterior being cut away in this operation. Sheep will not do so well if kept on damp footing or with damp fleeces. The careful sheepman will see that there is abundance of bedding, clean floors, absence of draughts, but ample ventilation and a good roof over his charges, and will be amply repaid for his troubles. Laxative feeds, or feeds which produce scouring, such as frozen oat sheaves, millet, etc., are also undesirable from the point of view of clean fleeces. Ewes at lambing time should be taken especial care of, and a dry, well bedded place or, if outside, a high, dry knoll should be selected for a lambing pen. Sheep must be kept in good, healthy condition with plenty of wholesome food and pure water throughout the year if they are to produce a maximum quantity of sound wool.

The Primrose

A "One-Adjustment" Cream Separator

BEFORE the **Primrose** came, cream separators were machines of many gears and bearings, requiring all sorts of adjustments all the time. If you ever owned one, you know what that means. It was tighten this, and move that—adjustments that you never felt quite safe in making yourself. You knew you were losing cream, but couldn't help it, and you found even a wasteful separator much better than hand skimming.

All those adjustments are now done away with. The **Primrose** is, in truth, a "one-adjustment" machine. There is only one place where wear affects the work of the **Primrose**, and that is on the hardened steel point that carries the weight of the whirling bowl. And since this point is made of finest tool steel, tempered like a fine razor, you can see that the adjusting will not take much of your time.

Ask the **Deering** local agent, who sells **Primrose** cream separators, to show you this machine that anyone can keep in perfect working condition all the time, or, write us at the nearest branch house for complete information. If you're going to buy a separator, you'll never regret the time you spend studying the **Primrose**.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience,** we know better than any doctor; and thousands have proved there is hope even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid,** to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home **treatment, and when you are cured,** my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures greensickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten days' trial, and if you wish to **continue,** it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer. **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day,** as you may not see this offer again. Address:

MRS. M. SUMMERS BOX 309, WINDSOR, ONTARIO

THE HORSE

Confidence Must Exist Between Driver and Horse.

The Well-Broken Animal Must Respond to the Will of His Master

A well broken horse is one that always responds to the will of the master, be he rider or driver. For a horse to be well broken means that much training and experience have been the lot of that animal. The term well broken is oftentimes misleading. A horse may be perfectly well broken on the farm and if taken to the city will be almost unmanageable. Only a few years ago many horses were well broken to farm work and to all that might be encountered on the road to town. Then almost suddenly the auto appeared. Men and drivers were afraid. Many were the wrecks that occurred behind teams that previously had appeared perfectly well broken.

A well broken horse should be required to prove his good qualities. True the gypsy and the professional trader have decreased in a large percentage, yet there are t hose who would say anything in a horse trade. David Harum of fiction sold a horse guaranteed to stand without hitching. The beast certainly did stand without hitching, no matter if his master desired to plow corn or drive to the village. In spite of all persausive efforts the old nag stood. The David Harum of actual life promises that any outlaw is well broken and will consider that he has performed a wonderful feat of business by defrauding some man whose conscience is less seared than his own.

To give a young horse the right start when first encountering new experiences is a big factor in pulling him into the class that is permanently well broken and which under trying conditions will have confidence in the driver. Sometimes the unexpected occurs without anyone's being to blame.

The horse must have confidence in the driver else he cannot appear to be and cannot be well broken. Panic-stricken drivers have doubtless caused more than 50 per cent of road accidents. It is doubtful if any horse can be trained to every experience that it may encounter. It is doubtful if that is necessary. If the horse has ordinary intelligence he can be trained to a variety of experiences and at the some time trained to have confidence in his driver. Having been trained to have confidence in his driver he is safe under all that may ordinarily occur, provided of course that the driver has had experience and possesses self-confidence and some skill.—H. E. McCartney.

Chronic Laminitis.

J. M. H.—"We have a mare five years old that has colt born in June. The mare is stiff in front and seems to be weak in both hind legs and she walks as if she was too heavy behind for her hind legs. Legs spring down nd when walking props herself up with her front legs and walks slowly. She worked for about a week on a gang plow before she had colt and has not done any work since. We have had her turned out with the colt and put her in at night. This is her first colt and both are in fine shape. She has not been over fed in any way. There is nothing else wrong with her that we can see."

Answer—Your mare is suffering from chronic laminitis—founder. If you examine her fet, especially the front ones, you will find the soles dropped and quite likely the pedal bones may be exposed. The best treatment to adopt is shoeing with shoes well hollowed out so that they do not touch the sole anywhere. Put leather pads with tar and oakum under the shoes, change the shoes every three weeks. The case may also be further improved by the application of a blister around the coronets of each affected foot. Clip off the hair around the coronet, then well rub in for twenty minutes, each foot, the following blistering ointment: Powdered cantharides, 3 drams; biniodide of mercury, 3 drams; fresh lard, 4 ounces. Mix well. This is sufficient for both feet. Tie her head up for forty-eight hours so that she cannot reach the blistered part with her mouth. Then wash off the blister with warm water and soap and smear on vaseline every three days. If necessary repeat the blister in three weeks.

Ringbone—Sidebone.

New Subscriber.—"I bought a mule some three months ago. When I bought her she had one shoe on one front foot and a touch of side bone on the other which never bothered her. I pointed out the shoe to the owner and he said she pulled the other one off in the mud as the blacksmith put it back on the heel because of the sidebone. I drove home (about 250 miles in eight days) and noticed no lameness, but when I pulled the shoes off she started to limp on that foot, and when she get on the road she is real lame. She seems a little better after she has been out of the barn a while excepting when on the road, where she gets worse. She walks slightly on the toe. I can find no part of the foot painful to pressure but fancy I can note a slight thickness round the pastern as of a ringbone forming, but I may be wrong. It looks as though the shoe I have referred to was put on to ease her before I got her and to help cure her trouble, whatever it is. Also give me treatment for long standing case of sidebone."

Answer—The thickness around the coronet indicates that a ringbone is forming. The inflammatory action may possibly be overcome by firing and blistering. The counter irritation thus set up would probably check the deposit of bone and so stop the lameness. The same treatment is in order for sidebones. It will be necessary to S. Exchange.
employ a veterinarian to operate.—U.

Chronic Founder

Subscriber.—"1. Last spring I bought a heavy horse. Was very poor and tender in front feet. I turned him on the grass and in a month I could not tell he had been lame, but all at once he got so lame that he could hardly awlk and has been lame ever since. He does not put his feet down straight, but keeps his weight on the back part of the hoof.

"2. Both legs are swollen about twice their natural size around first joint and are very hard.

"3. Have also some young mares running on the grass that I bred, both last summer and this, to different horses, but can not get them in foal. Is it safe to give these mares some drug?"

Ans.—1. Your horse has had repeated attacks of "laminitis" (founder), which has resulted in descent of the pedal bone through the sole. Carefully examine the foot. You will find the sole bulging between the point of the frog and the toe. The only thing to be done to make the horse useful is to apply shoes with thick walls, well hollowed out so that they do not touch the sole, and leather pads with tar and oakum packing.

2. The swellings above the hoof are "ring bones," which may be a complication of the laminitis. A good firing and blistering may afford relief. Of course, the operation must be done by a qualified veterinary surgeon.

3. Drugs are useless in these conditions. The causes of barrenness are many, among them are extreme poverty or the reverse, plethora, diseases of the ovaries or other parts of the generative system. In very many cases of barrenness there is a malformation of the neck of the womb which may readily be rectified by a veterinary surgeon at the time of the service. The cause must be sought for an removed. If too thin, feed up. If too fat, reduce rations.

Horse has Descent of Coffinbone.

J. M.—Have driving horse on which I noticed a ring-bone appearing about a year ago. Used ring-bone paste last winter but did him no good. Got him fired last spring and now that the firing spots have healed his foot has gone bad in the bottom, the hoof rotting away and a gray greasy substance exuding from the bottom and in back of the heel. Horse has been out most of the time. What is the trouble, and if curable, how can it be done?"

Answer—Your hourse is suffering from descent of the pedal bone due to long continued inflammatory action around the coronet and in the foot. Unless he is a very valuable animal he may not be worth the trouble and expense of treatment. He will never become sound. However, the best thing to do in a case of this kind is to apply a shoe which is well hollowed out so that there is no bearing on the sole, then after well disinfecting the diseased sole with pure creolin, cover it with pine tar and oakum, which is kept in place with a leather pad. Change the shoe and dressing every two weks.

The Horse in Warfare.

From the days of earliest history the horse has been closely connected with warfare, and in more modern times has greatly contributed to the making of British military annals. Such charges of cavalry as those of the Light Brigade at Balaclava, the Scots Greys at Waterloo, the Guards at Kassassin and the 21st Lancers at Omdurman have furnished military writers and painters with subjects of the highest order. Many a battle has received the casting vote from the cavalry, as the horses prove a means of quick transit and the thunder and shock of a cavalry charge on a weakening force generally proves a demoralizing factor. Also it is to the horseman that the duty falls of cutting up detached parties before they can reform or get into touch with the main body, and other duties or pursuit.

The pathetic side of war is a phase that the horse shares with his human comrades, though it is said that much of his cries on the field after battle are from loneliness as much as of pain.

There is a famous picture that was hung in the Paris Salon representing an after-battle scene in the Franco-Prussian war. It shows a group of cavalry horses, after having lost their riders, dashing across the field after darkness has set in, presenting a picture of unchecked madness.

SYDNEY BASIC SLAG.

We strongly recommend all farmers to arrange for their supplies without delay. The demand is constantly increasing and it looks as if there will again be a shortage next season.

The comradeship between men and horses in the Service is very marked. "Make much of the horses," was a common phrase in South Africa, and in that campaign, it was that the Mounted Infantry demonstrated their great usefulness. That branch of the Service is an example of horseflesh infused into infantry work.

A military training is of especial benefit where horses are employed, as the soldier gets a good physical training in the riding school and at the same time gets a spirit of confidence while around horses. In military competitions one sees combats between, say, a mounted man armed with a sword versus a man with a rifle and bayonet. Occasionally a cavalryman will act as an infantryman, and oppose a mounted comrade. Then one sees a well contested fight, as, where the infantryman may give ground to the onrushes of the horse, the dismounted cavalryman stands his ground, as he knows that the horse will not tread on him. Horse sense is of great assistance in the military training of the modern soldier, and those of the British Army who have been through the riding school are graduates of an institution said to be the finest of its kind in the world, or at least the most thorough.

The present great European war has brought into prominence the usefulness of motor driven vehicles. These are co-operators rather than competitors to the horse, as they take off his shoulders the task of a merciless haul over roads that become a very hard trial on all means of transport. Gasoline has no more driven the horse from the Service than it has driven him off the farm. If it were so, or likely to be so, the present high prices would not rule in the horse market.

The military horse is essentially a good scout. Of these hazardous duties he is of special aid to his rider, by uniting equine intelligence with the human intelligence of his companion scout. He is cognizant of the presence of horses in his vicinity long before some men may be aware of the fact; this is due to his superior sense of smell. He soon acquires a soldier spirit and becomes partial to the environment of barracks and camp. As a soldier, his fame may live after him as it has done in several cases, where a silver mounted hoof on the regimental mess table remains as a memento of one whose duty was faithfully performed.

Absorbine and Absorbine, Jr., are made in Canada.

Intestinal Worms.

Subscriber.—Colt, 18 months old, has run in good pasture all summer, but is still in poor flesh, quite often passes small white worms, about two inches long, with manure.

"2. Also a horse has a sore tail, all the hair came out of his tail near the end, leaving it swollen and very sore."

Answer—1, Intestinal worms are mostly seen in horses that are in poor condition, and an essential part of the treatment is to improve the appetite and powers of digestion. A tonic composed of the following may be found useful: Gentian, 4 ounces; powdered ginger, 2 ounces; salt, 4 ounces; fenugreek, 2 ounces; powdered nux vomica, 2 ounces. Mix well, and give one tablespoonful in the feed night and morning. Injections into the rectum of a solution of quassia chips, one half pound soaked in a gallon of cold water over night, then strained and the clear liquid to be injected once daily for a few days will remove any worms that may have been lodged or be found in the rectum.

2. It is possible that your horse has received some injury to the end of his tail such as being pinched in a door. Sometimes a mischievous person will tie a string on the tail—this must be looked for—with the result that the part may die and slough off. It may be necessary to have the diseased portion amputated, which operation would necessarily have to be done by a veterinary surgeon. The thorough cleansing of the part daily with a two per cent creolin solution and the application of a drying powder such as boracic acid, 8 ounces; iodoform, ½ ounce; starch, 4 ounces, may overcome the trouble.

Gombault's Caustic Balsam

Tonic for Horse in Poor Condition.

Chronic Indigestion or Worms May be Cause of Dry Hair and Loss of Flesh

A horse about eleven years old seems dry in the hair and does not gain in flesh. Is troubled with a cough after drinking.

2—Mare becomes lame in the hind leg after driving about half a mile, and if driven further will fall down. What is the trouble and please advise the remedy.—W. D.

Your horse is probably troubled with chronic indigestion or may have worms, a bad mouth, etc. Have your horse's teeth examined and if necessary floated. Prepare and give one quart raw linseed oil with two ounces of turpentine added.

Take Gentian 4 oz., nux vomica 2 oz., nitrate of potash, 3 oz., sulphate of iron 3 oz., funegreek, 4 oz. Mix. Give one tablespoonful in boiled grain mixed with bran night and morning for a few weeks.

2—Impossible to state positively the cause but may be due to plugging of some of the large arteries. Have your mare examined by your nearest and best veterinarian.

Fistulous Wither Difficult to Cure.

Can a fistulous wither be cured? I have a mare troubled with one since spring and have had her under the treatment of a horse doctor, but without results. There is a hole about four inches long and about the thickness of a finger.—S.N.

The only effective treatment for fistula is to open it up well and provide drainage afterwards washing out with any good disinfectant such as creolin, carbolic acid, bichloride or mercury, etc. Some recommend zinc 1 oz., water 8 ozs., syringed into the opening once daily.

FREE—FARM ACCOUNT BOOK

Know How Much You Make This Year

No one shall pay a cent for Bickmore's Farm Account Book. Mr. Farmer, simply send us your name and address. Business farming puts money in the bank. This book is arranged to keep all accounts in simple form—more simple, and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborer's time record, and section for personal accounts. 64 pages; for ink or pencil. Not a cheap affair. Its quality is in keeping with

POULTRY

Simple Methods Will Fatten Hens.

Although American poultrymen do not lay as much emphasis on the finishing of poultry for market as do European breeders, fattening processes are gradually coming in vogue. Generally speaking, it is only the professional poultryman that makes any effort to place the fowls in top-notch market condition. This should not be so, since prepared fowls not only bring a better price, but consumers agree that they make better eating.

A thin bird is not attractive, as the skin is more or less shriveled, and the flesh tight against the bones which appear prominently. With this in mind, the comparison of cost receipts shows a decided advantage on the side of fattened poultry. For years turkeys and geese have had more attention given them during the high-priced seasons than chickens, but this should not necessarily be so, for chicken is in demand for the entire year.

The fundamental factor of successful fattening is to keep the hen quiet. This by itself may cause an accumulation of fat, but in general practice it is customary to feed a greater excess of fat in the ration than would be given to ordinary layers. The rapidity of the process would depend upon the fat-producing value of the food, and the ability of the bird to utilize the fat and keep up its vitality under close confinement.

In some sections where chickens are grown especially for market, a fattening ration is continually kept before them. The breeds raised are inclined to put on fat, and having an abundance of food at all times will take but little exercise. Thus, when full grown and ready to sell, they are as plump as the market demands. Where layers or breeding fowls are the chief source of income the pen method of isolating and fattening the birds should be practiced.

Utility vs. Fancy Poultry.

A Cape Cod poultryman who has been trying to find a market for breeding stock and eggs of a very practical strain of poultry, has become slightly discouraged over the lack of quick response. He complains that most buyers seem to think more of feathers than vigor, hardiness and eggs, and he inquires with a trace of bitterness whether anybody really cares about utility in poultry. While not many poultrymen would admit that they care more for feathers than for productive qualities in fowls, the facts seem to show that the ornamental features are considered very important. The average poultry keeper usually tries to take the middle course and to get pure-bred, prize-winning fowls that are also good in vitality and productiveness.

It is true that some strains combine both qualities to quite an extent. Still the attempt meets with the usual fate of trying to go two ways at once. It does not appear that any strain is producing both prize layers in the poultry contests and prize exhibition birds at the shows. Those who wish to obtain the very best laying qualities must give up soemthing in the appearance of the stock, and those who wish to breed for exhibition, or even for style and color, must not expect to obtain the greatest possible number of eggs or to produce market poultry at the lowest cost per pound.

In practice, however, it often works out very well to combine both lines. The small poultry keeper buys some breeding stock with a reputation behind it for prize-winning qualities, and if he is wise he also looks out for a good degree of vigor. When his young stock is grown he finds there are quite a number of high scoring birds, and he is able to sell the surplus of these at far above the price of market poultry.

It might seem that the demand would soon be satisfied, but it is not so. New flocks are continually being started, and new blood is wanted for old flocks, while the number of high scoring birds is always a very small per cent of the total hatch. The flocks bred for utility only may also meet with a pretty good demand for breeding stock. In the case of winners at egg laying contests the profits may be very large at first, but the market will be less enduring than for fancy stock. All or nearly all rthe chickens of the hatch will be available for the market, since feathers or style would not count. Hence after a year or two the supply will possibly more than equal the demand.

Pure-bred poultry is considered as a class more profitable than commercial stock, because of the possibility of selling each year a part of the output as breeding stock, and selling the eggs in the spring for hatching. Breeding stock sells all the war from $2 to $5 or $10 a fowl up to several hundred dollars for fancy show spceimens. Eggs for hatching commonly range from $1 to $5 a sitting. There is a demand for incubator eggs at $5 to $10 a 100 from good pure-bred stock. After selling all the choice breeding stock there is still the remainder of the flock to be sold as market poultry, and after the hatching season is over the eggs can be sold at the market price. Competent breeders who handle large numbers of pure-bred stock expect to realize a profit of not much over $1 a fowl.

More Stability in Commrecial Flock

A commercial flock, however, offers a greater chance of expansion of the business as the demand for the product is practically upnlimited, and less special qualities of skill and salesmanship are required as compared with the successful breeder of pure-bred stock. Commercial stock is in good demand, but not usually at high prices, althought it is to be noted that the champion laying hen at the Missouri experiment station was sold for $800. Some of the best paying strains are strictly pure bred, meat and egg production, rather than for points favored in the show. Eggs and breeding stock from some of the winning pens at poultry contests have sold for as high a price as can be obtained for average pure-bred stock.

At present high prices of grain, the annual feeding cost of medium weight breeds is usually reckoned at $1.50 to $1.75, which is the cost of about 100 pounds weight of a mixed diet. When labor is reckoned as a part of the cost it is to be placed at around 25 cents a fowl. Cost of feeding hens at the Cornell station was $1.82 each, to which should have been added a small sum for green food furnished. Various estimates at hand from private plants where all costs are included, range from $1 to $2 per layer. In these accounts it seems unusual to find any large plant averaging better than 12 dozen eggs a year for each hen. On large plants, as ordinarily conducted, an average of 3 cents an egg is all that can be obtained the year round, and even then some of the eggs were bringing high prices. To exceed this average would seem to require quite a percentage of sales fo rhatching purposes. A fair estimate of expense must include interest and depreciation on equipment, worth $3 to $5 a hen.

Small flocks with high laying records sometimes show fancy profits, as for instance, the Leghorn fowls at the Connecticut station which laid over 200 eggs apiece. They showed a profit over cost of food of well over $4 a bird. But when large flocks are considered, figures are quite different, while labor and losses become more important, and the average output is greatly reduced from those exceptional records made from small flocks. The product is placed at about 10 dozen eggs apiece for the medium weight breeds in this section, and the average price of late years has been 25 to 30 cents a dozen, depending

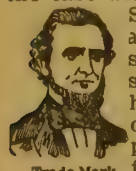
Worms in Children

Worms are a danger to the health of a child. Make sure that such is not the case with your child.



Signs of worms in children are: Deranged stomach, swollen upper lip, sour stomach, offensive breath, hard and full belly with occasional gripings and pains about the naval, pale face of leaden tint, eyes heavy and dull, twitching eyelids, itching of the nose, itching of the rectum, short dry cough, grinding of the teeth, little red points sticking out on tongue, starting during sleep, slow fever.

If at all doubtful, make certain of health by using Dr. True's Elixir, the Family Laxative and Worm Expeller. It's the one best thing for regulating the stomach and bowels and expelling worms. At your dealer's 35c, 50c and $1.00. Advice free. Special treatment for tapeworms. Send for book.

Knowlton, Que. Dr. True

SEAFOAM ELECTRIC

ITS ADAPTABILITY

There is no combination power washer and wringer on the market that adapts itself to such varied conditions in the home. Whether you are in the city or on a farm, you can use your Seafoam. It is designed to be operated by gas, gasoline, steam engine, electric or wind mill power. Full information on request.

DOAN'S KIDNEY PILLS

Relieve The Kidneys and Bladder Like Ordinary Medicines Do The Bowels.

When the kidneys get out of order the back is sure to become affected, and dull pains, sharp pains, quick twinges all point to the fact that the kidneys need attention.

Plasters and liniments will not cure the kidneys, for they cannot get to the seat of the trouble, but Doan's Kidney Pills do, and cure the kidneys quickly and permanently.

Mrs. Lizzie Melanson, Plympton, N.S., writes: "I am sending this testimonial telling you what a wonderful cure Doan's Kidney Pills made for me. For years I had suffered so with my kidneys I could hardly do my housework. I used several kinds of pills, but none of them seemed to be doing me any good. At last I was advised to try a box of Doan's Kidney Pills. When I had taken the first box I found relief. I have used five boxes, and to-day I feel like a new woman. I cannot recommend them too highly."

Doan's Kidney Pills are 50c. per box, 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

somewhat on the success of the producer in finding a good market and in obtaining eggs when the price is high. In raising pure-bred stock, extra time and special skill and attention are required, which must be deducted from the greater income received from a successful flock of pure breds.

The poultry manure is an important item which is sometimes reckoned as an offset to the labor. The product is about 100 pounds a fowl yearsly, or about a ton a flock of 20 hens. As commonly handled quite a large proportion of the product goes to waste in the yards and runs. If the manure is reckoned at 25 cents a fowl, it might pay for the care of the market flock under a good system. There is a place and a profitable one for different lines of poultry breeding for utility only. It is likely the demand is about equal among all general classes of poultry keepers, and the only way is to try various advertising mediums until customers are reached satisfactorily.—N. E. Homestead.

If Roup Affects the Poultry Flock Get Busy at Once.

A Mixture of Kerosene and Carbolic Acid Used Cautiously Usually Effects a Cure

Fall colds are generally found to some etxent in nearly all flocks of fowls unless extra precautions are taken. Colds are not roup but we might say it is roup in the first stages for if let run, that is sure what it will develop into. A bird that has once been infected with roup is ruined as far as the value of a breeder is concerned for the germs of the disease are left in the system of the fowls and they transmit it to their progeny. Therefore, breeding from fowls that have had the disease is to endanger the flock at all times.

The first step to prevent the disease is to house the stock properly. Provide for ample ventilation at all times. Fresh air is absolutely necessary in order to maintain the health of the flock. House the birds properly, set eggs from none but the healthiest stock and there is practically no danger from the outbreak of roup.

Colds first start with a running at the nostrils and can often be detected by the bird sneezing and throwing its head as if to clear the throat and nostrils. If taken at this stage they are not so hard to cure. While these are just simple colds they will, if neglected develop into very bad cases of roup. The following method is one that often brings good results and can be relied upon. Use a medicine dropper or a small machine can will answer the purpose, using about half a pint of kerosene which contains eighteen or twenty drops of carbolic acid. Place the finger just below the eye on the fowl and press down toward the opening of the nostril pressing out all the matter that will be discharged. The nostrils become clogged up and it is necessary to have this all cleaned out well before using the medicine. Now squirt a drop or two in each nostril holding the bird's head up well so it will run back into the nostril. Repeat this process until a cure is effected. Enough permanganate of potassium should be placed in the drinking water to turn it to a pink color.

Roup can be cured but after it has run long enough to develop into a bad case I never think it pays. If the head and eyes become swollen grease them with a grease made from one ounce of carbolic acid added to a pint of linseed oil or vaseline.

Roup may be cured unless in the very last stages. One must have patience as it usually takes ten to fifteen days to effect a cure and not in one or two days' time. Watch your flock closely and if you see one that is sick remove it at once. By careful watching we may be able to keep this disease down.—O. M. Allen.

Turkeys Shift for Themselves.

At persent I have no turkeys, but I used to put about 15 eggs under each hen and when the young had been out of the shell one day take the turkey and little ones to some distant part of the farm where there was timber or brush for cover and where they were not likely to be disturbed. Before putting hen with poults I dust her with some lice killer and when set to roam securely fastened a small bell to her neck. She was then left to shift for herself and her brood. I gave them no feed of any kind till fall, when they would be half grown or more. Then if they were to be sold as breeders they got light feed. It cost me something to learn that an overfed turkey, old or young, is likely to soon be an unhealthy one. Usually the hen would lose three or four poults during the summer but the saving in time and feed would balance that.

Turkeys are half wild and shy and dainty in this way of feeding. They are not scavengers like ducks and hens. Left to themselves they will be hours getting a meal and travel miles to get it; where neighbors would be troubled an acre fenced to hold them will answer. Under such conditions they should be let out only when they can be looked after. They are cleanly in their habits and need pure air.

My turkeys always roosted out of doors. I have known them to stay on the roost continually for two days and nights during a winter blizzard, but have never lost one from cold and think a helathy turkey cannot be frozen to death in any Vermont winter. I prefer Indian wheat, oats, or buckwheat for feeding in the fall. I do not like corn or any soft feed. If a man is situated so he can raise turkeys in this way I think there is a good chance for profit in it.—Milo J. Owen, Orleans County, Vt.

What to Feed for Hard Shelled Eggs.

The feeding of hens for the production of hard-shelled eggs, not easily breakable in handling, is possible and demands attention. Shells vary greatly in strength. A strong, heavy shell is not nearly so likely to be broken by the jars, jolts and rough handling incident to ordinary shipment as a weak one.

DOCTORS RECOMMEND IT

Whenever a nourishing, strength-imparting, mildly stimulative tonic is required, Doctors do not hesitate to recommend

Wilson's INVALIDS' PORT

à la Quina du Pérou

because they know it is a combination of the food elements of rich, ruby Douro Grapes with the tonic properties of Cinchona---supplying every element to make rich, red blood, quiet the nerves and impart strength to every part of the body.

Big Bottle Ask YOUR Doctor All Druggists

H-6

Chemical analysis show that the shell of the egg is largely carbonate of lime, but that it also contains carbonate of magnesia, mineral phosphates and some organic matter. If strong shells are to be produced the mineral elements must not be lacking. Grains that ar ordinarily fed do not contain these mineral elemetns in sufficient proportions, and an additional and separate supply is necessary. Fortunately these mineral elements are available in much cheaper forms than in grains. Lime is the principal ingredient of oyster shells. Iron, magnesia and often phosphorus in many kinds of artificial grit, may be procured for about the same price, while these elements in grain would cost at least double these figures.

Bone meal contains phosphorus in appreciable amounts, besides lime, magnesia, etc., and while expensive, it is effective in giving the shell an evenness and fineness of teuxture which adds much to its strength. It is, therfore, often used as an ingredient for dry mashes for laying flocks, usually in amount varying from three to five per cent.

Eggs that won't break give the poultryman greater profits than eggs that will. Make your hens lay the nonbreakable kind.

Doctor Said Sciatica--- Rheumatism---Lumbago

But He Could Not Help Me, and Endorsed the Use of Dr. Chase's Kidney-Liver Pills.

Mr. Wm. Parker, 105 Cayuga street, Brantford, Ont., tells in the following letter of his remarkable experience with Dr. Chase's Kidney-Liver Pills: "My doctor treated me for some time for Sciatica, Rheumatism, Lumbago, but to no purpose, for I had to lay off work. The visiting officer of Sick Benefit called to see me and advised the use of Dr. Chase's Kidney-Liver Pills, stating that he had been cured of the same trouble by their use. I asked the druggist about them and he recommended them highly. Not being satisfied with this, I went back to my doctor, and when he said they were good I began their use. The promptness with which they enlivened the action of the kidneys and bowels was wonderful, and it was not long before I was rid of all my trouble.

"I was so bad that I could only walk by hanging on to a chair or the wall. My wife had to lace my shoes. Only those who have had this ailmetn can realize the way I suffered. I am writing this letter to let people who have my trouble know of these pills. You are at liberty to use this letter, and if anyone interested will call or write to me I will give every detail."

Write to Mr. Parker, enclosing stamp for reply, and he will verify this statement. He will do this out of the gratitude he feels for his cure and because he realizes how difficult it is to obtain the cure of these dreadfully painful ailments.

There are so many treatments recommended for rheumatism that you naturally doubt them all. Here is an opportunity for you to verify the cure and put this great medicine to the test. It will only cost you a quarter to try Dr. Chase's Kidney-Liver Pills. They get at the very foundation of rheumatism, and by removing the poisons from the system take away the cause of pains and aches.

Dr. Chase's Kidney-Liver Pills, one pill a dose, 25 cents a box, all dealers, or Edmanson, Bates & Co., Limited, Toronto.

The Messenger Maid

(Continued from Last Issue)

"I never forget," said the child gravely, and as he stooped over her he took her hands, and kissed one and then the other. Shy Isabel suddenly put her fresh lips to his cheek then, darting away, buried her face in the coverlet of the great bed.

Whack! a heavy riding-whip descended sharply with a resounding crack on the stout oaken door.

With a little startled cry, "He's come!" Isabel lifted her head and then started round. The old lady lay back smiling grimly on her pillows. The gilded stag on the wall pranced on its headlong career as before. There was no dark, narrow door, no wonderful young gallant with gay eyes and witching smile. There was only Major Walsh standing flushed and florid in the doorway, with something between a scowl and a smile on his face. Had it all been a dream then?

* * * * * * *

The cathedral bells were scattering their shower of fairy music over the crowding roofs of the oldcity of Antwerp, as on the day in May a stranger strolled across the Place Verte under the flickering spring foliage of the lime trees. He was a man in the middle thirties, and his fine worn face and the commanding grace of his tall figure drew many a glance after the beau cavalier, as the whispered comments called him. As his aimless walk brought him opposite the cathedral he paused a moment, then saying to himself, "Well, I have cause enough to give thanks," he joined the thin trickle of worshippers entering the great south door.

But he was no Catholic, and the service already going on did not hold him long. Presently he wandered down the vast nave till the lights on the altar seemed but a dim twinkle in the distance; then turning into a little memorial cahpel, he seated himself behind the great pillar at the entrance. He would fain be alone with his thoughts, and he had cause enough, as he had said, for thought and for thanksgiving too.

Time, the healer, had for ten long years been doing his work. Culloden was but a bitter memory. King George sat secure upon his throne, and by degrees the proscribed Jacobites were being allowed to return to their own country. Among those to whom this boon had been extended was Nigel Maitland, while, thanks to powerful friends, house and lands were to be restored to him. But it would be an empty house, to which he would return and a changed countryside. There was no one of his name to welcome him to Ledington. Calderside was in the hands of strangers. Then his thoughts wandered back across the gulf of the years to that memorable day, when on a child's warning he had escaped with bare life from Ledington.

Where was she now, that child who would be a child no longer? Her father he knew had been exiled soon after his own escape, then some years later, when he was far away in Spain, fighting the battles of France, since he might no fight for his own king, he had heard of Sir Hugh Calder's death. The war over at last, he had sought to find the widow and the orphan child to hom he owed so much, but he could find no trace of them. The full, crowded years of a soldier's life had rolled on like an effacing tide over these tender memories, yet he had never wholly forgotten a child's pure face, a child's innocent kiss, which had indeed more than once been like a protecting talisman carrying him scathless through many a wild scene of revelry.

Now on the eve of his return to the old surroundings (he was only waiting for the next packet to Leith) how clearly that last memory came back to him out of the mists of the past, even to the quaint sampler spread on the big bed in the great gilded bedchamber. But clearest of all was the little trembling figure, and the young steadfast face framed in a scarlet hood. "She must be a sweet maid now, wherever she be," he mused, recalling the dark, wistful eyes. "I never forget," she had said. Ah, if such a fair, gracious presence had been awaiting him at Ledington or returning to the old house by his side, what a different home-coming it would be.

Sudednly voices from behind the pillar struck through his thoughts.

"Can I not be alone, even here?" said a girl's voice.

"Pshaw! we are disturbing no one. We must come to an understanding—as well here as anywhere else," said a man's deep, hoarse voice.

"An understanding? I have never given you the least cause to misunderstand me," came the retort, swift and sharp.

"You know it is your mothers' dearest wish," went on the man as though he had not heard. "Does that not weigh with you now?" significantly.

"Ah, my poor mother!" bitterly.

"And she thinks she has good reason to urge it," said the other with the same heavy significance.

"You remind me of that" flashed out the girl. "For my mother's sake I would give you gratitude—oh, so fully, so gladly, but to strike a bargain—to buy me with your bounty and then to talk to me of love! Love!" with fierce scorn. "If you had a spark of common generosity—"

"Gratitude—generosity—pshaw! We needn't bandy words. All's fair in love and war,' 'said the man with a laugh. "You know I love you."

"God keep me from such love, then!" broke in the girl's voice, the intensity of her emotion only heightened by her low, guarded tone. "I was a child—I did not understand, but I see it all now. You have separated us from all our friends. You took a cruel advantage of my poor mother's misery to make us dependent on you—you! Oh, if I had known it, the bread I ate would have choked me long ago, but now that I do know—"

"Yes, now that you know, what then?"

"I will find means to support my mother myself, though I starve for it," proudly.

"Maybe, but you won't want to starve her, and starve yourself at the last," brutally. "No, this is sheer waste of words. Your mother wishes it, as if with her last breath. I want you. Want you! I've waited for you for years, for more than half your life. Am I to let the flower I've watched so long be plucked by another hand?" The man's voice deepened to a note of strained, hoarse passion. "Do you think you can escape me,—you, a girl alone, friendless, penniless among strangers? You're mine—mine—"

Behind the pillar Maitland stood irresolute. At first he had heard the voices as if they were part of the half dream into which he had sunk, then he made the unwilling listener's usual mistake of delaying too long to make his presence known. But at those last words, at the change in the man's voice, at the girl's faint gasping cry, his hesitation was at an end. He must stop this, come what might.

With as casual an air as he could, he strolled round the pillar. For an instant both speakers stared at him in blank surprise, then seizing the moment, the girl wrenched herself from the grasp the man had laid upon her arm, and sped away down the long aisle, not so swiftly though, but that Maitland caught a glimpse of the pale, pure oval of her face, and of great dark eyes dilated with wrath and dread. With one careless, contemptuous glance at her companion, a stount, elderly, gross-looking man, he followed down the nave. Where had he seen that face before? It seemed curiously familiar, it recalled some insistent memory—but what?

As he stepped out into the sunshine of the square, his foot struck against something soft. He stooped and lifted a little packet, which unrolled itself in his hand. Then he stood staring. Of all things in the world it was a sampler! A sampler? It was the very one he had been dreaming of! There was the quaint, steep-roofed house, the stiff trees, the doggerel lines, "Isabel Calder is my name." Little Isabel—no wonder her face had touched a vibrant chord. He had found her, then, and found her helpless, bullied by that old hound! A wave of unspeakable emotion surged up within him.

"Your pardon, sir," said a voice behind, quivering with rage, but curbed to half incoherent courtesy. "That belongs to a lady—a friend of mine."

Maitland faced round upon the speaker, and with the clue now supplied, recognition dawned again.

"The lady, I find, is an old friend of mine, too, Major Walsh. I shall restore her property to her myself. She is no longer 'alone, friendless, penniless among strangers.' I am Nigel Maitland, whose acquaintance you were once very desirous to make. If you are still of the same mind I am very much at your service," his hand instinctively grasping his sword-hilt, while he gazed steadily into the bloodshot eyes.

Walsh's eyes fell. He backed into the crowd. Perhaps he felt that his game was played out. Anyhow he knew himself to be no match now for the tall, athletic figure before him. Maitland turned away with a laugh. He had lost sight of Isabel, but no matter! He would soon find her now. Then his heart leaped, for there she was, coming towards him, her eyes on the ground, evidently seeking for the lost sampler. With one stride he was at her side.

"May I remind Miss Isabel Calder of an old friend and an old debtor, whom I hope she hasn't quite forgotten."

The girl started round. The pallor of her face was drowned in a sweet, sudden flush, the trouble in her eyes gave place to joyful wonder.

"You!" she uttered under her breath, as if the word had escaped without her knowledge. Then her face changed pitifully. "It was you, then, behnd the pillar? You heard?" she gasped.

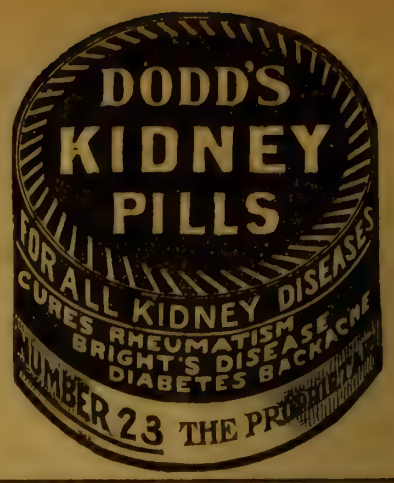
"Yes, I heard, and thank God I did. I know now why I sought my little friend in vain," said Maitland in a shaken voice.

That sweet flush, the glad unconscious welcome of her eyes had opened the flood-gates within. The tender twilight memories of his child-delivered, which had been hovering in his mind, now flamed at the sight of this fair and gracious girl into the glowing dawn of new-born passion, and all his being rose up to greet her. He knew his own heart now.

"Here, by God's rood, is the one maid for me," he, too might have said if he could have put the tumult of his feelings into words.

"You havent' forgotten the gilded room and the door behind the stag, have you, Isabel " he went on, his voice thrilling. "I said then that some dayI might be able to deliver you from Walsh. I little thought it could ever come true. The scoundrel won't trouble you again, but that's not enough. I'm a free man now; I'm going back to old Scotland—back to Ledington. Come with me, Isabel, come and make a home of an empty house. Your mother was a dear and good friend long ago. I think she won't grudge me now what would be dearer to me than life. She will come with us. Her own land, her own air will give her new life. Why should you linger here among strangers, when a home and a heart are waiting for you? Will you take then, Isabel? Will you come with me—will you?"

With his hands clasping here, his eyes holding hers, the girl was swept



BETTER THAN SPANKING

Spanking does not cure children of bedwetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

CONSTIPATION

Is Productive Of More Ill Health Than Anything Else.

If the truth was only known you would find that over one half of the ills of life are caused by allowing the bowels to get into a constipated condition, and the sole cause of constipation is an inactive liver, and unless the liver is kept active you may rest assured that headaches, jaundice, heartburn, piles, floating specks before the eyes, a feeling as if you were going to faint, or catarrh of the stomach will follow the wrong action of this, one of the most important organs of the body.

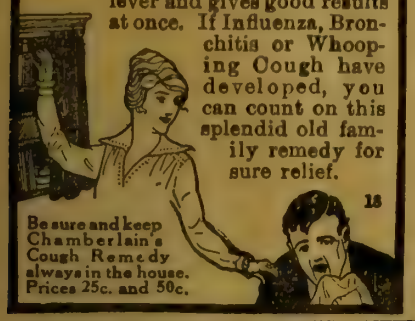
Keep the liver active and working properly by the use of Milburn's Laxa-Liver Pills.

Miss Rose Babineau, Amherst, N.S., writes: "Having been troubled for years with constipation, and trying various so-called remedies, which did me no good whatever, I was persuaded to try Milburn's Laxa-Liver Pills. I have found them most beneficial, for they are indeed a splendid pill. I can heartily recommend them to all who suffer from constipation."

Milburn's Laxa-Liver Pills are 25c a vial, 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

CHAMBERLAIN'S COUGH REMEDY

You can ward off many anxious moments if, at the first sign of a Cough or Cold, you will use Chamberlain's Cough Remedy. It loosens the phlegm, it heals the sore throat and bronchial tissues, allays fever and gives good results at once. If Influenza, Bronchitis or Whooping Cough have developed, you can count on this splendid old family remedy for sure relief.



Be sure and keep Chamberlain's Cough Remedy always in the house. Prices 25c. and 50c.

18

away on the glowing flood of his passion. If it was a hasty wooing there was no doubt of its utter sincerity, and after the long horror of her struggle with Walsh it was little wonder if Isabel yielded to it, and hailed her deliverer who had stepped into her life as suddenliy, as amazingly as the gay young gallant had appeared from behind the golden stag. The vague dreams she had half-consciously woven around him since that unforgotten moment had become bewilderinly true; when hope had been at the lowest ebb her Prince Charming had come to the rescue. A new world opened to her, as under the silken leaves of the young lime trees they wandered on, Nigel urging, persuading, pleading. Time seemed to stand still, the sunset was painting the western sky, when at last Isabel said shyly.

"I knew you, of course. It was little wonder I did, but how did you know me? I was only a child then."

Nigel laughed happily. "I wish I could say, too, that I had known you at once. I should very soon have known you, for the sight of your face knocked at my heart. but I couldn't doubt when I found this,' and he drew out the sampler. "What hapy chance made you carry it with you today? My dear love, what is it " as Isabel's look changed startlingly at the silght of the sampler, at the contrast between the miserable then, when she had snatched it up in an agony of despair, and tnis blissful now.

'It was no happy chance, but a very forlorn hope,' 'she said in a low voice. "The housewives set great store by needlework here. I thought if I took it to a shop I know—if it were seen—someone might employ me—I might earn my mother's bread and my own; his was poisoning me," she shuddered.

Nigel drew a long breath. "Thank God that's over," he said, as he gently drew her nearer to him.

With a melodious crash the bells from the soaring spire high above broke the blissful stillness which had fallen between them.

"Listen to the bells!" cried Nigel gaily, with a jerk of his shoulders as if he were 'casting dark days and dark memories behind him. 'Please God, we'll soon be hearing the old bell of Ledington kirk, and though it's cracked enough, it'll make better music than Antwerp chimes, for it'll be ringing in our wedding day and our welcome home."—The Girl's Realm.

Drowning Accidents.

How They May Be Prevented—Rules for Resuscitation—Treatment for Electric Shock

Every summer, a large number of lives are lost by drowning in the various bodies of water in Canada and particularly at summer resorts. Occasionally these are unavoidable accidents but most of them are due to carelessness and are preventable.

The first safeguard against drowning accidents is to know how to swim and it should be an esential part of every child's education. In England much more attention is paid to the instruction of school children in this useful and healthful form of exercise.

Children, after learning to swim, are liable to become too venturesome and should be cautioned not to take risks, as there is always the danger of cramps or heart failure due to the extra tax put upon the heart through exposure to cold water or through overexertion.

In rescuing the victim of a drowning accident great care must be taken by the swimmer. Do not close in rashly, but act warily and bear in mind that the only safe and ready way to subdue a frantic man in the water is to secure a hold from behind him. A simple and effective way is to lunge unexpectedly for his wrist, and, wtih a sudden, outward movement, spin him about, throwing your free arm around his neck. Once you have him thus you can, if he is submissive, grasp him by the hair or the neck of his suit and with a quick pull towards you, start him floating face upward, when you throw yourself gently backwards, and proceed to tow him in this position, or by swimming with your unhindered arm and the legs. As a last resort, a stunning blow on the head is effective.

The work of resuscitation includes the following:—

First—Freeing the stomach and air passages from water and mucus.

Second—Forcing the foul gases from the lungs.

Third—Replacing the foul gases with pure air.

Fourth—Inducing circulation.

Fifth—Restoring natural respiration. This of course is the final and essential aim.

1. Lay patient down carefully prone with face downward. Open mouth wide, and if foul with mucus or foreign matter, clean with hand or cloth. Stand across body, facing the head, pass your arms around the waist until your hands meet over the left side, interlocking the fingers in order to grasp the stomach between your palms. Force out the water by raising the body from the middle, at the same time pressing the hands together. Knead inward and upward under the ribs from the left side towards the centre. Press for four seconds, then relax, endeavoring to grasp more of the stomach pouch, until water ceases flowing from the mouth.

2. Place a pilow-like suport beneath the victim at the stomach. Turn his head to windward and crook his arm on the side opposite the face and rest the head in the bend of his arm.

3. Kneel over the patient facing the head with one leg on each side of the body. Rest your open hands on his back, thumbs near the spine, at the height of victim's elbow, with fingers spread over the lower ribs. Throw yourself forward with weight on your arm, and with steady, increasing pressure force the foul air from the lungs. After four seconds straighten up quickly releasing the ribs, so that they will spring back into place. Bend over again immediately to press for four seconds more, than streaighten. Continue this treatment until signs of life begin to apear. Make from twelve to fifteen respiration acts to the minute. Do not become discouraged if your efforts at resuscitation do not at first meet with success, as often a patient will respond after all hope seems lost.

Authentic cases are on record of victims having been restored to life after being under water for as much as half an hour, and it has at times taken as long as four hours to induce natural respiration in the apparently drowned.

4. As soon as natural breathing sets in strip the patient of all wet clothing, cover the upper body with something warm and dry and start rubbing the limbs with rapid strokes, first from the centre joints towards the heart and gradually working down in this manner to the extremities.

5. After massaging the patient put him to bed and if natural heat does not return promptly, distribute covered hot bricks or water bottles at the soles of the fet, over the stomach and under the armpits.

6. If necessary, give patient whisky, brandy or other stimulants, diluted in hot water. Administer in teaspoon or tablespoon does, every ten or fifteen minutes for the first hour, and as often as seems expedient thereafter.

Treatment of Electric Shock

Electric shocks suspend the action of the heart and breathing should be restored by artificial means.

Although the shock may appear to have been fatal, life may often be retored if action is taken without delay, and continued vigorously and patiently.

The steps to take are:

Remove the body from contact with the wire, cable, or other conductor by

So Good for Children

Millions of pounds of delicious "Crown Brand" Corn Syrup are sold every year to mothers, just for the children.

EDWARDSBURG "Crown Brand" CORN SYRUP

Mothers know it is practically all nourishment. They know it is a food—that Bread spread with "Crown Brand" makes a well balanced food that sustains and builds up the strength.

Mothers know, too, that "Crown Brand" is the *most economical "sweetening"* for all sorts of Cakes, Pies, Puddings and Sauces—and is the whole thing for delicious homemade Candies.

"LILY WHITE" is our pure white Corn Syrup—not so pronounced in flavor as "Crown Brand"—equally choice for the table and for candy making.

I. C. R. TAKES OVER LINE TO MUSQUODOBOIT

The Service in the Meantime Will Be on Tuesday, Thursday and Saturday, Leaving Dartmouth at 3 p.m.

Halifax, Dec. 31.—The operation of the Dartmouth to Deans branch of the government railway system will be undertaken on Monday, January 3rd. The trains will run from Upper Musquodoboit, leaving at 5:30 in the morning and arriving at Dartmouth at 10 o'clock in the forenoon, thus making the run of 70 miles in four hours. Returning the train will leave Dartmouth at 3 o'clock in the afternoon arriving at Upper Musquodoboit at 7:30 o'clock in the evening. The trains will run on three days each week—Tuesdays, Thursdays and Saturdays. It will be a mixed service-passenger and freight. Cavicchi and Pagano, the contractors who built the road, have been running the service for some months and have thereby been a great convenience to the people travelling from Halifax to Middle Musquodoboit. Now it is to be undertaken by the I. C. R. as a branch of the system that extends from Halifax to Winnipeg. The desire of the people on the shore and through the Musquodoboit valley is at last to be gratified with the operation of the road as a part of the I. C. R., and in this respect the beginning of 1916 will be memorable. It will be noted that the road in the meantime will be operated not to Deans, but to Upper Musquodoboit.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

breaking or disconnecting the circuit; dragging the patient away by his coat-tails, the hands being protected by rubber gloves or any dry wollen material, such as a cap, folded several times or with a stick or any non-conducting material.

If posisble, without discontinuing the treatment, send for a doctor.

After removal do not wait to undo the clothing, but proceed to restore breathing by the same method as described above for drowning accidents.—W. J. D.

Letting one's Self Alone.

An article in a recent number of the Mother's Magazine apepaled to me and I believe it will to others. It is as follows:

"One of the important things to know in life, especially if you are a woman is how to let yourself alone. The ability to relax, the art of being judiciously lazy, the tact to let herself alone, has saved many a woman from a nervous breakdown. We all know the housewife who nags herself into such a state of consciousness that she cannot rest. If she lies down, she is continually worrying herself with thoughts of the work she is neglecting.

"Much of the blame for this state of affairs lies at the doors of the mothers. The mistake is in their training of their children, especially their daughters. They are taught from earliest infancy to be kind to others, to bear with them, to forgive them, to help them; but from birth to death, no one ever tells them to be kind also to themselves.

"The woman who nags herself can make herself more miserable than any one else possibly could. She can make her life more of a nightmare than any misfortune could possibly make it. If such women could learn to be kinder to themselves, there is no doubt that their own lives would be lengthened; and not only that, but the lives of those with whom they come in close contact would be made far more pleasant."—B. F. Coen, Colorado Agricultural College, Fort Collins, Colorado.

More Use of Cereal Foods.

Oatcakes.—There are various ways of making oatcakes, according as they are desired thick or thin, rich or "water." For an ordinary (not too thick) oatcake, put two or three handfuls of oatmeal into a bowl, add pinches of salt and baking soda, and then stir in one dessertspoonful of melted dripping or lard, and moisten with just enough boiling water to form a firm dough. Knead the cake very firmly, strewing the baking board well with meal. Roll out quickly to about a quarter of an inch in thickness, cut and fire one side of the cake on a hot gridle, and toast the upper side before the fire. Failing a gridle, the oatcakes can be baked in the open; they should take about fifteen minutes in a fairly quick oven.

Wheatmeal.—In its natural state wheat contains every element of nutrition necessary for the support of the human body, and in gluten it is very rich, containing 12 per cent. of that valuable matter. The virtue of eggs, milk and beef may, indeed, be said to be combined in wheat, not the wheaten flour from which our white bread is made. By the time that wheat has gone through all the various and ingenious processes which are necessary to bring it to the required degree of refinement, its character as the "king of grains" is gone. It is not in its whiteness that the value of a loaf consists; brown bread is far more healthful and forms a more perfect food than does white bread. Although it would not be wise to adopt brown bread as the only form of loaf, even in war time, the establishment of its use should be retained in every household.

SERVICE

THE THIRD BRANCH OF BUSINESS

There was a time when business consisted of but two branches—buying and selling. They were fundamentals, of course, but they were the only fundamentals recognized. We have added a third great branch. We call it SERVICE. It goes into every transaction we have, and stands back of every vehicle we make or sell. It's your guarantee of QUALITY, PROMPTNESS AND SQUARE DEALING.

You will receive the benefits of this service when you buy from a dealer in Nova Scotia Carriages.

If there is no dealer near where you live, and you are in need of anything which we manufacture, we would appreciate a letter from you and would be glad of the opportunity to serve you by arranging for our nearest dealer to call upon you.

Nova Scotia Carriages, Ltd.
Manufacturers of Quality Vehicles.
AMHERST, N.S.

Wheatmeal Bread.—Sieve ½ lb. or ordinary flour into a bowl, then add ¾ lb. of wheaten meal (unsieved). Now add one teaspoonful of caster sugar, half a teaspoonful of salt, one small teaspoonful of bicarbonate of soda, and one small teaspoonful of cream of tartar. Rub in 1 oz. of salt butter or lard, and one teaspoonful of syrup, and then stir in sufficient sweet milk to form a good dough. Turn on to a floured board, form into shape, and place in an oiled or buttered cake or loaf tin. Set before the fire to rise for a quarter of an hour, place in a moderate oven and bake for one hour.

Wheatmeal Scones.—These can be made from the same recipe as the loaf, but make the dough of a slightly firmer consistence. Turn the dough out on the floured board, knead it slightly, roll out, cut into shapes according to taste, place on a floured baking-tray, and bake in a quick oven for ten or twenty minutes. Cool the scones on a wire tray.

Wheatmeal Porridge.—If any difficulty is experienced in the digestion of oatmeal porridge, wheatmeal porridge will prove a most excellent substitute. This finds a place already in many homes, alternating once or twice a week with oatmeal. The economy of these foods in this time of national stress cannot be too highly estimated, but their value is probably even greater as an asset to the health of the people. Bring sufficient water to a boil in a pan for the required amount of porridge. Let the amount of meal be in proportion of 8 oz. to the pint of water in the pan. Moisten the meal in a small basin with cold water, making it smooth with a wooden spoon. Stir the moistened meal into the pan, stir briskly until the porridge boils and lift the pan to a part of the stove where it will boil gently, put on the lid, and cook steadily for forty minutes or one hour. Add salt to taste, boil up briskly and stir well before dishing. Serve very hot with good sweet milk or cream.

Barley Meal.—Barley meal has virtues of its own quite apart from oats or wheat, and its digestive qualities exceed them. At the time of the South African War it may be remembered that during a famous siege, when food was running very short within the town, a soldier from the highlands of Scotland helped to save the life of the garrison by teaching the men to make "sowens," a kind of thick porridge jelly. What is known in England as "flummery" is practically the same as "sowens"; the Scotch variety is made from the husks of oats, or preferably barley, which are put to steep in tepid water, and then allowed to lie for two or three days. The liquid is then poured off the husks and boiled in a pan for about ten minutes; served with syrup it is quite delicious.

Barley Soup.—Pearl barley is the first form in which the grain can be obtained. This recipe for soup is very excellent. Required: Take 2 lbs. boiling beef or 3 lbs. neck of mutton; one small turnip, cut in dice; one carrot, cut in julienne shreds; one onion, skinned, scalded and sliced; two leeks, carefully washed and sliced; 4 oz. of pearl barley, salt and pepper, and cold water, parsley and celery in season. Method: Wash the barley thoroughly, and put in a pot with four quarts of cold water. Bring it to the boil and

The Misfortune of a Wrong Start.

Hundreds of boys and girls leave the Grammar and High schools each year to accept minor positions in the business world. They are forced to undergo the humilating experience of having graduates of good business schools placed in positions ahead of them. Promotion is comparatively slow for the untrained. These young people regard the business world as an unsympathetic place. If their ambition is not killed entirely, they start again right, by taking a business course.

It will pay you to attend the Moncton Business College.

Geo. J. Schmidt, Principal
Moncton, N. B.

I Wish to Thank the Public

for continued generous patronage and to intimate that our new term begins Monday, Jan. 3rd.

add the vegetables, which have been already brought to the boil in a small pan of cold water and that water strained away. Wipe the meat and add it after the vegetables. Season with salt and pepper, and simmer slowly for three or four hours. Just before serving add one dessertspoonful of chopped parsley. Dish the soup in a hot tureen. Serve the meat with white sauce, or dress it, and serve in any way, according to taste

Barley Scones.—Take 1 lb. of barley meal, put it in a basin with one teaspoonful of salt, one small teaspoonful of caster sugar, and one teaspoonful of bicarbonate of soda. Mix all well together, then stir in with a wooden spoon sufficient buttermilk to form a stiff dough. Roll out on the baking-board, cut into neatly shaped scones, and fire on a good hot gridle, turning the scones very carefully when the underside is cooked. Sir Walter Scott, in the "Fair Maid of Perth," referred to such scones as these when he said "barley scones to whiten your teeth."

Highland Barley Scones.—This is a very old recipe, but no more delicious novelty can be placed upon a breakfast table today. They must be freshly made from really good barley meal. Put 1 lb. of barley meal in a basin with one teaspoonful of salt, and mix these together. Stir in quickly sufficient boiling water to make a stiff dough. Knead very quickly and form into an oblong roll. Cut off a small piece, roll in a little meal on the baking-board, and flatten out to a very thin scone. Place on a hot gridle, and proceed to form the rest of the dough into scones in the same way. The scones must be fired on both sides as quickly as possible. Failing a gridle, an oven shelf makes a good substitute and may be used equally well over a closed range or a gas cooker.—Muriel Sutherland, in "The Queen."

Officers of the M. S. B. A.

For the first time in its history the Maritime Stock Breeders' Association were able to report the financial balance on the right side of the ledger. This organization manages the Winter Fair and Horse Show annually held in Amherst, and their ambition to separate themselves from an annual deficit has at last been reached. The association regretted being temporarily forced to lose the assistance of Colonel H. Montgomery Campbell, who is now in command for the 64th Battalion, and has been president of the association for some years. The new officers elected at the annual meeting held at Truro, N.S., on the 5th inst., are:

President—A. E. Trites, Salisbury, N. B.

Vice-president for New Brunswick—W. W. Hubbard, Fredericton.

Directors for New Brunswick—R. A. Snowball, Chatham; W. S. Harding, Hammond River, and A. Avard, Sackville.

Vice-president for Prince Edward Island—Hon. M. McKinnon.

Directors for Prince Edward Island—James F. Roper, Charlottetown; J. M. Laird, Kelvin Grove, and Walter M. Lea, Victoria.

Vice-president for Nova Scotia—S. A. Logan, Amherst.

Directors for Nova Scotia—W. W. Black, Amherst, John O'Brien, Windsor Forks, and W. L. McFarlane, Fox Harbor.

Secretary and manager—F. L. Fuller, Truro.

It was decided to hold the Horse Show and Winter Fair this year at Amherst as usual, providing the building was available.

Maritime Holsteins in R. of M. and R. of P.

In the list of Holstein-Friesians making semi-official records from October 1st to November 30th, 1915, Artis Rosie, 9808, a five-year-old cow owned by the Nova Scotia Agricultural College, Truro, N.S., leads the mature class with 751.25 lbs., butter from 16318 lbs. milk. A three-year-old cow in the same test made 898.75 lbs. butter and takes second place for Canada in her class. The cow in question is Lilith Pauline Calamity Jane 3rd, owned by J. M. Steves, Steveston, B. C.

In the official records of the same period we find in the three-year-old class the name of Fay De Kol 2nd, 21265, owned by A. E. Dickie, Central Onslow, N.S., with a record of 412.2 lbs. milk yielding 16.10 lbs. butter in seven days.

One of Samuel Dickie's four-year-old cows, Cobequid Helbon Princess qualified in the record of merit with 514.9 lbs. milk yielding 21.64 lbs. butter in seven days.

Vegetable Seed Situation.

The following extract of an article from a newspaper of Gothenburg, Sweden, will be of interest to growers of vegetable seeds. The article refers to the Board of Directors of the Agricultural College of Alnarp, Sweden, asking for a government grant for the encouragement of vegetable seed growing.

"The board points out that the war has most clearly emphasized the importance, for the country, of home production of vegetable seed. Owing to the most important vegetable seed producing countries having prohibited the export of such seed, the prices of a great number of important vegetable seeds have risen enormously. And, still worse, some seeds can hardly be obtained at any price. It is reported, from a well informed source, that vegetable seed growing in the countries engaged in the war has been largely neglected during the past summer and that for this reason further advances in prices can be expected. Reports from Germany state that the supply of seed of spinach, carrots, most kinds of cabbages, onions, cucumbers and peas is utterly small. Furthermore, Germany has prohibited the export of vegetable seeds to the end of the war. There is therefore every reason to fear that we have to face the possibility of a very serious shortage of certain vegetable seeds."

The Farmers' Advocate says: "We never like to see a judge discussing classes with anyone privileged to be in the ring, before the awards have been made. It leads people to ask, "Who is the judge?" To this the Maritime Farmer says, "Amen!"

There was no cause to complain about this matter at the recent Maritime Winter Fair. Each and every judge attended strictly to business and did not converse with any persons in the ring or out of the ring until after the awards were placed.

The Maritime Farmer
SUSSEX, N. B.

Starting a Farm School.

(By W. A. Craick, in Farmers' Magazine, Nov., 1915.)

A good many years ago, a young man came to the little town of Woodstock, N.B., from the provincial capital at Fredericton, and hung out a sign over a door in the main street. It read, "L. P. Fisher, Barrister, etc." Ten year ago this same individual, grown old and feeble, passed away and was buried in the town cemetery. When his will came to be opened and read, it was found that, after making several small bequests, all his property was to be administered for the educational and social advantage of the community in which he had spent his professional life.

Today a visitor to the beautiful town on the St. John River will have pointed out to him four buildings. On the northern border of the town, he will be shown a big, white residence of rather ornamental aspect, looking down from a height on the river. This, he will be told, was the imposing mansion which the late Mr. Fisher built for himself and which he gave on his death to be converted into a hospital —the L. P. Fisher Memorial Hospital. Somewhat nearer to the centre of the town, rises a large brick structure of considerable size and effective appearance, over the front of which stands inscribed the words—The L. P. Fisher Memorial School. Inside, if you hap pen to have the curiousity to enter, you will find an interior so splendidly furnished that you will rack your brain for a long time to recall the existence of a finer public school building in any town of like size.

On a prominent corner of the main street, there will be pointed out to you with pride, the L. P. Fisher Memorial Library, a building that would shame a more pretentious Carnegie institute elsewhere. At last, but by no means least, you will be shown a plainer building than the others, placed some distance along one of the residential streets, and inscribed, the L. P. Fisher Vocational School. It is in the latter, if you happen to be an agriculturist, that your greatest interest will doubtless centre.

Eccentric or Idealist?

The late Mr. Fisher was evidently an eccentric sort of a person, but just what his characteristics were I have not been able to gather. Some would have it that he was a bit of a miser, others that he was inspired with lofty ideals for the good of humanity, which would be worked out after his death. Be that as it may, he at least did one thing and that was to accumulate considerable wealth. Indeed, his estate seems to have panned out far better than he himself ever expected that it would and already a good many thousand dollars have been expended by the trustees in the erection and equipment of the institutions mentioned.

By an arrangement between the Fisher Estate and the provincial government of New Brunswick, the Woodstock Vocational School was built and adapted for use as an agricultural school. It is the first of three such schools, which are to be operated in the province. The second at Sussex has just been completed this summer. The third has not yet been started but it will be located eventually at some point in the north-eastern section. The three together will provide opportunities for the sons and daughters of farmers living in their respective vicinities to secure special training in agriculture and domestic science.

For the time being and until such time as the work of the agricultural school demands more accommodation, the main floor of the Vocational School is under the jurisdiction of the Woodstock School Board, while the upper floor and the basement are reserved for the agricultural courses. On the main floor the children attending the local public schools are taught manual training and domestic science. The equipment for this purpose is excellent, and the work being compulsory, every boy and girl in town gets a certain amount of instruction in these useful arts.

The work of the agricultural school is quite distinct from the public school work. Indeed, eventually it is expected that another vocational school will be erected for the exclusive use of the town children, while the present vocational school will be given over entirely to the Departmetn of Agriculture.

"So far we have not got past the short course period," explained Mr. Newton, Principal of the Agricultural School, when I asked him to outline New Brunswick's scheme of agricultural education. "We held a short course here in March, 1914, and a second short course this spring. The Minister of Agriculture, Mr. Murray, hopes to make a trip soon to inspect agricultural schools elsewhere. Mr. Steeves, the director of elementary agricultural education, myself and others will probably accompany him. After that we will be in a position to devise plans for establishing regular courses in the schools.

"Last summer we began a summer science course for rural school teachers, lasting eight weeks. The attendandce reached 86 which we consider very gratifying for a start. This year in addition to the 86, who will come back for the second course, we expect to have nearly 200 more. The work this time will be divided between Woodstock and Sussex, as the Sussex school is now ready for occupation.

"Our short course work has got very nicely started. This year we held six-week courses at Woodstock, Sussex and Newcastle, all of which were well attended. To interest the girls, we also arranged two-week courses in household science, which were held at Woodstock, Chatham and Sussex.

Experimental Union Organized

"In connection with the schools, we have organized an experimental union similar to the one at Guelph. Last year some interesting results were obtained. Our efforts have been directed specially to investigation work with the root crops, but we have also studied alfalfa, corn and red clover. So far as alfalfa is concerned, we have not yet met with much success, though we have had some striking instances of favorable results and are hoping for general progress."

The Woodstock School seems to be well adapted to the purpose for which it was intended. It is well-built, well-lighted and comomdious. In the basement, which is floored with cement, there is a large room, into which cattle can be brought for demonstration lectures. It is surrounded by a raised wooden platform on which seats are

This is what you need

To Cure
Nerves, Stomach, & Kidneys.

Rx Powerful Nutrients. Hypophosphites, Nerve Restoratives, Valuable Stomachics.

Dr. Cassell's Tablets are a genuine remedy for all forms of nerve, stomach, and kidney trouble in old or young. They are composed of carefully chosen ingredients, each one of which has definite restorative action on the nerve centres controlling the various processes of life; and thus they give new activity to the bodily organs, and new vitality to the entire system.

Dr. Ramsay Colles, J.P. of the City of Dublin, a man of high eminence in the scientific world, says:—"I have great pleasure in expressing my satisfaction as to the curative effect of Dr. Cassell's Tablets in cases of nerve troubles. From several cases which have lately come under my notice I am able to form the opinion that Dr. Cassell's Tablets constitute a safe and reliable family remedy, and appear to be specially effective for nerve and bodily weakness."

Dr. Cassell's Tablets are Nutritive, Restorative, Alterative and Anti-Spasmodic, and of great Therapeutic value in all derangements of the Nerve and Functional Systems in old or young. They are the recognised modern home remedy for Nervous Breakdown, Nerve and Spinal Paralysis, Infantile Paralysis, Rickets, St. Vitus' Dance, Anæmia, Sleeplessness, Kidney Disease, Dyspepsia, Stomach Catarrh, Brain Fag, Headache, Palpitation, Wasting Diseases, Vital Exhaustion, Loss of Flesh, and Premature Decay. Specially valuable for Nursing Mothers and during the Critical Periods of Life.

Druggists and Dealers throughout Canada sell Dr. Cassell's Tablets. If not procurable in your city send to the sole agents, Harold F. Ritchie & Co., Ltd., 10, McCaul Street, Toronto; one tube 50 cents, six tubes for the price of five. War Tax Extra, 2 cents per tube.

Britain's Greatest Remedy

placed. The same room can also be utilized as an assembly room, the open space being filled with collapsible chairs. On the opposite side of the basement there is a large utility room, where blacksmith work will probably be handled. During the short courses it came in handy for practical work in tree planting, pruning and similar work.

On the upper floor there are the offices of the principal and the instructors, lecture rooms and laboratories. These have not yet been fully equipped, but it is expected that they will soon be ready for the regular work of the school.

These New Brunswick schools are in the main like the Alberta schools and will fulfil about the same functions. They will serve certain sections of the province, giving opportunities to the young men and women to secure instruction without the necessity of undergoing heavy expense. Even in the vicinity of Woodstock itself there must be hundreds of young people who stand t benefit materially by the establishment of the school, for the town is right in the middle of a splendid agricultural district.

Hitherto agricultural education has been a minus quantity in New Brunswick. It is quite true that the province would pay the fare of a student to and from an agricultural college elsewhere, but that concession only benefitted a very few. Now, with schools at their very doors, there will be no excuse for further delay and one may hope as a result to see a very decided improvement in farming methods in the province.

Use Formalin to Destroy the Spores of Smut in Oats.

Smut is a fungus disease caused by minute colorless plants called fungi which have lost the power of manufacturing their own food and have become thieves and parasites stealing what they require from other plants and in so doing injuring them in various ways. The bodies of fungi which cause smut consist of fine, delicate threads or cubes which are so exceedingly small that they can only be seen with the aid of a microscope. These live between the cells of the grain plants and obtain their nourishment from them. Some of these fungus threads become changed and produce reprodutcive structures termed spores, which serve the same purpose as the seeds of flowering plants, namely dispersal and reproduction.

Oat smut can be prevented by treating the seed wtih formalin, either by dipping or sprinkling the solution. If the dipping method is preferred mix one half pint of formalin (40 per cent formaldehyde) in 21 gallons of water. Place the seed to be treated in a coarse sack; a bran sack is excellent for this purpose. Fill the sack about three parts full and immerse in a formalin solution about twenty minutes. During the treatment raise the sack up and down two or three times in the solution to insure wetting every grain that it contains. After treating, spread out the grain thinly on a clean floor where it can be stirred and allowed to dry sufficiently to be sown. Of course it is well to remember that this work should only be undertaken just previous to the grain being sown. The sooner it is sown after treatment the better. Twenty gallons of solution will treat about twenty bushels of the grain. Sereral treatments may be given with the same solution, but each lot will be required to be immersed for twenty minutes.

If the sprinkling method is adopted, mix one pint of formalin with forty gallons of water. Place the grain to be treated in a heap on a clean floor and sprinkle the formalin solution over the grain. Then shovel the grain over to another pile so as to mix it thoroughly, then sprinkle and shovel again. Repeat this until every grain is moistened by the solution, then cover the pile with sacks and leave for three or four hours. At the end of this time spread the grain out thinly to dry. Shovelling it over thre or four times will hasten the drying process. Forty gallons of the formalin solution is sufficient to sprinkle between thirty and forty bushels of grain.

Heifer calf, $33.00, Brenton Miller, Schubenacadie, N.S.

Stick to Type.

At the recent meeting of the Holstein-Friesian Breeders' Association in Syracuse, New York, the president of the Association, D. D. Aitken, said a few things in regard to the relative importance of fat percentages and conformation that may well be kept in mind by all breeders of dairy cattle put on production records.

"Without a fixed standard or guide," said Mr. Aitken, "and with the retrograde influence which accompanies all efforts at improvement, we shall lose sight of those characteristics which are vital to continued success. Size, vigor, hardness and pleasing symmetry of form can be maintained only by unceasing effort, and these are in no way incosistet with high production. The scale of points must not be even slightly obscured by the dazzling glare of phenomenal fat percentages of the pedigree. Too early and too frequent breeding, and neglect to grow the animal in its youth, are the besetting sins in this connection."

Right. We want great individual producers, but above all we need strong herds and great breeds.

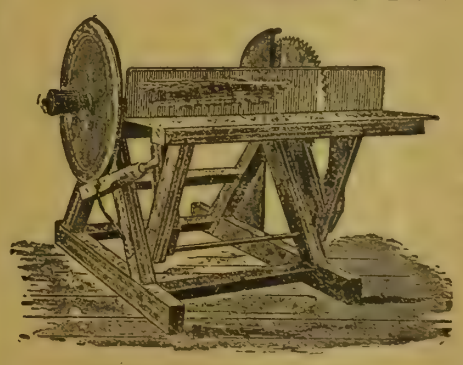
Change of Time January 9th.

On Sunday, January 9th, the Maritime Express will run daily between Halifax and Montreal, leaving Halifax at 3.00 p.m. Connection will be made at Moncton to and from St. John daily. The Ocean Limited will not leave Halifax Sunday, January 9th, but will leave on its present schedule time 8.00 a.m. daily except Sunday thereafter. Its continuance during the winter months will be pleasing news to thousands of travellers to whom the "Ocean" appeals as an express train of excellence in service and comfort in travel.

From Montreal the Maritime Express will leave on its present schedule, 8.15 a.m., daily and the Ocean Limited, 7.25 p.m., daily except Saturday.

Sussex Wood Cutters Cut Expenses

Consult Our Quality Line Before Buying



Short Swing Wood Cutter

Wood Cutter Saws guaranteed at the right price. All sizes. Prompt delivery.

Flat Roller Table.

CONVENIENCE ECONOMY DURABILITY

are the three money-making qualities embodied in our Wood Cutting Machines. No frail parts to give out in a season's use. Built to last a life time. Frame is made of well seasoned birch, bolted and mortised; table of heavy steel plating in one piece.

Swing Table Machines built on skids, bearings supplied with compression greese cups. Especially adapted for use with gasoline engines. Made in four styles—Long Swing, Long Swing Improved, Short Swing, Flat Table.

Ask for our Catalogue and Prices, it will pay you.

Remember we also manufacture Trenholm Gear Hay Presses, Grain Grinders, Root Pulpers, Feed Boilers, etc.

Volume 21. SUSSEX, NEW BRUNSWICK, JANUARY 25, 1916. Number 8.

For a United Policy re Agricultural Education.

Secure Better Results and Save Public Money--Opening New Science Building N.S.A.C.

Important pronouncements marked events at the Agricultural College, Truro, on the evening of January 11th. For the past few years big things have had the habit of transpiring in connection with this provincial institution, but it is doubtful if any previous utterances meant more to the Province of Nova Scotia. They came from three sources, Dr. C. C. James, Commissioner of Agriculture for Canada; Hon. J. A. Murray, Minister of Agriculture for New Brunswick, and Hon. G. H. Murray, Premier of Nova Scotia.

The first named was present for the purpose of officially opening the new Science Building in connection with the Agricultural College. This event took place in the lecture room of the new building. The building was crowded to its utmost capacity, the crowd overflowed all through the many rooms and many were debarred the privilege of hearing the Doctor's eloquent speech. The meeting was to have been presided over by Miss Jennie A. Fraser, superintendent of Women's Institutes, but illness prevented her being present, and Principal Cumming filled the chair. In introducing Dr. James he referred to him as the foremost figure in agricultural education in the Dominion, and the compliment he paid the College in coming from Toronto on this occasion.

Congratulated Nova Scotia

Dr. James was tendered an ovation, and in reply treated his hearers to a masterly presentation of the urgent needs of education along the more practical lines, the lines which dealt with the problems of daily life. He congratulated Nova Scotia on its lead in Canada in technical education, but even at that it did not go far enough. The outstanding need was for an education suitable for people in rural life. His own province—Ontario—boasted of its educational features, but of its four thousand schools there was not one that did not tend to educate the young man and the young woman away from the farm. He spoke of one school established in Alberta along practical rural lines and saw in attendance at it 120 young men and 60 young women all eager for a practical education. He congratulated the Agricultural College at Truro on the new Science Building. Its purpose was to educate the women and girls of the farm and better the home life in the east. The new building was as good as any in Canada for the purpose. The work of education of the women was the most important that could be undertaken. and he believed that a great blessing was in store for the women in rural parts of the Province should they take advantage of the opportunities this new school offered.

Ovation for Soldiers

At this junction the crowd in the building became so large that it was found necessary to adjourn to the larger assembly hall in the main building. Here, too, the capacity of the hall was taxed, and among the audience were many members of the 106th Rifles. To them was accorded seats of honor in the front, and the immense audience rose to its feet and cheered the boys in khaki as they entered the hall.

THRESHING CLOVER SEED IN QUEBEC

The above is a clover huller at work at Lennoxville, Que. It was purchased cooperatively by the farmers of the district, and this year threshed a very good crop of seed. When the farmers grow their own clover seed they will sow more pounds to the acre, seed more annually, reap better crops and have more fertile farms.

A Truro exchange recently said:

"A clover seed thresher was in our vicinity last week under the management of Willard Thompson of River John and Clifford D. Langille of Marshville.

"It is through the influence of the managers of the Agricultural College, Truro, that this thresher is sent out in the country, and it is also an experiment of theirs, which we think will prove successful. This thresher has only been in the country districts now for three weeks, starting in the vicinity of River John and taking in the country from there to here in that time.

"The clover thresher and gasoline engine, which is its power, are both on portable trucks. The thresher looks something like a comomn grain thresher, but it is somewhat larger.

"We are told that after the clover seed is threshed out of the clover and hay that it does not at all injure the hay.

"In an interview with Mr. Thompson, one of its managers, he told us that it was the only machine, or rather, clover thresher, in the Maritime Provinces, it having been brought down from Ontario; also that it was to be sent throughout the three counties, Colchester, Pictou and Antigonish.

"The farmers in our vicinity should all take this opportunity of having the clover seed threshed out of their hay and clover, as you all know what a high price clover seed was last spring, which was about 22 cents per pound, and today it is from 25 to 29 cents per pound, and is steadily on the increase in price. In River John, after the thresher passed through, the farmers who did not have their clover threshed are now regretting the fact; so we again repeat, take this advantage and have your clover threshed, then it will not have to be imported from Ontario as formerly.

"After this experiment has been made in the aforementioned counties this machine will be put on the market for sale."

Premier Murray's Address

When order was resumed Principal Cumming introduced Hon. G. H. Murray. The premier was in fine form. He caught the enthusiasm of the audience and was closely followed throughout his address. In a general way the premier referred to the duty of guaging public opinion that confronted a public man. He dealt with the surprising changes in this regard in consequence of the outbreak of the present war, but on one score he felt that there could be no mistake and that was the great question that now confronted the people of Canada—the question of an education that dealt with the problems of the daily life of the farmer, the miner, the fisherman and the lumberman. The most valuable asset Canadians had was land. The land had attracted thousands to homes within its borders and of all Canada he believed Nova Scotia was the most blessed. "We are not so optimistic as in the West," declared the speaker, "but take it from me, a man on the farm who works as hard, gains just as profitable and an easier livelihood than any in the west. While lacking the boast we have the assets."

He then turned to the subject of closer co-operation in improving interests common to three Provinces in the East. On the subject of farming New Brunswick, Prince Edward Island and Nova Scotia could get together on common ground.

It was a common problem. To talk of legislative union opened a question for diversity of opinion and discussion, but with respect to the [illegible] problem they could pursue a united policy. He could see no reason why the three provinces should not stand together on this subject of agriculture secure better results, and save public money. He hoped a commencement, as a result of this gathering, would be made. He and the other gentlemen met not as policitians, they were not talking as party men, but to stimulate education in the interests of the great national resources, so that the men and women of the future might be better able to take every advantage of the wealth of these resources.

The Science Building to educate the women was a grand step, and one that commended itself to all thoughtful people. He thanked Dr. James for his kind expressions of the Province and its educational progress.

Good Word for Soldiers

Premier Murray then had a word to say to the soldier lads in the front of him. It was this:

> "Boys, if you are as good men as the Canadians who have gone before to France, your country will be proud of you. I believe you are."

The speaker referred to the splendid generosity of the people of Nova Scotia, in appeals for the Belgian relief and all other patriotic purposes. They might ask the question, have we done enough? Living in this land of plenty no one had suffered, but in devastated Poland and Belgium there had been suffering. Other calls would be made and the people would give. They were ready to respond, he believed. and share their bounties with those who had suffered in this righteous war.

(Continued on Page 265)

N. S. Fruit Growers in Annual Session

Fifty-Second Annual Convention.

The fifty-second annual meeting of the Nova Scotia Fruit Growers' Association was held in the Opera House, Wolfville, on the 18th, 19th and 20th inst.

The opening meeting was called to order by A. E. MacMahon, president of the Association, whb read the customary presidential address, after Dr. H. T. DeWolfe had invoked the divine blessing.

Prof. W. H. Brittain followed with an instructive lantern lecture on "Sucking Insects of the Apple." Prof. Brittain never fails to interest the fruit growers of Nova Scotia and his address on this occasion was no excep tion. So well was the subject illustrated and presented that the growers were unanimous in their demand that Prof. Brittain deliver the same address at a series of meetings to be held in the various sections of the fruit growing counties. The address will be published in the columns of the Maritime Farmer in subsequent numbers.

Dr. G. B. Cutten of Acadia University and Prof. M. Cumming, were the other speakers of the evening. Dr. Cutten very humoriously remarked that while attending Acadia as a student he could make his way in the dark to the trees in the respective orchards surrounding Wolfville that bore the most luscious apples.

The Wednesday morning session was devoted to the busines of the Association. The secretary-treasurer's and auditor's reports were read by Manning K. Ells, secretary of the Association. The cash balance on hand after all bills had been paid was $182.12. The total receipts for the year including last year's balance of $193.65 was $1,063.44.

The Maritime Farmer was again unanimously adopted as the Association's official organ.

Mr. S. C. Parker gave a verbal report of the advertising committee's work. The committee's secretary, Mr. B. F. Lawson, who is at present in England, will have a full report to submit to the members through the columns of the Association's annual report.

The Election of Officers

resulted as follows:

President—F. A. Chipman, Nicteau.

Vice-President—Prof. W. S. Blair, Kentville.

Secretary—Manning K. Ells, Port Williams.

Assistant Secretary—F. W. Foster, Kingston.

Treasurer—Geo. W. Munro, Wolfville.

Executive—A. S. Banks, Berwick; S. C. Parker, Berwick; Fred. Johnson, Bridgetown; J. Elliott Smith, Wolfville.

Delegates to the N. S. Farmers' Association—Chas. Hogan and F. W. Bishop.

The Advertising Committee—A. E. MacMahon, F. W. Foster, S. C. Parker, E. H. Johnson and J. E. Shaffner, were reappoitned.

Prof. M. Cumming told the fruit growers that he had been asked to appear before the Economic and Development Commissian recently appointed by the Federal Government. He invited the fruit growers to express their wishes re any matter they would like brought to the attention of the commission. As a farming country Nova Scotia possesses assets that are not excelled by any other part of Canada. Among those mentioned were: "Precipitation of Rain," "Access to Markets" and a soil that is about the average in point of fertility, not very poor and not very rich. Fertilizers therefore have a place in Nova Scotia, if we are to procure maximum yields.

He referred to the dogfish rendering works at Canso and Clarks Harbor and the nitrogenous fertilizer there produced and asked "Shall we agitate for increased production in the fish plants referred to. What about the fish offal all along our shores? Can something be done to make it available to the farmers? Prof. Cumming also referred to the necessity of using lime commendations re matters requiring on the farms of Nova Scotia and referred to the cheap freight rates that railroads in Illinois give on this commodity. Mr. S. B. Chute referred to the 10% duty on acid phosphate as cruel as well as the 25% duty on sulphur. He thought the commission might do something towards removing these duties.

A committee consisting of S. B. Chute, Prof. M. Cumming, R. J. Messenger and A. E. MacMahon was appointed to work with the resolution committee, Chas. Hogan, S. C. Parker and Col. S. Spurr to formulate re reters requiring the attention of the inthe attention of the Economic and Development Commission.

The committee brought in the following resolutions at a later session and they were carried unanimously.

Resolved: That the N. S. Fruit Growers' Association beg to bring to the attention of the Economic and Development Commission the increased demand for dog fish fertilizer, which at present is far below the requirements, and would suggest that the possibility of increased production be dealth with.

Resolved: That whereas the Federal Government, recognizing the necessity of increased and cheaper production of the products of the farm at this time, the N. S. Fruit Growers' Association beg to bring to the attention of the Industrial and Economic Commission through the Secretary of Agriculture, the urgent necessity of placing all fertilizers on the free list, thereby enabling the farmer and fruit grower to cheapen production.

The following resolution brought in by the committee for the consideration of the Fruit Growers was also carried unanimously.

Resolved: That, weheras in pursuance of our resolutions of last year asking the local government to assist the beekeeping industry which is threatened with extinction by Foul Brood Disease, and whereas the government sent experts into our province to investigate the situation and advise beekeepers, that we, the Nova Scotia Fruit Growers' Association again respectfully bring to the attention of the Secretary of Agriculture the immediate need of having a competent person appointed to inspect apiaries and give instructions to beekeepers how to combat the foul brood disease.

And further resolved: That the local legislature at the next session be asked to pass an act for the suppression of bee diseases similar to the acts of Quebec and British Columbia.

Two excellent addresses, one on "Results Obtained at the Dominion Entomological Laboratory During 1915," by Geo. E. Saunders and the other "Fertilizing Orchards in Nova Scotia," by Prof. W. Saxby Blair, and profitable discussions on same engaged the attention of the fruit growers on Wednesday afternoon.

We have copies of both addresses and they will appear in full in future issues of the Maritime Farmer.

The opera house was crowded to the doors on Wednesday evening when an interesting debate took place on the subject: "Resolved, that the general adoption of mixed farming by which is meant the keeping of live stock and the raising of feed for the same, in addition to fruit growing, is in the best economic interest of the farmers of the fruit growing counties of Nova Scotia."

The leaders for the affirmative were: F. W. Faster and R. J. Messenger. The negative leaders were W. H. Woodsworth and A. E. MacMahon. Dr. G. B. Cutter of Acadia, acted as judge.

Messrs. S. C. Spurr, S. B. Chute, John Donaldson, A. N. Griffin, H. S. Shaw, M. K. Ells, Chas. Hogan, Ralph Creighton, A. S. Banks, R. W. Starr, Geo. McLean, and Norman Osborne took part in the discussion.

Some interesting facts and figures were furnished by several of the speakers. Mr. S. B. Chute gave figures in favor of specializing in fruit, that showed a gross income for 1915 of $21,440. Expenditures, $11,275 leaving a net balance on the year's work of $10,165. F. W. Foster gave figures that showed a tidy income from mixed farming in addition to fruit growing. Several of the speakers said that were it not for the income derived from their mixed farming operations they would have been financially embarrassed during off years in fruit growing.

Dr. Cutten's decision was in favor of the resolution.

"Some Lessons Learned from New England Fruit Growers," was the subject of an interesting talk by W. H. Woodworth, who has for the past two or three years spent considerable time as a speaker in Maine and Massachusetts.

W. B. Fawcett, Sackville, N.B., one of the largest if not the largest grower of strawberries in the Maritime Provinces, gave an instructive talk on "Commercial Strawberry Growing and Marketing," which was listened to with keen interest by the fruit growers.

M. B. Davis, assistant Horticulturist, Ottawa, a graduate of the N. S. A. C., Truro, gave a lantern lecture on "Why We Should Prune, and the Different Treatment for Old and Young Orchards." Mr. Davis is a Nova Scotian, one of our boys who is rapidly making a reputation for himself, as so many other Maritime Province men have done in the past. His lecture was the best talk on pruning ever delivered before the Nova Scotia Fruit Growers' Association. A lengthy discussion ensued and Mr. Davis answered questions and gave reasons why in a clear and convincing manner.

The last number on the programme was a paper prepared by Prof. W. Saxby Balir on "Scab Control in the Dominion Experimental Orchards in Nova Scotia." Prof. Blair was unable to be present so his assistant, Mr. Lindsay Bligh read the paper and made explanations where necessary.

PRESIDENT'S ADDRESS

Members of The Nova Scotia Fruit Growers' Association, Ladies and Gentlemen:—

At this, the fifty-second annual meeting of the Nova Scotia Fruit Growers' Association, it becomes my duty and privilege to present a report to you covering our experience as farmers and Fruit Growers during the year since we last met. Greatly have the condtiions changed and how those changed conditions have affected our interest will be the principal theme of my address.

Ordinarily it would not be necessary to give reasons why so many shillings per barrel would not give a net return of so much, inasmuch as there was a similarity of conditions covering Transatlantic shipments from all North American ports.

War conditions have made a change so great along these lines that it would seem imperative to place the actual facts before you, in order that those who are uninformed might have an exact knowledge of conditions and, further, that discouragement may not debar the Fruit Grower and Farmer of this beautiful province from thus partially reaping an advantage over their less fortunate competitors.

As I stated before, war conditions have made a different order of things necessary and we in Nova Scotia, from a financial standpoint, have not suffered from the effects but rather our conditions have been bettered on account of such heavy purchases of war material and the training of soldiers in our midst.

War has already been looked upon as something worse than the most dreaded disease. In contemplating conditions in war times, it would appear to us as being almost impossible to live and follow the usual routine of our daily duties but war in all its horrors surrounds us at the present time, and, while we do not look for an invasion of our country, yet we do feel that being an integral part of the British Empire it becomes our duty to give of our sons and our daughters and of our means, as the case may be, believing that we are doing so in defence of those principles that are dear to the heart of every Canadian, whether living in Canada or elsewhere.

It was belived by the Fruit Growers themselves, that their industry would be practically ruined during the period that war was being conducted. Such has been the case in other countries. So far Nova Scotia has occupied a superior position, as far as transportation and marketing have been concerned.

At the beginning of the present season, when the trees were in full bloom, the belief prevailed that the fruit crop of 1915 would be a record one, later in the season we realized that our anticipations would not be fulfilled. Weather conditions were unfavorable and as time passed we saw the porspect that at first looked very favorable fast disappearing and we were forced to believe that the total number of barrels would be far below the average. But, with the usual fortitude that characterizes the good Canadian, we accepted the inevitable and turned our attention to other sources of revenue in order that our necessities might be properly provided.

While the quantity of fruit is, and we suppose will continue to be the first consideration, yet we are pleased to know that a great many of our up-to-date Fruit Growers consider quality should have the preference, with the result that they have been successful in making a favorable comparison with seasons that were better adapted to clean fruit and when we consider that proper spraying increases quantity as well as quality, we can readily see the benefit of the investment.

Weather conditions were such during the past season that it became necessary, in order to obtain good fruit, to make constant and scientific use of the power sprayer. When this was done clean fruit in most cases was the result and, when we consider the increased cost of marketing, the facts are brought forcibly to our attention that we cannot afford to grow fruit of an inferior quality. Mr. Sanders will later place facts and figures before you that cannot fail to be absolutely convincing in every respect.

We do not feel that the Fruit Growers of Nova Scotia fully appreciate the good work done by Mr. George Sanders, our popular entomologist. Ever busy, never failing to encourage spraying, pruning and proper attention to

the cultivation of the soil, always willing to give information of value, he certainly has become almost indispensable in connection with the Fruit Industry of Nova Scotia and occupies a position, the value of which cannot be over-estimated.

The potato crop, although light has been remunerative. High prices have prevailed since the beginning of the season and the same continue strong The present prospect is that record prices per barrel will be obtained.

To return to my introductory remarks concerning the comparatively favorable conditions enjoyed by the Nova Scotia Fruit Grower, it is my intention to place before you a table showing the comparative rates prevailing from various ports to the markets of Europe covering a period of three years. These tables will set forth the advantageous position of Nova Scotia and show you that our location has been the means of giving us a service better than that obtained by any fruit producing country in North America and that the expenses necessary for transportation and marketing are much less than those enjoyed by any fruit producing country using the same markets.

In discussing the fruit situation with many growers, I find an air of discouragement prevailing. The common expression being, "What will we do with our fruit next year?" The same expression has been used as frequently during the past two years, or since the war commenced. So far as we know and believe the price of fruit in Nova Scotia has not been materially affected on account of the war. Ontario has been unable to compete with us on a favorable basis as far as expense is concerned, while they have not had a regular line of sailings during the season; Nova Scotia has not only enjoyed a fairly regular service to England, but has been able to make full use of the home markets placing a much larger quantity on this side of the Atlantic than many would have deemed possible. We believe that the thanks of the Nova Scotia Fruit Growers are due to Messrs. Furness, Withy & Co., who under adverse conditions have rendered us such admirable service compared with that of other countries and also for the comparatively low rates that have existed from the Port of Halifax during the present season.

We wish to record our appreciation of the active interest taken in the handling of our fruit by Mr. J. E. Furness, the Canadian manager of their service, and we believe that had it not been for his personal influence, instead of paying but five shillings per barrel, the rate from the port of Halifax would have been equal to the rate from the ports of Montreal. The labor question in London has very seriously hampered operations. In some cases ships have been as long as thirteen days in discharging their cargoes. This state of affairs has been brought about by the fact that there is a great scarcity of male help, so many having enlisted and are serving their country at the front. An attempt was made to remedy matters by introducing women laborers but the men who were employed immediately went on strike so that it became necessary to discontinue the idea.

This shortage of labor constitutes one of the many draw-backs to the obtaining of better prices on the London market during the present season and we believe that while we are as vitally interested in the present war as England herself, yet we realize the fact that we are not making our interest as peronal as is the case in the Mother Country. Clerks have enlisted to such an extent that business has been almost brought to a standstill and in some cases our own funds are held over for days and sometimes for weeks before we are able to get settlements. However, we do not consider it right or wise for us to make complaint along these lines. We feel it our duty ot accept conditions as they are and do the best we can.

The Table that I am giving you below will make the Fruit Growers understand how much more favorable their position is than that of the Fruit Growers in the countries which I have already mentioned and feel that we should go forth with renewed efforts propogating and developing this great industry that has become famous throughout the world.

Nova Scotia apples reckoned at 15s.; Ontario and American at 18s.

We will examine these tables for a few moments, although they are practically self-explanatory.

The first pecularity will be immediately apparent to all, namely, the tremendous advantage of Nova Scotia over all her competitors. Our proximity to the Atlantic seaboard with an open harbor all the year round and our nearness to the world's greatest market will always be our greatest asset.

With the exception of the State of Maine, we have a great advantage in the cost of rail haul; we have a shorter ocean trip and government subsidized fruit boats, which ensure for us a better freight rate that than enjoyed by our competitors.

We therefore have an advantage by virtue of our location that places us in a position which can be calculated as 53c to 78c per barrel over the State of Maine; 64c to 89c advantage over Western New York; 67c to 80c over Ontario.

An examination of the second table will show, however, that owing to war conditions, it is costing us 65c per barrel more to place our fruit in the hands of the wholesale trade in England than it did in 1912.

A peculiarity of this table is noticed in the comparison given between the years 1912-13 and 1913-14; in the latter year, while the ocean freight was higher, yet the total cost of transportation was no greater than in the case of the former, owing to the fact that cartage and handling charges were reduced in London.

The Nova Scotian apple has fast become popular and we believe will continue to be so during the coming years. The quality of our pack being so much improved appeals with more force to the consumer. We believe the campaign put on by the Dominion government advising the people to eat fruit has had a marked effect and we have every reason to feel satisfied that, no matter what conditions may be in the future, the Fruit Growers of Nova Scotia will be able to hold their own with any fruit-producing country in the world.

At the last Annual Meeting of The Nova Scotia Fruit Growers Association a committee was appointed to interview the Fruit Commissioner in connection with the construction of a building for the purpose of conducting experiments along entomological lines. Mr. Johnson promised to take the matter up with the government and recommend the same. As a result and also through the hearty co-operation of Dr. Hewett, we have the building and we believe the information obtained as a result of the experiments by Mr. Sanders will be appreciated by all.

We also wish to record our appreciation of the prompt attention given this mtater and other matters appertaining to the fruit industry by the present Fruit Commissioner, and also to express the opinion that he is the right man in the right place.

Your committee appointed to take charge of the advertising campaign have followed your instructions with the result that Mr. Lawson is now in England obtaining information and we believe inaugurating a policy that must be of immense value to the Fruit Growing Industry of Nova Scotia. His report will be submitted later.

Another matter that has claimed our attention was the ntoice given by the Dominion Atlantic Railway Company that on and after the 10th day of October an increased rate on fruit to Halifax would be in force. Mr. W. H. Chase suggested that a delegation should meet with Mr. P. Gifkins, general manager of the Dominion Atlantic Railway Company, and enter a strong protest against the increase. As a result, Mr. Cahse, Mr. Oyler and myself interviewed Mr. Gifkins and laid our case before him. We were informed that the Railway Commission was the only body who could adjust that matter as the railway company had already forwarded the amended tariff for their approval. We immediately notified the commisison that we would be prepared to place objections to the proporsal of the Dominion Atlantic Railway Company before them at their earliest convenience. The railway commission notified us that they would be pleased to hear our arguments on October 22nd at Kentville.

A large number of gentlemen representing the Fruit Industry appeared before them and made a strong appeal against any charge in the railway tariff at the present time and especially under existing conditions, but our arguments were of no avail The commission upheld the recommendations of the railway company.

While we do not consider the increase (one-half cent per barrel) to be worthy of too much attention, yet we do feel that it was and is a stepping stone to the general policy of increases along various lines with which the fruit growers are most intimately concerned. In our opinion the classification of fruit under present rates is altogether too high. We are informed that a re-arrangement of the general classification schedule will be made by the railway companies of North America within a short time and I would earnestly suggest that The Nova Scotia Fruit Growers' Association be strongly represented and that all that can be done to place the freight on fruits in the proper classification be done.

Ladies and Gentlemen: I thank you for the honor conferred upon me at your last annual meeting and for the privilege of having enjoyed the distinction of being your president during the past year. I trust that your deliberations during the session may be of benefit and that good may result therefrom. We are now passing through the most trying experience, as a nation, and may the same spirit that prevails in the front of the Battle in which our soldiers are engaged, permeate our home life in order that our full duty may be done.

Boiling in Creosote Preserves Fence Posts.

Heating Process Insures Better Penetration of Fluid Than Painting or Dipping

"The fence post problem is becoming important," says Prof. W. J. Morrill, of the Colorado Agricultural College. "Good material is very expensive. Pitch posts, once purchased for as little as ten cents each, now bring 35 to 40 cents—but they alst a generation.

"Idaho cedar posts cost around 15 cents, but they last only four or five years. The increasing cost of wood posts has brought the iron post and the cement post on the market. There are serious objections to both of them, because of cost, weight, difficulty of attaching wire, and the crumbling of cement in alkaline soils.

"The railroads have been preserving ties for many years, the telephone companies have reduced their annual cost per pole by treating the butts of their poles, and at last the farmers are beginning to preserve their fence posts. Coal tar creosote of a grade that is not heavy, and in penetrating, is used largely. While the railroads preserve their ties by forcing creosote oil into them by hydraulic pressure in closed tanks, the farmer has to cotnent himself by using atmospheric pressure in open tanks. This is done by boiling creosote for from one-half to three or four hours, according to the species of wood, and then letting the posts cool in the liquid.

"The heat forces a part of the air out of the wood, but as the cost cools, the air that is left in the wood contracts and a partial vacuum thus formed forces the creosote into the wood for a quarter or half an inch or more; at any rate, further than the penetration gained by merely painting or dipping.

"These last methods, however, are worth while, if the farmer is not prepared to use the "open-tank" method. A farmer can save half his post expenses by using preserved posts. Often he can do better than this by utilizing cottonwood, willow, soft maple, and other wood he can grow on his farm, and make last for 15 or 20 years by creosoting them."

Watch the horse in the barn when he starts to pull back on the halter, and just when he has the rope stretched good and tight hit the rope sharply with a pitchfork handle or something of the kind. This will give him a sharp shock and often will induce him to abandon the habit.

THE MARITIME FARMER.

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

DISTRICT REPRESENTATIVES WORK.

Among the activities promoted and encouraged by The Agricultural Instruction Act, now in its third year of operation, having come into force in June, 1913, as detailed in the report recently presented by the Commissioner of Agriculture, and which can be had on application to the Publications Branch, Ottawa, there is none that exceeds in influence and usefulness the work done by the District Representatives. Their duties are manifold and unceasing, but their helpfulness in the agricultural industry is abundantly testified to in every district where they have been appointed, and there are now 45 of them in Ontario alone. It is theirs not only to be ever ready with counsel and advice on farming subjects but also to manifest a live and active interest in every undertaking having for its object the better cultivation of the land, the increase of productiveness, the development of the live stock industry, the improvement and etxension of educational facilities, the social uplift of the people and the welfare of the agricultural community generally. In short their usefulness can hardly be over-estimated, and towards their support the funds forthcoming from the ten-million dollar grant provided to be distributed among the provinces during a term of ten years under The Agricultural Instruction Act, is largely devoted. All this is fully detailed in the Report of the Commissioner previously referred to and which affords instructive reading. Taking the provinces separately we find that the amounts directly utilized for this purpose in 1914 were:

Prince Edward Island	$ 4,000
Quebec	10,000
Ontario	80,000

In most of the other provinces the system has not yet been organized under the title of District Representatives, but in all of them the funds allotted find a somewhat similar disposition in furnishing means for the promotion of demonstration work. In Nova Scotia $4,200 was so employed in 1914 and in New Brunswick $14,200 under the title of travelling instructors. In Manitoba upwards of $30,000 of the grant of $51,720 was disposed of by means of demonstrations. In Saskatchewan $27,148 and in Alberta $14,594 practically went the same way. In British Columbia $27,500 was devoted to demonstration work. In Prince Edward Island, Quebec and Ontario besides the amounts mentioned as directly used in the maintenance of the District Representative system substantial sums were also supplied to demonstration purposes.

THE FARMER WHO USES HIS HEAD.

Charles H. Meiers.

It isn't just sowing the right kind of seeds
That wins; for good seeds may be sown
In soil that may give up its life unto weeds
Which claim the seed bed as their own;
It isn't the skimming o'er many broad fields
That brings home the bacon and bread:
It's isn't the numskull that gets the big yields—
'Tis the farmer who uses his head.

It isn't the farmer who tills the most soil
That gets the best pay for his work;
It isn't a question of how much men toil,
Although it will not pay to shirk.
The man who succeeds is the fellow who tries
To learn the best methods, instead
Of plodding on blindly; he tries to "get wise"—
The farmer who uses his head.

DEVELOPING THE BOY AND GIRL.

Of the activities encouraged and promoted by funds provided under The Agricultural Instruction Act of the Dominion none is more worthy than the improved means which have been made possible for the development of the juvenile mind. There is but one way that the boys and girls can be rivetted to the soil and that is by strengthening their attachment for it. This can only be accomplished by the inculcation of knowledge presented not altogether in utility fashion but in a manner that will emphasize the brightness, the wonder and the attractiveness of the works of nature. This the boys' and girls' clubs are doing; this the school fairs are doing. This the nature study classes in the public schools are doing; this the school gardens are doing. They encourage association and sociability in the first instance, a desire for emulation in the second, a favorable disposition for the outdoor life in the third and an appreciation not only of the marvels, but also of the beauties, of creation in the fourth. All four divisions of the work receive substantial support in every province from the grants derived under the Agricultural Instruction Act. In Prince Edward Island, the sum devoted to these purposes in 1913-14, the first year the Act was in operation, was $5,529; in the third year, or in 1915-16, it is $10,050. In Nova Scotia the sum thus employed under the Act in 1913-14 was $6,700; in 1915-16 it is $10,000. In New Brunswick in the first year it was $1,500. In the third year it is $10,000. In Quebec the first year it was $3,000, in the third it is $8,000. In Ontario it was $10,000, it is now $20,000. In Manitoba it was $2,000, it is this year $5,200. In Saskatchewan it is $2,100. In British Columbia $1,000 was so used in 1913-14, but this year for boys and girls competitions, fairs, etc., and instruction in public schools, $17,000 is to be spent from the grants. It must be understood that while in some of the provinces the money is directly employed for the purposes set forth, in others it is used in other ways and the sums required for school fairs, school gardens, and so on, are received from provincial and municipal sources. The figures, however, are in themselves abundant indication of the far-reaching benefits conferred by the Act.

AID TO AGRICULTURAL COLLEGES AND SCHOOLS.

The grants under the Agricultural Instruction Act being supplemental to those from provincial and other sources make many things possible that otherwise would be considered impracticable by reason of the expense involved. In particular are they valuable in the prosecution of the higher education in agriculture. By the help of these grants not only are agricultural colleges and schools made more efficient in equipment, but it is made possible to pay men of first class information and experience salaries becoming to their station. Further graduates who have passed with honors and obtained degrees in our own colleges and universities are induced to stay in their own country rather than to go abroad in search of remuneration to which their ability entitles them. Indeed, several good men have already been repatriated and have accepted lucrative engagements in the land of their birth. How far the funds are being used in this direction is indicated by the following appropriations made from their allotments for 1915-16 by the different provinces immediately for schools and colleges, apart from extension work, short courses, demonstrations, etc.:

Prince Edward Island	$ 10,050
Nova Scotia	27,500
New Brunswick	16,500
Quebec	60,000
Ontario	93,813
Saskatchewan	22,800
Alberta	38,000

Manitoba and British Columbia apply portions of the fund in a similar way but through the public, normal and high schools, and thus the grants appear under another heading than agricultural schools and agricultural colleges.

GOOD READING MATTER.

One of our readers makes the statement that advertising is good reading matter. He is right too. A great deal of time and thought is spent on the writing of advertisements; we once heard an advertising man tell how he and two others spent a whole evening writing seven words. That being the case, ads. ought to be good reading matter.

After one starts the practice of reading advertisements, he soon finds that they contain very interesting reading. They keep us up to date on all the newest things on the market. In them we can frequently find valuable ideas and suggestions. They bring us into closer touch and sympathy with the advertisers.

Read more of them and see for yourself. If habit of reading the ads. as well as the articles.

"A friend in need is a friend indeed," is as true today as it was years ago. Farmers who organize because they are in need and when the organization has been a friend, desert the movement, have not yet learned to know the force of the above saying.

N. A. S. C. Short Courses.

The Short Course at the College of Agriculture, Truro, N.S., which was conducted from January 4th to 14th last, was one of the most successful of the whole series of courses which have been conducted at this institution during the past eleven years. It was to be expected that the large military enlistment would result in a somewhat reduced attendance, and yet 205 enrolled in the men's short course and 50 enrolled in the women's short course; especially when it is considered that all but some four or five came from the province of Nova Scotia alone this must be regarded as a very high attendance. A striking feature was the large attendance from some of the more distant parts of the province which had not previously been represented at the College.

The greatest interest in the course centered around the instruction in the care and management and judging of dairy cattle, in the selecting and judging of seed, and in the information which was given relative to the use of ground lime stone. With respect to the first the inspiration afforded to the students by studying the magnificent collection of dairy cows which are now housed at the college stables was sufficient in itself, especially when among the number were several cows that had given over 15,000 lbs. of milk during the year, an done that will complete her year's work with nearly 23,000 lbs. of milk to her credit. At the time when the short course was in sessions the cows were being fed ensilage made from oats, peas and vetch, or as Professor Trueman calls it O. P. V. ensilage. This mixture has given excellent satisfaction where lack of heat and danger of frost makes corn an uncertain crop.

In regard to the use of lime stone, the results of Professor Trueman's experiments on the college farm were extreemyl interesting. The most striking experiment was that with clover, two half acre plots of which averaged 1¼ tons more clover per acre on limed areas than on adjoining unlimed plots. However, on a very rich piece of land where the same experiment was tried practically no difference was noted, and on the very poor areas the difference was very small indeed. Practically all the soil on the College farm gives a slight acid reaction to the litmus test, as do most soils in Nova Scotia which have been investigated by the College Chemist. This indicates the necessity of liming. That the college management believe in their experiments is indicated by the fact that they are this year applying to various fields upwards of 150 tons of ground stone. Provided the material can be purchased reasonably enough they do not hesitate to advise any farmer in Nova Soctia who is trying to permanently build up the fertility of his farm to use ground lime stone at the rate of 3 to 4 tons per acre. Contrary, however, to a good many statements which have appeared elsewhere, the college management points out the fact thta these striking results from the application of ground limestone have been on the lighter, sandier soils from which analyses show the lime stone has in the course of years been leached out.

From beginning to end, the seed judging classes which were conducted by T. G. Raynor of the Federal Department of Agriculture were followed with the closest interest, for farmers have come to recognize that if they would produce bigger crops without any more labor to assist them, one of the most vital points is the securing of better seed.

There were many other striking features at the short course, including a very practical lecture given by G. C. Cunningham of the Federal Department of Agriculture on club root in turnips and cabbage. He gave the results of five years' practical experiments conducted with this disease by himself in the State of Vermont, and concluded his very positive lecture by stating that "he would stake his life that lime stone would cure club root," although he added it might take two or three years before the cure would be complete.

During the short course, the new Science Building which had just been completed, was formally opened by Dr. C. C. James who gave a most practical and helpful talk on that occasion, directing especially his remarks to the delegates of the Womens' Institutes who were present. The following day he held what he called a "council of war" which was attended by some 250 farmers and farmers' sons at the college who listened with the greatest of appreciation to his recruiting agricultural speech. He told them that the problem of 1915 was a simple one in comparison with 1916 when the call for production is just as great, but the means of producing very much reduced.

Space prevents our referring to other striking features of the course such as the lectures and demonstrations on sheep judging and management conducted in horse judging, care and management by Dr. J. A. Sinclair, who is now a member of the staff at the Agricultural College; the fruit packing demonstrations conducted by P. J. Carey, of the Federal Department of Agriculture, the practical instruction in fruit growing given by Saxby Blair of the Kentville Experiment Station, and all this in addition to the instruction given by the well known members of the college staff itself.
